Officers. The chief officers of the State, serving in 1935, were: Governor, Charles H. Martin; Secretary of State, Earl Snell; Treasurer, Rufus C. Holman; Attorney-General, I. H. Van Winkle; Superintendent of Public Instruction, Charles A. Howard.

Judiciary. Supreme Court: Chief Justice, James U. Campbell; Associate Justices, Harry H. Belt, George Rossman, Percy R. Kelly, John L. Rand, Henry J. Bean, J. O. Bailey.

OREGON, UNIVERSITY OF. A coeducational institution under State control and support at Eugene, founded in 1876. The total enrollment for the fall term of 1935 was 2741. The attendance at the 1935 summer sessions was 1443. The instructional staff for the fall term numbered 210. The total income for the year ending June 30, 1935, was \$738,765, exclusive of gifts. The library contained 253,462 volumes. President, Clarence Valentine Boyer, Ph.D.

OREGON COAST BRIDGE. See BRIDGES.

OREGON STATE AGRICULTURAL COLLEGE. The Federal landgrant college of Oregon, established under Federal and State support at Corvallis in 1868. In the reorganization of Oregon higher education, inaugurated in 1932, the State College has been made the centre of science and professional and technical schools based upon the natural sciences. The enrollment for the autumn term of 1935, excluding duplicates, was 3141. The 1935 summer session enrollment was 517. There were 292 members on the resident teaching faculty. The library contained 134,808 catalogued volumes. Important gifts to the college during 1934-35 included 2000 additional fine and rare books from Mrs. Mary J. L. McDonald, together with walnut paneling, leaded windows, and Jacobean furnishings for the McDonald room of the library; and numerous other gifts and allotments totaling approximately \$140,000. President, George Wilcox Peavy, M.S.F.

ORIENTE DISPUTE. See ECUADOR and PERU under History.

ORT, WOMEN'S AMERICAN. A society organized in 1927 for constructive relief for the Jews of Central and Eastern Europe. It is derived from the organization Ort (the initials of three Russian words meaning Organization for the Promotion of Trades and Agriculture), founded in 1880 by prominent Russian Jews, such as Baron H. Ginzburg, S. Poliakov, and Prof. N. Bakst. Among its activities in 1935 were the support of technical and vocational schools for youths and adults of both sexes; the purchase of agricultural implements, seeds, and livestock for Ort colonies; and the supplying of tools and machinery to artisans.

The Women's American Ort in 1935 raised a spe-

cial fund whereby thousands of Polish artisans were enabled to continue plying their trade. Special courses were established to train Jewish artisans to take the new government examinations and obtain the governmental certificate required of every artisan the fee for which amounted to \$8.50.

Ort established in 1935 emergency trade courses in Paris for German Jewish refugees and an agricultural settlement in Southern France for refugees. German Jewish youths were sent for technical training to Ort schools in Lithuania, Latvia, and Poland. The society maintained a guardian bureau to finance orphans through a three-year course in vocational schools. World headquarters of the Ort are in Paris, France. Branches are maintained in England, Rumania, Latvia, Lithuania, Germany, Poland, South Africa, the United States, Canada, and Russia. The offices of the Women's American Ort are at 220 Fifth Avenue, New York City.

OSBORN, Öz'börn, HENRY FAIRFIELD. An American paleontologist, died at Garrison, N. Y., Nov. 6, 1935. Born in Fairfield, Conn., Aug. 8, 1857, he was graduated from Princeton University in 1877, where his interest in geology led to his being given charge of the paleontology section of the Princeton expedition to Colorado and Wyoming in 1877-78. The fruits of this expedition were the subject of his first papers on paleontology. Subsequently he studied anatomy and histology at the College of Physicians and Surgeons and Bellevue Medical College, New York; embryology under Francis Balfour at Trinity College, Cambridge, and comparative anatomy under Thomas Huxley at the Royal College of Surgeons, London. In 1880 he received a fellowship in biology at Princeton, and in the following year was appointed assistant professor of natural sciences there. In 1883 he was professor of comparative anatomy but resigned in 1890 to join the faculty of Columbia University, New York.

His first post at Columbia was Da Costa professor of biology, and in 1896 he was made professor of zoology, holding that position until 1910 when he retired as research professor. During the 20 years of his connection with that University he organized the Zoological Department; planned various scientific expeditions; instituted the Columbia Biological Series, and edited the first 10 volumes; served on the board of the Columbia University Press; in 1895 delivered the inaugural course of public lectures on biology, later published in *From the Greeks to Darwin* (1894); and from 1892 to 1895 served as dean of the faculty of pure science.

In the same year that he joined Columbia, he began his long and honorable association with the American Museum of Natural History in New York. His first post was as curator of the Department of Vertebrate Paleontology, which he founded, and under his direction the most extensive collection of vertebrates extant was made. These were mostly obtained by the various expeditions sent out by the Museum in the years 1893, 1897, 1903, and 1906-10, in the success of which Dr. Osborn was a potent factor. The expedition of 1906 yielded the only known specimen of tyrannosaurus, and the Fayûm Expedition into the Libyan Desert of 1907, which he personally arranged and directed, produced two of the earliest stages of the elephant. To him must go the credit of making the Museum's fossil collection an example to other organizations, for by his attractive grouping and posing of the exhibits, their teaching value was raised.

During his administration as curator, he also served as assistant to the president (1899-1901)

and as vice president and trustee (1901-08). He was elected president in 1908 and two years later retired as curator to devote himself more to the administrative side of the Museum's work. On Jan. 10, 1933, he retired as honorary president. Under his capable administration of the Museum's work, its size and scope were greatly enlarged; various departments added and expanded; the Museum journal and the memoir series of publications established, and the present administrative plan of the Museum inaugurated.

Dr. Osborn was also vertebrate paleontologist of the U.S. Geological Survey (1900-24), and senior geologist from 1924. During this period of association with the Survey, he produced the stupendous work, *The Titanotheres of Ancient Wyoming, Dakota, and Nebraska* (Monograph No. 55 of U.S. Geological Survey), begun in 1900 and delivered to the Survey in 1920. In December, 1929, the two-volume work was published. For four years (1900-04) he was a member of the Canadian Geological Survey. Another of his outstanding services to science was his work in connection with the New York Zoological Society, as chairman of the executive committee (1896-1903, 1907-09), vice president (1897), and president (1909-23). In 1906 he was unanimously elected secretary of the Smithsonian Institution, but declined because of the many demands already made upon his time.

Dr. Osborn's early studies dealt particularly with the history of mammalian teeth, from which he prepared a distinctive nomenclature, which brought order to the confusing and conflicting terminology then in existence. In 1907, he issued *Evolution of Mammalian Molar Teeth to and from the Triangular Type*. Also, he developed a theory of "determinate variations," which he called the doctrine of "rectigeneration" in the evolution of organisms. This was not to be confused with the theories of either Eimer or De Vries. Afterward, in the study of the origin of horns and other organs, he found this same principle of hereditary ancestral control of variation illustrated. It was he who gave the first emphasis to "adaptive radiation." In 1923, he described the progression of evolution before the National Academy of Sciences. His principles of adaptation were neither theories nor hypotheses but facts obtained from paleontological research. His own findings in regard to evolution led him to a new principle which he held to be fundamental to the evolution of organisms—"tetraplasy," or "the law of the four inseparable factors of evolution."

For over 50 years, Dr. Osborn was engaged in the preparation of monographs on the rhinoceroses, horses, titanotheres, Sauropoda, and the Proboscidea, during which time he issued numerous papers on these subjects. Among these may be mentioned: "The Extinct Rhinoceroses" (1898); "The Four Phyla of Oligocene Titanotheres" (1902); "New or Little Known Titanotheres from the Eocene and Oligocene" (1908); "The Horse Past and Present in the American Museum of Natural History" (1913); "Lower Eocene Titanotheres" (1913); "Equidae of the Oligocene, Miocene, and Pliocene of North America" (1918); "Camarasaurus, Amphicoelias, and Other Sauropods of Cope" (1921).

His writings, while dealing with scientific minutiae, indicate an ease of intellectual movement in fields appealing to a varied group and interest in general problems. His many biographical notices show a deep penetration into sources of human

character and personality, which derive from his long studies in heredity and the varied racial characteristics of humanity. Of his imposing list of titles, the following volumes may be mentioned: *The Age of Mammals in Europe, Asia, and North America* (1910); *Men of the Old Stone Age* (1915, 1918); *The Origin and Evolution of Life on the Theory of Action, Reaction, and Interaction* (1917); *Impressions of Great Naturalists* (1924, 1928); *The Earth Speaks to Bryan* (1925); *Evolution and Religion in Education* (1926); *Creative Education in School, College, University, and Museum* (1927); *Man Rises to Parnassus* (1927); *Cope, Master Naturalist* (1931); *Proboscidea: Discovery, Evolution, Migration and Extinction of the Mastodonts and Elephants of the World* (1st vol., 1936).

A member of scientific societies the world over, Dr. Osborn received many honors for his work in vertebrate paleontology and other fields. Colleges and universities conferred degrees upon him, and he was awarded, among others, the gold medal of the National Institute of Social Sciences (1913); the Hayden Memorial Geological Award of the Academy of National Sciences (1914); the Darwin Medal of the Royal Society (1918); the Gaudry Medal of the Geological Society of France (1918); the Cullum Geographical Medal of the American Geographic Society (1919); the Roosevelt Medal (1923); the Holland Society Medal (1935); the Wollaston Medal of the Geological Society of London (1926); and the Daniel Giraud Elliot Medal of the National Academy of Sciences (1929).

OUTER MONGOLIA. See MONGOLIA.

OWRE, ALFRED. An American dentist and educator, died in New York City, Jan. 2, 1935. Born in Norway, Dec. 16, 1870. He was brought to the United States when a small child, was educated here, and graduated from the University of Minnesota with the degree of doctor of medical dentistry in 1894, and M.D. and master in surgery from the College of Physicians and Surgeons, Hamline University in 1895. In 1929 he received the degree of D.Sc., from Columbia University.

Dr. Owre taught in the College of Dentistry, the University of Minnesota, serving as student assistant in operative dentistry, 1893-94; instructor in dental metallurgy, 1895-96; instructor in operative dentistry and dental metallurgy, 1896-97; clinic professor of operative dentistry, 1899, and dean and professor of theory and practice, 1905-27, being credited with making the School of Dentistry at the University of Minnesota one of the finest in the world. In 1927 he became dean of the School of Dental and Oral Surgery of Columbia University, and professor of the theory and practice of dentistry, but resigned in June, 1934. It was his belief that dentistry should never have been separated from the profession of medicine as one required a complete knowledge of the other. He established a four-year dental course with a grounding in medicine at Minnesota, and when he came east to Columbia reorganized the curriculum and planned a drive for \$1,500,000 to complete his plans.

He was intensely interested in the subject of decay in teeth and its elimination, and while at Minnesota wrote *Prunes or Pancakes*, a book expounding his views on the relation of proper diet to the care of the teeth. While at Columbia his researches were considered to have disproved the theory that "a clean tooth never decays." In 1930, he received a grant of \$105,000 from the Commonwealth Fund—the largest ever made for dental research—to con-

tinue his three-year researches in the cause of decay in teeth. Although he never completed them, he felt that he had done sufficient to prove that decay could be overcome by proper diet. His later researches were directed toward the study of dental pulp, a subject about which comparatively little is known by scientists.

In 1931, in his annual report to Dr. Nicholas Murray Butler, president of Columbia University, Dr. Owre assailed practicing dentists for their opposition to his plans for a system of low-priced dental clinics, through the fear of loss of patients rather than because the system was unsound. A year previous to his retirement he had gone abroad to study dentistry in the Union of Soviet Socialist Republics, Austria, and Germany. He was a frequent contributor to magazines and newspapers on subjects relating to dentistry.

PACIFIC RELATIONS, INSTITUTE OF. An organization formed in Honolulu in 1925 to serve as an unofficial body in studying the conditions of the Pacific peoples. It is governed by a Pacific council, consisting of one representative from a recognized affiliated body of similar purposes in each country, including Australia, Canada, China, Great Britain, Japan, the Philippines, New Zealand, the United States, and the U.S.S.R. The national councils conduct its educational and research activities.

During 1934 and 1935 the American Council centered its research programme in the field of "Standards of Living," which will be one of the special topics for discussion at the next Institute conference in 1936. The research department expanded its memoranda service into *The Far Eastern Survey*, a fortnightly publication carrying in each issue one long study and several shorter items on matters of current interest. The leading articles have covered such subjects as the following: The Crisis in the Chinese Cotton Industry; The Current Boom in the Japanese Steel Industry; Industrialization of the Soviet Far East; Japan as a Consumer of American Cotton; Japan's Penetration of Latin America; Philippine Copra and Coconut Oil in the American Market; Export Control in Japan.

Other publications of the Institute and the American Council which appeared during 1935 were: *Commodity Control in the Pacific Area*, edited by W. L. Holland; *Trade and Trade Barriers in the Pacific*, by Philip G. Wright; and *The Future of Sea Power in the Pacific*, by Walter Millis. *Pacific Affairs*, the Institute's quarterly magazine, during 1935 published articles dealing with various aspects of the naval question, Communism in China, studies of Manchurian and Mongolian problems, and a variety of other questions in their Pacific setting.

A second intensive course in the Russian language was given under the auspices of the American Council, in connection with the Columbia Summer School of 1935.

Among the officers of the American Council are: The Honorable Newton D. Baker, chairman; Frederick V. Field, secretary; Dr. Carl L. Alsberg, chairman of the research committee; Charles J. Rhoads, treasurer. Headquarters are at 129 East Fifty-second Street, New York, N. Y.

PAHANG. See FEDERATED MALAY STATES.

PAINTING. Under Government patronage and impetus of relief projects there was exceptional activity in the field of painting in 1935. The PWA Project which set over 3000 painters to work in 1934 came to an end before that year was half run, but the painters who had thus been encouraged to produce did not lay aside their brushes. Exhibi-

tions of their works were shown throughout the country and many who had never thought of exhibiting before proudly offered crude and feeble efforts for the inspection of the public. Standards were very much lowered, judgment of the immature was most lenient, and much inferior painting was shown under really distinguished auspices. But aside from all this the art of painting was conspicuously affected in 1935 by influences from outside, which as individual tributaries swept into the main stream. These were African Negro sculpture; paintings by Cezanne, Gauguin, Van Gogh, brought over from France; examples of our own "Primitive Art," the untutored production of simple-minded people of early days in America; and "Currier and Ives" prints with their Victorian drollery and emphasis on the "American scene." Consciously, or unconsciously, there was a tendency to dehumanize art by taking it out of the realm of purely visual expression and give it psychological affirmation; and, paradoxically, at the same time to return to the frankly illustrative. In Paris and in New York exhibitions of *genre* paintings were held with the announced purpose of inducing a return to subject pictures. The Government's insistence upon representation of the "American scene" in all work done under its auspices and in programmes of competitions for murals contributed to the same end.

The three American painters outstanding and most discussed in 1935 were Grant Wood of Iowa, realist who in a measure harks back to Holbein; John Steuart Curry, born in Kansas, painter of theatrically dramatic scenes of western life, and Thomas H. Benton, a Missourian, whose paintings of farm life won many prizes in exhibitions voted by professional juries to the mystification of the public which still regards art and beauty as synonymous. Next to this trio in prominence came Charles Burchfield and Edward Hopper, both realists and strong painters given to the representation of that which is typically homely.

The first official act of the Painting and Sculpture Section of the Procurement Division of the Treasury Department, set up in October, 1934, was to appoint 10 painters and 2 sculptors to execute mural paintings and sculpture for the new Post Office and the new Justice buildings in Washington, after which competitions were announced for additional paintings and sculpture for the same purpose. The original appointees were—painters, Thomas H. Benton, George Biddle, John Steuart Curry, Rockwell Kent, Leon Kroll, Reginald Marsh, Henry Varnum Poor, Boardman Robinson, Eugene Savage, and Maurice Sterne. Two years were allowed them to complete their works. Early in October, 1935, the competitions bore fruit. For murals in the Post Office, 315 designs were submitted by 142 painters, and for murals in the Justice building, 90 designs were submitted by 55 painters, the results of approximately four months' work. The jury, consisting of Edward Bruce, Olin Dows, Leon Kroll, Bancel LaFarge, Jonas Lie, Ernest Peixotto, Henry Schnackenberg, and Eugene Speicher, rejected all those for the Justice building, thereby calling down a sharp letter of criticism and complaint from The Mural Painters' Society, in which this particular competition was characterized as "a colossal and expensive failure," and accepted the designs submitted for the Post Office by the following artists: Alfred D. Crimi, William C. Palmer, Frank Mechau, George Harding, Ward Lockwood, Karl Free, Doris Lee, and Tom Lea, the last two being asked to "redesign." After this competition closed other appointments followed—21 paint-

ers among the unsuccessful competitors being appointed to do murals for other public buildings on the recommendation of the jury, and 22 being appointed on the initiative of the Painting and Sculpture Section. The last of October all of the winning designs in this competition as well as many of those rejected, a few of the designs by original appointees, and winners in local competitions, were placed on public exhibition for a period of three weeks in the Corcoran Gallery of Art at Washington.

Meanwhile two new agencies—relief measures—for the aid of artists were set up by the Government in 1935. The first of these, under Messrs. Bruce, Dows, and Watson, of the Painting and Sculpture Section, out of an appropriation of \$530,784 gave employment to 450 artists decorating Federal buildings not invariably new. The second, broader in scope but slower to get into action, was under the Works Progress Administration and a part of its \$300,000,000 "white collar" programme. To the art section under Folger Cahill, \$6,000,000 was allocated for the employment not only, however, of painters but of educationalists in this field. Both of these agencies were set up for only one year. What their effect will be upon the art of painting in the United States can only be surmised. It is of interest to note in this connection that all these activities on the part of the Federal Government have chiefly benefited the submerged and thus have greatly increased the volume of production for which only a temporary and unstable market has been created. However for mural painting and painters, 1935 will always be remembered as epoch marking—a time of unheard-of demand and patronage.

Among numerous mural projects, mention should undoubtedly be made of a painting in egg tempera 70 ft. long by 35 ft. in height executed by Thomas Loftin Johnson, a Yale graduate, on the wall of the new Mess Hall of the U.S. Military Academy at West Point which represents a Military pageant, fighting men of all the world. Also of a mural in the same medium 125 ft. long by 10 ft. high in the McKinley High School, at Washington, representing intellectual and physical progress, also by a Yale School man, Philip Fletcher Bell—his first commission.

For Roosevelt Memorial Hall in the American Museum of Natural History, New York, William Andrew Mackay executed a series of large mural paintings depicting Theodore Roosevelt's travels and explorations.

The Mural Painters' Society held a notable exhibition of mural paintings and studies in the Grand Central Galleries, New York, in February, 1935.

One of the paintings shown in The Mural Painters' Exhibition in the Grand Central Galleries was by Ben Shahn, depicting prison conditions, which was so unpleasant and depressing that objections made to it by the prisoners in Riker's Island Penitentiary, for which it was intended, were upheld by the New York City Art Commission and the work discarded. Much discussion was aroused thereby.

The attitude of the public toward painting was manifested in every case where, in the larger exhibitions, popular prizes were awarded by ballot of those in attendance. At the Carnegie International Exhibition in Pittsburgh the popular prize was for the second time voted to a marine painting by Frederick J. Waugh; at the Corcoran Gallery of Art's Biennial Exhibition of Contemporary American Painting it went to a nude, very realistically rendered, by William M. Paxton; and in the special exhibition of "Three Centuries of American Painting" held in the new Museum in Hartford, a paint-

ing by Thomas Eakins entitled "The Pathetic Story" was the popular choice.

As standards for current production have become more hazy and unstable, interest in and appreciation of the works of early American painters seemed to increase. During the summer of 1935 notable exhibitions of portraits by early American painters from Copley to Ashur B. Durand were shown in the Museum of Fine Arts, Boston, and in the Fogg Museum, Cambridge.

Of supreme importance as painting of distinguished merit was the exhibition of portraits by Cecilia Beaux, opened in the American Academy of Arts and Letters, in New York, in November.

A vast amount of new painting was shown in summer exhibitions in New England and elsewhere. Among the most notable of these were those held in Gloucester, Rockport, Provincetown, Ogunquit, Mystic and Old Lyme, Manchester and Stockbridge, Woodstock, and New Hope. A new gallery was opened in Fitz William, New Hampshire.

The summer schools of painting were filled to overflowing and the autumn enrollment at art schools all over the country in 1935 was much larger than ever before. This may be the result of unemployment, but even so it would seem to indicate greatly increased interest in the art of painting.

The American Academy in Rome awarded its Fellowship in Painting to Robert B. Green of Pittsburgh, graduate of the Carnegie Institute of Technology and post graduate of the Yale Art School for a panel in egg tempera picturing "The County Fair."

The Guggenheim Foundation gave Fellowships in 1935 to the following painters: Henry E. Mattson, Yasuo Kuniyoshi, Frank Mechau, and Frederico Le Brun.

The ranks of the painters were seriously depleted in 1935 by the death of the following: Herbert Vos (q.v.), Douglas Volk (q.v.), Edward Percy Moran, Frederick Dielman (q.v.), Childe Hassam (q.v.), Lucile Douglass, Edward C. Volkert, Ambrose E. Webster, Edwin C. Taylor, Jessie Willcox Smith, W. Merritt Post, William Forsyth, Walter Griffen, Walter L. Clark, William de Leftwich Dodge, Oliver Herford, Susan Barse Miller, Mrs. J. Montgomery Sears, Charles Demuth, Peter Marcus, Helen C. Hovenden.

PALAU. See JAPANESE PACIFIC ISLANDS.

PALESTINE. A territory on the east coast of the Mediterranean, administered by Great Britain under a mandate of the League of Nations since Sept. 29, 1923. Capital, Jerusalem.

Area and Population. With an area of about 10,000 square miles, Palestine had an estimated population on Mar. 31, 1935, of 1,245,000. The 1931 census showed 1,035,821 inhabitants, including 759,712 Moslems, 174,610 Jews, 91,398 Christians, and 10,101 of other confessions. On June 30, 1934, the Jewish population was estimated at 307,312. During 1935 61,541 Jews entered the country as immigrants, as against 42,359 in 1934. Estimated populations of the chief cities in 1935 were: Jerusalem, 105,000; Tel-Aviv, 105,000; Haifa, 70,000; Jaffa, 65,000; Nablus, Hebron, and Gaza, about 17,000 each.

Education. In 1933-34 there were 320 Arab public schools, with 30,842 pupils; 174 private Moslem schools, with 10,900 pupils; 467 Jewish schools, with 43,900 pupils; and 148 private Christian schools, with 17,347 pupils. The Hebrew University on Mount Scopus, Jerusalem, had 305 students and 71 teachers in 1934.

Production. A predominantly agricultural

country, Palestine in 1935 produced 103,000 metric tons of wheat, 46,000 tons of durra, 68,000 tons of barley, 69,000 tons of melons, 14,535 tons of tomatoes, and 6500 tons of potatoes. The wine yield in 1933 was 30,000 hectoliters, sesamum 200 tons, olives (1931) 33,900 tons. The production of citrus fruit was rapidly expanding; in 1935 the export crop totaled about 8,000,000 cases, chiefly oranges and grapefruit. Livestock in July, 1934, included 131,000 cattle, 188,000 sheep, 380,000 goats, 15,600 horses, 7000 mules, 4500 buffaloes, 75,000 donkeys, and 32,000 camels. Gypsum, rock salt, cooking salt, carnallite, and bromide are the chief minerals found. The chief industries are the making of wine, soap, food products, cement, and textiles. In 1934 there were 5300 industrial establishments, with about 35,000 workers.

Foreign Trade. Imports for consumption in 1934 were valued at £P15,152,781 (£P11,124,489 in 1933) and exports of Palestine products at £P3,217,562 (£P2,591,617 in 1933). Imports from the United Kingdom in 1934 were £P2,960,706; exports to the United Kingdom, £P1,785,014. United States statistics for 1935 showed imports from Palestine of \$98,269 (\$175,557 in 1934) and exports to Palestine of \$4,941,820 (\$4,394,875 in 1934). Rice, wheat, flour, sugar, wood, cotton piece goods, etc., were the leading imports, while oranges, laundry soap, grapefruit, and wines were the principal exports.

Finance. For the fiscal year ended Mar. 31, 1935, government revenues totaled £P5,452,663 (£P3,985,493 in 1933-34) and expenditures were £P3,230,010 (£P2,704,856 in 1933-34). The surplus of £P2,222,653 in 1934-35 increased the government's reserve fund to £P4,733,555 as of Mar. 31, 1935. The public debt on Mar. 31, 1935, totaled £P4,500,000. The Palestine pound was equivalent in value to the pound sterling.

Communications. Palestine's railway mileage in 1935 was 620 miles, excluding 70 miles on the Ma'an-Mudawara section. In the same year 2,100,095 passengers and 1,022,288 tons of freight were carried. Gross revenues totaled £P785,556 and working expenditures £P481,919. Highways extended 1710 miles. Haifa and Jaffa are the chief ports. In 1934 1684 steamers of 4,264,571 tons entered Palestinian ports. Air lines linked the chief cities with Europe, Egypt, and India.

Government. The Constitution of Sept. 1, 1922, vested executive authority in a High Commissioner and Commander-in-Chief and an executive council. It provided also for a legislative council including representatives of the various religious communities, but due to lack of cooperation among the religious groups this council was not established until Dec. 22, 1935. In the meantime its functions were performed by an advisory council appointed by the High Commissioner. The Jewish, Moslem, and Christian communities enjoyed complete autonomy in their religious, cultural, and communal affairs. English, Arabic, and Hebrew were official languages. High Commissioner and Commander-in-Chief in 1935, Lieut.-Gen. Sir Arthur Grenfell Wachope (appointed Nov. 1, 1931). His term was extended on Dec. 31, 1935, to Nov. 20, 1941.

History. Although Jewish immigration into Palestine continued during 1935 at a greater rate than ever before (see above), there was no repetition of the Arab riots which broke out in 1934 in protest against the Jewish influx (see 1934 YEAR BOOK, p. 541). In five years the Jewish population had doubled and at the end of 1935

it was almost one-half the Arab population. With the balance of population and voting power rapidly shifting in their favor, the more responsible Jewish leaders were anxious to postpone efforts to win League approval of a change in the original mandate under which the Jewish "national home" stipulated in that document would become the Jewish "national state." However the semi-Fascist and militant Revisionist faction of the Zionist movement insisted upon bringing the issue before the Mandates Commission of the League of Nations immediately. The result was a serious setback to the goal of a Jewish state in which the Arabs would be relegated to a subordinate position. The Mandates Commission on Jan. 10, 1935, ruled that the establishment of such a state in Palestine was incompatible with the scope of the British mandate for Palestine. A Revisionist resolution affirming that a Jewish state was the ultimate aim of the Zionist movement was rejected by the World Zionist Congress held at Lucerne, Switzerland, Aug. 20-Sept. 4, 1935. While Zionist sentiment overwhelmingly favored the movement for a Jewish state in Palestine, they felt that open espousal of such an aim would hinder rather than help their cause.

The hope of postponing clarification, and perhaps the crystallization, of Arab-Jewish governmental relationships until the Jewish position was stronger also led Jewish leaders in Palestine to oppose the establishment of the Legislative Council, proclaimed by the British High Commissioner on Dec. 22, 1935 (see under *Government*). The Council was to consist of 28 members, including 14 Arabs (9 elected and 5 nominated), 8 Jews (3 elected and 5 nominated), 5 nominated British officials, and one nominated civilian, representing commercial interests. The chairman would be British. While the Arabs criticized the proposed Council for its lack of power (matters affecting international relations, the mandate, finance, and immigration were reserved to the High Commissioner), they nevertheless indicated that they would modify their former position and participate. The Jews, however, expressed a determination not to cooperate (see *Jews under Palestine*).

The 15-year rule of the intransigent Arab leader, Ragheb Nashashibi, as Mayor of Jerusalem, was ended by his defeat in the municipal elections early in 1935. Dr. Hussein Khalidi, his successor, was an Arab of moderate tendencies favorable to reconciliation of Arabs and Jews. Nashashibi's appeal for annulment of the election was rejected by the High Commissioner. Shortly afterward the former Mayor formed an Arab nationalist party called the Party of National Defence, which was aroused by the success of the Nationalist agitation in Egypt (q.v.) to seek to extract concessions from the British mandatory power, by force if necessary. Another development affecting Jerusalem was the completion late in 1935 of a 38-mile pipeline supplementing a water supply which had been inadequate for the city's needs for more than 2000 years. The new supply raised the amount of water available to 3,000,000 gallons daily instead of the 700,000 gallons available before.

The development of the Anglo-Italian crisis over Ethiopia in September and October, 1935, caused a minor financial panic in Palestine which served to check somewhat the steady development of the economic boom. Business confidence was soon restored, however, and Palestine participated in the economic and financial sanctions imposed against Italy by the League of Nations. Mean-

while the concentration of the British fleet in the Eastern Mediterranean had increased the strategic importance of Haifa, with its newly opened oil pipeline from the Iraqi oil fields. Further development of the port for both commercial and naval purposes was under way at the end of 1935. See ETHIOPIA, GREAT BRITAIN, and ITALY under *History*.

PALESTINE. See ARCHÆOLOGY.

PALMA, ANGELICA. A South American novelist, died Sept. 6, 1935. See SPANISH-AMERICAN LITERATURE under *Peru*.

PANAMA. A republic of Central America, bisected by the Panama Canal Zone (q.v.). Capital, Panamá.

Area and Population. Excluding the Canal Zone, Panama has an area of 28,575 square miles and a population estimated (1934) at 490,991 (467,459 at the 1930 census). The 1930 census showed 78,813 whites, 69,583 Negroes, 42,897 Indians, 4138 Orientals, and 249,583 mestizos. The 1930 population of Panamá City was 74,409; Colón, 29,769.

Education. Primary education is compulsory but about half the population remains illiterate. In 1933-34 there were 51,992 pupils in 500 elementary schools; 3129 students in secondary and vocational schools; and 1718 students in the Instituto Nacional at Panamá. There were also 71 private institutions and various professional and art schools. In accordance with the decree of May 29, 1935, the National University of Panama was inaugurated on Oct. 7, 1935, with the former Instituto Nacional serving as the nucleus for the larger institution.

Production. Agriculture is the principal occupation, the secondary industries being cattle raising, lumbering, and pearl fishing. Shipments of bananas, the chief crop, totaled 4,781,000 stems in 1934; coconuts, 6,097,000 nuts; cacao, 11,640,000 lb.; mother-of-pearl shells, 115,000 lb.; coffee (1933), 138,305 lb. Sugar production was 34,000 metric tons in 1933-34. Rubber, tobacco, potatoes, balata, sarsaparilla, and rice are other products. Cattle herds total about 350,000 and about 40,000 head are slaughtered annually. The forests yield valuable hardwoods. Some gold is mined. Articles manufactured for local consumption include beer, liquors, shoes, tropical clothing, tobacco products, and furniture.

Foreign Trade. General imports in 1934 were valued at 13,448,000 balboas (1 balboa equals 1 dollar), against 9,296,000 balboas in 1933, while exports of Panama products amounted to 3,407,000 balboas (2,559,000 in 1933). The chief exports, in 1000 balboas, for 1934 were: Bananas, 2044; cacao, 679; coconuts, 135. Textiles, petroleum products, perfumery, wheat flour, and meats were leading imports. The United States in 1934 supplied 53.4 per cent of the imports (57.2 in 1933); Japan, 12.6 (7.4); United Kingdom, 7.1 (8.2). The United States purchased 91.8 per cent of the exports in 1934 (89.5 in 1933).

Imports in 1935 totaled 15,945,779 balboas; exports, 3,992,654 balboas (preliminary). United States statistics for 1935 showed imports from Panama of \$5,113,741 (\$4,186,732 in 1934) and exports to Panama of \$20,816,698 (\$18,335,512).

Finance. Government revenues and expenditures in the period from Jan. 1, 1933, to Dec. 31, 1934, were 15,653,677 balboas and 14,802,317 balboas, respectively. Budget estimates covering the two years ending Dec. 31, 1936, balanced at 12,614,000 balboas. In addition there were special budgets covering the charity and anti-tuberculosis fund and road fund operations, with estimates balancing at

1,880,000 and 825,000 balboas, respectively. The direct public debt on June 30, 1934, totaled 19,062,896 balboas (external, 15,913,646; internal, 3,156,250) and the indirect debt was 1,915,207 balboas.

Communications. The Panama Railroad connecting Panamá on the Pacific with Colón on the Atlantic is the chief railway line (47.61 miles). Including the Panama Canal Zone lines and several narrow-gauge lines in Chiriqui Province, there were 230 miles of railway lines in 1934. Highways extended about 680 miles in 1934. In furtherance of the Pan American Highway project, the U.S. Government in 1935 agreed to construct a 600-ft. bridge over the Chiriqui River in Panama. Air lines connect the larger cities and towns with the inter-American air network. The merchant marine in 1934 comprised 72 vessels of 271,509 gross tons.

Government. The Constitution of Feb. 13, 1904, as amended in 1918 and 1928, vested executive power in a President elected by direct vote for four years and ineligible for reelection. Legislative power rests in a national assembly of 32 members, elected for four years. President in 1935, Dr. Harmodio Arias (assumed office, Oct. 1, 1932).

History. The negotiations for a revision of the United States-Panama Treaty of 1903, by which the United States obtained a perpetual lease of the Panama Canal Zone and established a protectorate over Panama, continued with several interruptions throughout 1935. Inaugurated in Washington in 1934 by a special envoy of the Panamanian Government, the negotiations received a new impetus from conversations held between Presidents Arias and Roosevelt during the latter's visit to Panama on Oct. 16, 1935. In a New Year's message published in the *New York Times* of Jan. 1, 1936, Secretary of State Hull said the negotiations with Panama were "now at a stage where there is an excellent prospect of an agreement satisfactory to both countries being signed in the near future."

The principal issues on which agreement proved most difficult were the form of payment of the Canal Zone annuities to the Panamanian Government by the United States; jurisdiction over the suburb of New Cristobal in Colón, which was constructed by the government of the Canal Zone for its employees; the control of radio broadcasting facilities in the Canal Zone; sales of government stores in the Canal Zone in competition with Panamanian merchants; and the development and control of the Pan American Highway in the Canal Zone region.

The annuities controversy arose in 1934 when the Washington Government paid the \$250,000 annual rental for the Canal Zone in checks redeemable in paper dollars, in place of the gold coin called for in the 1903 treaty. Panama refused to accept the checks and in March, 1935, threatened to discontinue service of the \$4,500,000 loan of 1923 unless the annuities were paid in gold or the equivalent in depreciated currency. (The Government of Panama and its subdivisions were already in default as to interest payments on \$14,453,000 out of the \$18,727,500 in dollar bonds outstanding as of Dec. 31, 1934.) It was announced on November 20 that a settlement of the annuities question had been reached, conditional upon a mutual agreement on the other issues under discussion.

Another dispute which arose during the year involved the request of the Panamanian Government for permission to construct a transisthmian highway connecting the city of Colón with the city of Panamá on the Pacific side of the Isthmus. To

construct such a highway, Panama had first to secure a waiver by the Panama Railroad (owned by the Canal Zone Government) of its exclusive monopoly of all forms of communication between the two oceans.

The growing nationalistic feeling in Panama was reflected in legislation placed in effect during 1935. One law, designed to restore control of the retail trade to Panamanian citizens, limited foreign retail shops to one for each 100 persons of the same nationality residing in the republic. The cities of Panamá, Colón, and Bocas del Toro were exempted from the law's application. When the law became effective July 1, 1935, some 350 Chinese and East Indian shopkeepers in towns in the interior were classified as surplus and taxed an additional \$30 per month. After Jan. 1, 1936, the tax was to be increased gradually until it reached \$75 a month. In September the Civil Court of Appeals declared the legislation unconstitutional. Its final determination was pending before the Supreme Court at the close of the year.

Another law, intended to provide additional employment for Panamanian nationals, required that three-fourths of the employees of all business concerns operating in Panama should be citizens of the republic. This law aroused especially vigorous opposition among the numerous East Indian shopkeepers who monopolized much of the tourist trade. The so-called "free trade law," which became effective Mar. 1, 1935, was considered the most important economic measure adopted since Panama became independent. Import duties on practically all commodities except a few advantageously produced in Panama were removed, effective June 1, 1935, for the purpose of fostering Panama's tourist and reexport trade and making it a distributing centre for the commerce passing through the Panama Canal. The law also made provision for the development of a deep-water port at Chame Bay, with eventual establishment of a free port in view. The government also purchased about 250,000 acres of farm land for redistribution among landless families and promoted the cultivation of rice, sugar cane, and other tropical crops.

The campaign for the presidential election of 1936 got under way in earnest in September, 1935, following the discovery of a plot to overthrow the Arias administration. On August 30 elements opposing the government obtained a number of machine guns, automatic rifles, small arms, and ammunition from a United States army post in the Canal Zone for the purpose of starting a revolution. In connection with the plot, the police arrested Francisco Arias Paredes, leader of the Liberal Reform party and a presidential candidate at the 1932 elections; a member of the National Assembly; and a former chief of the Panama police. The nomination of Domingo Diaz Arosemena for the presidency by the dominant Doctrinary Liberals caused the secession from the party of a faction known as the Liberal Democratic party, who on September 22 nominated Enrique A. Jimenez, former Secretary of Finance, as their candidate. On November 10 Dr. Belisario Porras, four times President of the republic, was nominated by the Liberal Union party and on December 22 the Revolutionary Coalition party, affiliated with the Arias administration, nominated Dr. J. D. Arosemena, Minister of Foreign Relations, despite the action of the national election jury in declaring him ineligible. See PANAMA CANAL ZONE.

PANAMA CANAL. According to the annual report of the Governor of the Panama Canal for the

fiscal year ending June 30, 1935, transits of ocean-going commercial vessels in 1935 numbered 5180 as compared with 5234 transits in the previous year, a decline of 54, or 1.1 per cent. For the year, transits through the Canal averaged 14.19 per day as compared with 14.34 in 1934, 11.40 in 1933, 11.92 in 1932, 14.71 in 1931, 16.51 in 1930, and 17.23 in 1929, when traffic through the Canal attained its peak. In comparison with the previous year, there also was a decline of 2.6 per cent in Panama Canal net tonnage and 3.1 per cent in tolls. On the other hand, the volume of cargo carried through the Canal was higher, showing an increase of 2.5 per cent as compared with the preceding year.

The method of classifying ships passing through the Canal was changed during the year, and all previous traffic summaries have been revised to show statistics on the basis of the revised classification. Traffic is now segregated into three classes, namely, (1) ocean-going commercial traffic, which includes all tolls-paying vessels of 300 or more net tons, Panama Canal measurement, or 500 or more tons, displacement measurement; (2) local commercial traffic, which includes all tolls-paying vessels of less than 300 net tons, Panama Canal measurement, and also all tolls-paying naval vessels under 500 tons displacement measurement; and (3) vessels transiting the Canal free of tolls. The last named classification includes all naval and other vessels owned and operated in the Government service of the United States and Panama, war vessels of Colombia, and vessels transiting the Canal solely for repairs at the Balboa shops.

Previously, the tolls-paying vessels were classified by commercial ships of 20 net tons or over, and launches under 20 net tons. The new classification was devised with a view to giving better comparative statistics covering the transit of normal-sized commercial vessels, primarily with a view to preventing these statistics from being distorted by frequent transits of small toll-paying vessels engaged in local trade between the two coasts of Central America.

The history of Canal traffic has reflected five distinct trends in the world's economic and commercial developments. After the opening of the Canal on Aug. 15, 1914, there was a slow growth through eight years, in which the maximum of transits was 2791 in 1921. The rise in Californian oil production was primarily responsible for raising the transits to 3908 in 1923 and 5158 in 1924. Traffic continued at about this level until the business expansion brought a considerably increased volume toward the end of the last decade when Canal traffic reached peaks of 6289 in transits, \$27,111,125 in tolls, 30,647,768 in cargo tonnage, and 29,963,670 in net tonnage, Panama Canal measurement. From these peaks the world-wide depression resulted in a sharp curtailment of traffic, the low point being reached in 1933 when transits dropped to 4162, tolls to \$19,601,077, cargo tonnage to 18,161,165, and net tonnage, Panama Canal measurement, to 22,803,798. Beginning in August, 1932, a gradual increase in Canal traffic began, coincident with the general improvement in economic conditions, and total traffic for the fiscal year 1933 nearly equaled that of the previous year.

During the fiscal year 1934 the improvement continued uninterruptedly until March when four successive declines occurred at the close of the fiscal year. In June, 1934, the decline was particularly marked, due principally to strikes on the west coast of the United States which tied up shipping. Beginning in July, 1934, and continuing until November, each month's traffic through the Canal

again showed an increase over the preceding month. Thereafter, traffic declined steadily until the end of the fiscal year. A marked decrease in shipments of mineral oils from California was partly responsible for this decline. In June, 1935, traffic through the Canal reached its lowest point since August, 1934; the decrease being attributed in part to seasonal factors and in part to labor troubles on the west coast of the United States.

In the fiscal year 1935 the transits of naval and other public vessels of the United States Government, public vessels of the Colombian Government, and vessels transiting solely for repairs, none of which pay tolls, numbered 552, as compared with 503 for 1934. The total of tolls-paying and free transits combined, which includes all ocean-going vessels of 300 tons or more, numbered 5732, in comparison with 5737 in 1934, making daily averages of 15.70 and 15.72, respectively.

Net tonnage of the ocean-going commercial vessels passing through the Canal in 1935 aggregated 27,805,588 tons, Panama Canal measurement, a decrease of 2.6 per cent in comparison with 1934. Tolls in 1935 amounted to \$23,307,062, decreasing 3.1 per cent in comparison with the \$24,047,183 collected in the preceding year.

Cargo carried through the Canal in 1935 amounted to 25,309,527 tons and was 2.5 per cent higher than cargo in 1934. This increase was due wholly to gains in the tonnage moving from the Atlantic to the Pacific, cargo tonnage in that direction registering an increase of 22.2 per cent in comparison with the preceding year. From the Pacific to the Atlantic there occurred a loss in cargo tonnage, the movement in this direction decreasing 4.1 per cent.

Segregating the traffic through the Canal by nationality of vessels, the accompanying table shows the aggregate cargo carried by ships of the leading maritime nations during each of the past three fiscal years. For the year 1935, the number of transits of each nationality is also shown.

Nationality	1933 * Tons	1934 * Tons	1935 * Tons Transits	
United States	7,987,739	11,578,453	10,825,573	2,143
British	4,170,995	5,193,136	5,776,021	1,170
Norwegian	1,773,161	2,080,833	2,463,675	515
Japanese	1,159,733	1,510,916	1,446,049	255
German	813,231	962,218	1,300,991	341
Swedish	403,169	766,921	782,548	111
French	249,395	430,471	570,034	116
Danish	448,863	533,262	555,981	125
Danzig	347,934	575,125	440,186	49
Netherlands	381,071	403,451	439,168	114
Italian	189,371	256,465	336,196	77
All remaining	236,503	412,758	373,105	164
Total	18,161,165	24,704,009	25,309,527	5,180

* Fiscal year ended June 30.

PANAMA CANAL ZONE. A strip of land extending for five miles on each side of the Panama Canal, the use of which was granted to the United States in perpetuity by the Panama-United States treaty of 1903. Area, 552.8 square miles (land area, 361.86 sq. miles). The civil population in June, 1935, totaled 29,636 (29,964 in June, 1934). Of the 1935 total, 7553 were employed by the Panama Canal and the Panama Railroad, including 2587 Americans and 4966 aliens. About 500 Americans and 4200 alien employees were living outside of the Canal Zone. The birth rate, including still-born, of the Canal Zone population in 1934 was 11.48 per 1000 population; death rate, 6.43, or the lowest on record. The Canal Zone in 1934-35 maintained 6 elementary and 5 secondary schools for white children, with an average attendance of 2797;

and 8 elementary and 1 normal school for colored children, with an average attendance of 3406.

The net revenues from Canal operations proper were \$14,519,506 for the fiscal year ended June 30, 1935 (\$16,810,348 in 1933-34). Net revenues from business operations under the Panama Canal were \$1,021,217 (\$1,366,755 in 1933-34). The combined net revenues accruing from the Canal and its business units totaled \$15,540,723 (\$18,177,103 in 1933-34). The capital investment at the beginning of the fiscal year was \$543,744,707 and the net revenue represented a return of 2.86 per cent on the investment (3.37 per cent in 1933-34). The foregoing figures exclude operations of the Panama Railroad Co. which showed a net profit of \$899,196 (\$1,156,738 in 1933-34). For Canal transits and tolls in 1934-35, see PANAMA CANAL.

The status of the Canal Zone is that of a military reservation under a Governor appointed by the President of the United States. The Canal Administration controls sanitation and quarantine in the cities and harbors of Panamá and Colón, although they remain within the political jurisdiction of Panama. The U. S. Army maintains airports at France Field, at the Atlantic entrance to the Canal, and at Albrook Field on the Pacific side. Governor in 1935, Col. Julian L. Schley, U. S. Army.

History. On Aug. 30, 1935, a number of machine guns, automatic rifles, small arms, and ammunition were stolen from the U. S. Army ordnance depot at Corozal for use in overthrowing the administration of President Arias in the Republic of Panama (see PANAMA under History). Canal Zone authorities arrested Ellis M. Stevens and Edward Payne, both former American soldiers, in connection with the theft after the Panamanian police had uncovered the plot. On October 30 Stevens was sentenced to seven and one-half years in prison and Payne to three and one-half years.

Nelson Rounsevell, publisher of *The Panama American*, was fined \$500 or 90 days in jail by Judge Richard Thomas at Balboa on October 4 after a Canal Zone jury had convicted him of criminally libeling Maj. Gen. Harold B. Fiske in an editorial attacking alleged unbearable conditions for enlisted men at Fort Clayton in the Canal Zone. The defense offered testimony indicating that the smoking of marijuana on post by soldiers was common.

PAN AMERICAN UNION, THE. An official international organization, founded in 1890 as the International Bureau of American Republics and maintained by the 21 republics of the western hemisphere for the development among them of good understanding, friendly intercourse, commerce, and peace. It is controlled by a Governing Board, composed of the Secretary of State of the United States and the diplomatic representatives at Washington of the other republics, and is administered by a Director General and an Assistant Director chosen by the Board.

The Pan American Union publishes a monthly *Bulletin* which is issued in three editions, English, Spanish, and Portuguese, as well as numerous special reports on the countries members of the Union. These are widely distributed in all the republics of the American continent and are intended to make available information on the various aspects of inter-American activity.

The Union also acts as the permanent organ of the International Conferences of American States which meet at intervals of five years. The programme and regulations of each conference are

prepared by the Governing Board of the Union, and in the interval between the conferences the Union is engaged in giving effect to the resolutions adopted and also coöperates in securing the ratification of the treaties and conventions signed at each conference.

During the year 1935 the Pan American Union was actively engaged in giving effect to the conclusions adopted at the Seventh International Conference of American States, which met at Montevideo, Uruguay, from Dec. 3 to 26, 1933. At that conference, 95 resolutions were approved, and 6 conventions and 1 protocol were signed by the delegates of the American Republics.

The conventions signed at the Montevideo Conference were as follows:

1. Convention on the Rights and Duties of States
2. Convention on Nationality
3. Convention on the Nationality of Women
4. Convention on Asylum
5. Convention on Extradition
6. Convention on the Teaching of History
7. Additional protocol to the Inter-American Conciliation Convention

In addition to the foregoing conventions, there was also signed at Montevideo at the time of the Conference, a treaty on Equal Civil and Political Rights by representatives of Cuba, Ecuador, Paraguay, and Uruguay.

Among the important resolutions adopted at the Montevideo Conference was one providing for the future codification of international law. In its broad outlines the resolution provides for the maintenance of the International Commission of Jurists created by the Rio Conference of 1906, to be composed of jurists named by each government; for the creation by each government of a National Commission of Codification of International Law, and for the creation of a Commission of Experts of seven jurists charged with the duty of organizing and preparing the work of codification. The Pan American Union has received from the member governments the names of the candidates from which the commission of seven experts shall be selected, and has forwarded the complete list to the governments in order that they may indicate their choice for membership on the committee.

Another important resolution adopted at Montevideo was a recommendation for the adoption of a pact referring to multi-lateral commercial treaties which should include stipulations by which countries should be obliged not to invoke the unconditional most-favored-nation clause in bilateral treaties, without assuming the corresponding obligations. Such an agreement was drawn up by the Pan American Union and has been signed by the following governments: United States, Panama, Cuba, Nicaragua, Belgium, Guatemala, Greece, and Colombia.

In addition to the International Conferences of American States which meet every five years, a series of special or technical conferences is held in the interval between the International Conferences for the purpose of considering specialized subjects. During the year 1935 the following special Pan American conferences were held:

1. Pan American Commercial Conference, Buenos Aires, May 26-June 19, 1935.

This Conference was convened by the Argentine Government pursuant to a resolution of the Seventh International Conference of American States, and adopted a series of resolutions and signed a number of conventions having for their object the development of closer commercial relations between the republics of the American Continent.

2. Seventh American Scientific Congress, Mexico City, Sept. 9-16, 1935.

3. Third Pan American Red Cross Conference, Rio de Janeiro, Sept. 15-25, 1935.

4. Seventh Pan American Child Congress, Mexico City, Oct. 12-19, 1935.

5. Second General Assembly of the Pan American Institute of Geography and History—Washington, D. C., Oct. 14-19, 1935.

6. Labor Conference of the American States, Members of the International Labor Organization. Scheduled to meet at Santiago, Chile, on Dec. 30, 1935.

Among the other major events of an inter-American character during the year 1935 was the ratification by the Colombian Congress of the Leticia Protocol signed by the representatives of Colombia and Peru in Rio de Janeiro on May 24, 1934. The protocol had been ratified previously by the government of Peru and contains a basis for the settlement of the controversy between the two countries growing out of the Leticia incident of September, 1932. See **COLOMBIA** and **PERU** under *History*.

On June 12, 1935, there was also signed at Buenos Aires an agreement looking toward the settlement of the Chaco controversy between Bolivia and Paraguay. The agreement was negotiated through the good offices of the neutral powers meeting at Buenos Aires at the invitation of the Minister of Foreign Affairs of Argentina, Dr. Carlos Saavedra Lamas. See **BOLIVIA** under *History*.

Pan American Day was observed on April 14 in all the countries members of the Pan American Union. This day has been set aside by presidential proclamation in all the countries of the American Continent, pursuant to a recommendation of the Governing Board of the Pan American Union. The purpose of the Day is to commemorate the community of interest of the republics of the American Continent, and it is observed by colleges and universities, elementary schools, clubs, and other groups interested in international affairs.

At the meeting of the Governing Board of the Pan American Union held on November 6, Cordell Hull, Secretary of State of the United States, was reelected Chairman of the Board for the ensuing year. At the same time Felipe A. Espil, Ambassador of Argentina, was elected Vice Chairman to succeed Manuel de Freyre y Santander, Ambassador of Peru. Headquarters are at the Pan American Union Building, Washington, D. C.; L. S. Rowe, Director General; E. Gil Borges, Assistant Director.

PAN-PACIFIC UNION. THE An organization founded in 1907 for the purpose of bettering relations among Pacific peoples, chiefly through the calling of frequent conferences in all lines of thought and action in the Pacific area. It has been supported in part by appropriations from the governments of the Pacific—the United States, Canada, Australia, New Zealand, Japan, China, Siam, the Netherland East Indies, French Indo-China, and Mexico. It is now urged that these governments take over the machinery of the Pan-Pacific Union, financing it as their official mouthpiece, and that the Union's honorary heads, the presidents, premiers, and governors of Pacific lands, gather periodically in Honolulu for a friendly conference on Pacific affairs.

During 1934 the director of the Union, Alexander Hume Ford, continued his travels in China, Japan, and the Philippines, organizing student and adult Pan-Pacific clubs which function as open forums for the peoples themselves. The official organ of the Union is the *Mid-Pacific Magazine*. Walter F. Frear, a former governor of Hawaii, is president. The central executive office is in Honolulu, at 1067 Alakea St.

PAPER AND PULP. The capacity of the entire paper-making industry in the United States is placed at 13,898,850 tons of paper per year on the basis of 1935 equipment. On this basis, accord-

ing to the estimates of *The Paper Trade Journal*, the production reached 74 per cent of the total capacity, with an output of 10,307,000 tons. This is the highest output since 1929 and is within 8 per cent of the peak production of 11,140,235 tons in that year. The estimate places the output of 1935 at 1,120,400 tons in excess of that of 1934. By grades, the estimated production of 1935 in the United States in comparison with the actual production in the years 1929 and 1934 is shown in the accompanying table.

Grade	1929	1934	1935
Writing paper	607,590	417,859	480,500
Cover paper	28,072	17,011	20,500
Book paper	1,497,912	1,055,247	1,194,000
Wrapping paper	1,605,783	1,356,115	1,570,000
Newsprint	1,409,169	989,705	939,000
Paperboard	4,451,187	4,073,261	4,693,000
Tissue paper	387,811	397,196	425,000
Building paper	659,178	327,866	426,000
All other paper	493,533	552,338	559,000
Total	11,140,235	9,186,598	10,307,000

In Canada, according to the same authority, the paper mills produced 3,069,516 tons of paper in 1935 as compared with 2,419,420 tons in 1934.

The combined production in 1935 of all grades of pulp in the United States, as given by *The Paper Trade Journal*, was 4,895,000 tons, as compared with 4,490,859 in 1934. Canadian production was estimated at 3,681,000 tons as against 3,566,914 tons in 1934.

PAPUA, pāp'u-a; pā'pōō-ā, TERRITORY OF. A Territory of Australia, consisting of the south-eastern area of the island of New Guinea (87,786 sq. m.) and the Woodlark, D'Entrecasteaux, Louisiade, and Trobriand groups of islands (2754 sq. m.). Total area, 90,540 sq. m.; total population (June 30, 1934), 276,107 including 1107 Europeans and 275,000 natives (estimated). Capital, Port Moresby.

Production and Trade. The main agricultural products were coconuts, and rubber. Sisal hemp, coffee, kapok, Mauritius beans were other crops. Gold (19,497 oz. exported in 1933-34), silver, osmiridium, and copper were the principal minerals. For 1933-34, imports were valued at £220,227; exports, £249,135 including gold (£45,933), rubber (£61,324), copra (£42,990), and desiccated coconut (£48,000). The ocean shipping that entered and cleared during 1933-34 aggregated 373,895 tons. In 1934-35, imports totaled £269,299; exports, £294,743.

Government. Revenue for the year ended June 30, 1934, inclusive of a subsidy of £40,000 from Australia, totaled £121,147; expenditure was £121,199. A lieutenant-governor, aided by an executive council and a legislative council, administers the Territory. Lieutenant-Governor in 1935, Sir J. H. P. Murray. See **EXPLORATION**.

PARAGUAY, pā'r-ā-gwā. An inland republic of South America. Capital, Asunción.

Area and Population. The area of Paraguay proper, lying east of the Paraguay River, is estimated at 61,647 square miles. Ownership of the Chaco Boreal on the west bank of the Paraguay, with an area of about 100,000 square miles, is in dispute between Bolivia and Paraguay. On Dec. 31, 1933, the estimated population of Paraguay was 900,000, including 67,500 in the Chaco Boreal, and that of Asunción was 94,456. Other towns, with their estimated 1933 populations, are: Villarrica, 35,260; Carapeguá, 17,130; Luque, 15,967. The people are mainly of mixed Spanish and Guarani Indian blood, with a small white ruling class. Spanish

and Guaraní are the spoken languages; Spanish, the official language.

Education. Illiteracy is widespread, and the educational system was being reorganized in 1935 in an effort to improve educational standards. Educational facilities in 1934 consisted of 1630 public and private elementary schools, with 104,994 pupils; 9 secondary schools, with 2111 pupils; and the National University at Asunción with 528 students.

Production. The people are engaged mainly in agriculture, stock raising, and lumbering. Yerba maté (native tea), tobacco, cotton, sugar, corn, rice, beans, oranges, mandioca, sweet potatoes, and ground-nuts are the principal crops. The 1933-34 cotton crop was 30,000 metric tons (unginned). The 1934-35 tobacco crop was estimated at 40,000 to 50,000 bales (of 220 lb. each), against about 10,000 bales in 1933-34. Sugar production in 1934 was about 3500 metric tons. Cattle in 1933 numbered about 3,243,900; horses, 295,000; sheep, 202,544; swine, 48,626. The cattle herds were greatly reduced by government requisitions and drought in 1934. The quebracho trees of the Chaco yield an extract widely used in tanning, of which the 1934 production totaled about 48,000 metric tons. Deposits of iron, manganese, and copper remain largely undeveloped. The chief manufactures are tinned meat, animal by-products, quebracho extract, beverages, and shoes.

Foreign Trade. Imports in 1934 were valued at 11,340,000 gold pesos (7,159,691 in 1933) and exports at 12,372,000 gold pesos (9,767,520 in 1933). A considerable portion of the goods entering Paraguayan trade are reshipped at Buenos Aires. In 1933 animal products accounted for 3,631,020 gold pesos of the total exports; forest products, 3,573,999 gold pesos; agricultural products, 2,489,231 gold pesos. Cotton textiles, foodstuffs, vehicles, and boats are the principal imports.

Finance. Exclusive of war and national defense expenditures, the budget estimates for the fiscal year ended Aug. 31, 1934, placed receipts at 5,704,080 gold pesos and expenditures at 3,062,337 gold pesos. The actual budgetary situation had not been made public since the outbreak of the war with Bolivia in 1932.

The public debt on Nov. 30, 1933, was reported at 8,456,304 gold pesos (external, 3,345,742; consolidated internal, 3,381,477; floating, 1,729,085). The gold peso exchanged at an average of about \$0.67 in 1934, \$0.7280 in 1933, and \$0.5844 in 1932.

Communications. Asunción, situated 950 miles up the Paraná-Paraguay rivers, is accessible to vessels of 12-foot draft. In 1933 3495 vessels of 363,733 tons entered the port of Asunción and 4008 of 411,569 tons cleared. The railway mileage in 1934 was 669, including 232 miles of the Paraguay Central Railway linking Paraguay with the Argentine railway network. Several logging railways run westward from the Paraguay River into the Chaco Boreal. Motor bus lines connect some of the principal towns but the country roads are for the most part passable only to bullock carts.

Government. The Constitution of 1870 vested executive power in a President, elected for four years, and legislative power in a Congress of two houses—the Senate of 20 members elected for six years (one-third every two years) and the Chamber of Deputies, of 40 members, elected for four years (one-half every two years). President in 1934, Dr. Eusebio Ayala (Liberal), who assumed office Aug. 15, 1932.

History. The end of the Chaco War on June 14, 1935, found Paraguay in possession of a large part

of the territory in dispute with Bolivia (see BOLIVIA under *History* for a description of the military developments and peace negotiations). Although unexpectedly successful in the military struggle, Paraguay apparently suffered far more than her larger and wealthier opponent in an economic and financial way. The financial strain resulted in drastic inflation of the currency and a resultant rapid rise in prices which caused much suffering and economic dislocations. The Paraguayan peso was purchasable at 300 to the dollar in September, 1935. The government had requisitioned all official foreign exchange for the purchase of munitions and war supplies. Payments on foreign debts were defaulted. A moratorium, declared on commercial debts, was extended to May 31, 1936. Salaries of public employees were months in arrears and foreign business with Paraguay was transacted on a strictly cash basis. In order to augment its income, the government in April introduced legislation in Congress for the establishment of an Administration of Industrial Control and of State Monopolies. The state monopolies were to include gasoline, alcohol and alcoholic beverages, and beverages distilled from sugar cane. On Aug. 17, 1935, the official exchange rate was changed from 1875 Paraguayan pesos to one Argentine peso to 25 to one, respectively.

President Ayala dealt with these pressing economic and social problems in his message to Congress of Apr. 1, 1935. He urged that instead of resorting to foreign loans the government should take the lead in a "rational organization of the domestic security market." He requested an appropriation for expert aid in establishing a modern system of accountancy and of financial supervision over treasury operations. With Paraguay's manpower depleted by the Chaco War, the government took steps toward the provision of land and homes for the relatively large class of landless, migratory agricultural laborers. It also attempted to encourage the immigration of foreigners and especially of experienced farmers. It was reported in May that the Dukhobors of western Canada, after long conflict with governmental authorities there, had arranged to purchase a large tract of land in the Chaco Boreal for the establishment of a colony. A Mennonite settlement, established in the Chaco Boreal in 1927, was reported to have prospered. It supported a population of 6000 in 1934.

On Nov. 10, 1935, the Paraguayan Foreign Office formally protested the alleged illegal occupation by Argentina of a strip of territory 15 to 25 miles wide and 125 miles long along the southern border of the Chaco Boreal. The Argentine-Paraguayan frontier in the Chaco was fixed in 1878 by the arbitral decision of President Hayes of the United States, who ruled that it followed the main arm of the Pilcomayo River. An Argentine-Paraguayan commission found that the southern branch was the main arm. In 1934, however, the main channel was reported to have shifted from the southern to the northern branch. Argentine troops then advanced the boundary to the northern arm of the Pilcomayo. Paraguayan sources charged that the main stream of the river was diverted to the northern branch by Argentine military engineers. The territory involved, however, had little economic importance.

PARK COLLEGE. A nonsectarian institution for the higher education of men and women at Parkville, Mo., founded in 1875 and cooperating with the Presbyterian Church in the United States of America. The enrollment for 1935-36 totaled 506;

faculty numbered 36. Endowment funds totaled \$1,730,000, from which the income was \$71,125. Tuition and fees amounted to \$108,000 and donations to \$42,600. The library contained 27,311 volumes. A new addition to the gymnasium and a new chemistry laboratory were erected during the year. President, Frederick W. Hawley, D.D., LL.D.

PARKS, NATIONAL. On the basis of the fiscal year, July 1, 1934, to June 30, 1935, in his annual report to the Secretary of the Interior, the Director of the National Park Service, Arno B. Cammerer, stated that visitors increased 22 per cent over the preceding year, which up to that time had been the banner year of national park history. Reported visitors to national parks, monuments, and other areas of the system amounted to 6,337,206. This figure does not show the total travel.

Continuation of the Emergency Conservation Work programme allowed the Service to benefit to a still greater degree in conservation activities for protection of the parks, and provided material expansion in the programme for state, county, and metropolitan parks. Records show an increase in state parks of 67,300 acres of land during the seven months from Sept. 1, 1934, to Apr. 1, 1935, and this area has been added to since. These additions were in 25 of the 48 States.

Legislation extending the Emergency Conservation Work for a 2-year period made possible an allotment of 600 CCC camps to the National Park Service for the period Apr. 1 to Sept. 30, 1935, with 118 camps in national parks and monuments and 482 in state park areas. This activity has been extended to the Hawaiian Islands and the Virgin Islands. In all approximately 150,000 young men have been engaged in this work.

When the National Ski Association last December selected Mount Rainier National Park for its national championship ski races, it focused definite attention on the opportunities for winter sports in the mountainous national parks which enjoy mild climates and are easily accessible. The meet attracted 7000 visitors. Mount Rainier also was the scene of tryouts for contestants to represent the United States in the next Olympic games. Yosemite National Park was another important centre in winter sports, as many as 500 people in one day using the ski fields. There were similar activities in other parks. Of the 24 national parks, 18 now remain open the year around. Winter is the ideal season for visits to Death Valley.

A number of scientific discoveries were made during the year in national park areas. Although scientists had believed no fossil finds would be made in Death Valley, a park employee discovered there practically the entire skull of a titanothere, a prehistoric animal of the rhinoceros tribe. Later another skull of the same type was unearthed. There has been only one other discovery of fossil bones of this animal west of the Rocky Mountains, and the skulls discovered were the first. Dinosaur tracks were uncovered by CCC workers in Zion National Park, and a 50-foot dinosaur skeleton was found a mile from the Colorado National monument boundary.

The National Park Service continued to be active in the protection of wild life. Among projects completed with this end in view were the construction of small reservoirs and the conservation of spring water in the arid southwest areas, boundary fencing to protect game ranges, construction of fenced quadrates to facilitate range studies, installation of bear-proof devices, and erection of storm and feed shelters for birds in eastern areas.

Due to the activity of the Interior Department and the National Park Service, the trumpeter swan, the largest American water-fowl, appears to have been saved from extinction.

The addition to the system of the Dry Tortugas Islands, to be known as Fort Jefferson National Monument, will contribute to the conservation of bird life. The sooty and noddy terns are not known to nest elsewhere in the United States.

Fire prevention and forest protection were carried on very largely during the fiscal year under Public Works and Emergency Conservation Work appropriations and the reports of those agencies detail the greater part of this activity. A very creditable fire record, despite the previous dry summer, was made. The presence of the ECW camps was of immense assistance as a protective measure.

Changes in the status of park and monument lands were mainly in the direction of new acreage for existing members of the system. No new parks were created and but one national monument. There are now 24 national parks, 1 national historical park, 68 national monuments, 11 national military parks, 10 battlefield sites, 4 miscellaneous memorials, and 11 national cemeteries, comprising a total acreage of 15,249,333, exclusive of the National Capital parks, which include 683 reservations covering 6775 acres, which are administered as a separate unit.

PASADENA TUNNEL. See TUNNELS.

PATHOLOGY. See BOTANY.

PAYNE, JOHN BARTON. An American lawyer and chairman of the American Red Cross, died in Washington, D. C., January 24. Born at Pruntytown, Va. (now in W. Va.), Jan. 26, 1855, he was educated in the schools of Farquier Co., Va., going to work in a store at the age of 15. Later he was employed by the clerk of a neighboring town, during which time he devoted himself to the study of law, and was admitted to the bar in 1876, beginning to practice at Kingwood, W. Va., where he remained until 1882. He became actively interested in Democratic politics, serving as chairman of the Preston County Democratic committee from 1877 to 1882, and being sent as a delegate to state and congressional conventions.

In 1882, desiring a wider field for his activities, he moved to Chicago, where his talents as a lawyer soon won him recognition. He was counsel in many important cases, and was successful in defending the 14 Chicago packers indicted under the Sherman Act, and the American Car Co., the dissolution of which was sought for alleged violations of that Act. He was elected president of the Chicago Law Institute in 1889, and four years later became judge of the Superior Court of Cook County, being the only successful Democratic candidate. In 1898 he resigned from the bench and resumed the practice of law, retiring on Jan. 1, 1918. From 1911 to 1926 he served on the board of South Park Commissioners, Chicago.

In 1917, Judge Payne was appointed counsel to the U.S. Shipping Board Emergency Fleet Corporation by President Wilson, and in the following year also general counsel of the U.S. Railroad Administration. In this latter position he supervised all the legal work connected with the Government's control of the railroads, preparing the contracts, settling claims, protecting property, and handling the negotiations relating to the compensation due the railroads used by the Government. He held these positions until 1919 when he was appointed chairman of the U.S. Shipping Board. In 1920, the

President appointed him Secretary of the Interior, and he held this office until Mar. 4, 1921. During his administration of the Department of the Interior, he devoted considerable effort to the conservation of petroleum and of the national parks, and put into effect the Oil Leasing Act. Also, he served as director general of railroads from May, 1920, to April, 1921.

In 1921, President Warren G. Harding offered him the chairmanship of the American Red Cross which he accepted on the condition that no salary be paid to him. It was under his leadership that all the Red Cross organizations in the Americas were incorporated under one charter. Under his direction the Red Cross rendered aid in the famine of the early 1920's in the Near East; sent supplies to the value of \$11,750,000 to Japan in the earthquake of 1923; aided about 40,000 persons at a cost of nearly \$4,500,000 during the Florida hurricane of 1926; extended aid to 637,000 sufferers at a cost of \$17,000,000 during the Mississippi floods of 1927. The last was considered the greatest relief project in time of peace on record. Relief was extended also to the stricken peoples of the West in the drought of 1930-31.

In 1922 Judge Payne was elected president of the League of Red Cross Societies, organized after the World War by representatives of Great Britain, France, Italy, Japan, and the United States. He held this office until his death. In 1923, he served as a U.S. Commissioner to negotiate recognition of Mexico.

Because of his tireless devotion to the work of the Red Cross, he was honored by almost every country and had received Red Cross medals from 17 nations.

PEACE. British Peace Ballot, THE. The final results of the British peace ballot were made public on June 27. Nearly 12,000,000 votes were cast representing more than 37.9 per cent of all voters over 18 years of age in Great Britain and Northern Ireland. In one community 86 per cent of those eligible voted. For all of Wales the average was 62 per cent. The vote on the different questions was as follows:

1. Great Britain's membership in the League of Nations, Yes, 95.9 per cent.
2. Reduction of armaments by international agreement, Yes, 90.5 per cent.
3. Abolition of military aircraft by international agreement, Yes, 82.4 per cent.
4. Prohibition of private arms manufacture, Yes, 90.1 per cent.
- 5A. Combined economic and non-military measures against an aggressor nation, Yes, 86.7 per cent.
- 5B. Military measures against an aggressor nation, Yes, 58.6 per cent.

The votes cast totaled 11,559,165 and were distributed as follows:

Question	Yes	No
1	11,090,387	355,833
2	10,479,489	862,775
3	9,533,558	1,689,786
4	10,417,329	775,415
5A	10,027,608	635,074
5B	6,784,368	2,351,981

Coöperation of the United States with other governments and the League of Nations to reduce international tension is the first point of a 10-point American peace programme adopted by the Annual Meeting of the National Council for Prevention of War. The 10 points are:

(1) Reduction of Economic Tensions—Cooperation by our government with other governments and with the League of Nations for reduction of international tensions through such measures as stabilization of currencies, low-

ering of tariff barriers, improvement of inferior labor standards, and adequate access to raw materials.

(2) Mandatory Embargo Legislation—Enactment of legislation, before the present embargo law expires, embodying the following provisions:

(a) Mandatory embargo, as to the parties to an armed conflict, of arms and munitions of war, of loans and credits, and of such secondary munitions as minerals, oil and cotton; the carrying out of the provisions to be entrusted to the domestic civil authorities at ports of departure and not to military or naval action.

(b) Shipment of goods not otherwise prohibited to be at the shipper's risk during periods of armed conflict, and United States citizens traveling abroad to do so at their own risk.

On this question of embargo legislation the NCPW recognizes sincere differences of opinion about methods of preserving or restoring peace, and acknowledges them as valuable contributions to the process of finding the right solutions of unsolved questions of great importance and difficulty.

(3) "Peace in the Pacific" programme—(a) Recognition of the fact that provision for the relief of the present world economic situation is fundamental to the maintenance of peace in the Pacific. The "gentlemen's agreement" on trade relations recently negotiated with Japan by the State Department is heartily commended.

(b) Early repeal of the Oriental Exclusion Acts, placing China and Japan on an immigration quota basis (Japan's annual quota, 185; China's 105), as an expression of justice and recognition of fundamental racial equality.

(c) Acceptance in principle of the recommendations of the Lytton Commission of Inquiry and continued non-recognition of "Manchoukuo."

(d) Recognizing that it is not the policy of our government to protect by armed force our investments and interests abroad, insistence at the scheduled Naval Conference upon drastic reduction of tonnage and expenditure with no increases in the name of parity or any other arbitrary ratio.

(e) Widespread education concerning the entire Far Eastern problem, including all available data regarding the internal struggle in Japan between militarism and liberalism, and the internal situation in China towards reconstruction and national unity.

(f) Study of the problems of the second generation Chinese and Japanese on the Pacific Coast and in Hawaii and sincere cooperation in their struggle for social adjustment and for the rights of citizens.

(4) Amendment of the Philippines Independence Act—Revision of our tariff agreements with the Philippines on a reciprocal and equitable basis, abandonment of the U.S. naval base in the Philippines, and negotiation with other nations for perpetual neutralization of the Islands.

(5) Universal Draft Bill—Emphatic opposition to any universal draft bill.

(6) Military Disaffection Bill—Emphatic protest against the steadily mounting and ominous increases in expenditures for our army and navy as conducive to war and not to peace.

(8) World Court and League of Nations—Membership in the World Court and in the League of Nations on the basis of Senator Pope's resolution, which excludes commitment to the use of armed force and calls for recognition of the obligations of the Pact of Paris as the fundamental principle of the League Covenant.

(9) Military Training and Supreme Rights of Conscience—Support of the Nye-Kvale Bill to eliminate the compulsory feature of military training in civilian educational institutions, and encouragement of the rising tide of opinion and action, especially in the churches, to maintain the supreme rights of conscience.

(a) Through seeking revision of our citizenship requirements.

(b) Through making military drill optional in educational institutions where it exists, and

(c) Through aiding students who seek exemption from compulsory drill because of conscientious objections. We further declare our opposition to the entire programme of military training in educational institutions as being a systematic cultivation of the military mind and the perpetuation of a type of education which, when tested by its physical, moral, or intellectual results, does not justify its cost.

(10) Freedom of Teachers and of the Press—Recognizing that the establishment of peace in the world requires an intelligent public opinion, to which a free press and adequate educational institutions with free teachers are prerequisite, emphatic protest against curtailment of expenditures for public education and against any and all steps, such as the teacher's oath, designed to abridge the freedom of teachers and of the press.

Kellogg-Briand Peace Pact. Ethiopia appealed to the United States pointing out that Italy, one of the signatories to this treaty by which war "as an instrument of national policy" is formally renounced, was plainly threatening to use war as

the instrument of her national policy of subjugating the Ethiopian nation. The United States politely told Ethiopia that the United States would have nothing to do with that quarrel, and referred the Africans to the League of Nations.

Miscellaneous. The churches of the world have been doing some plain speaking in the face of the ominous drift toward war. The Executive Committee of the Universal Christian Council, at its meeting in Switzerland in late August, deeply moved by the threatened war between Italy and Ethiopia, appealed "to the whole of Christendom to unite in prayer and in declaring that such a war, undertaken without recourse to arbitration or other means of peaceful settlement, is an intolerable wrong to mankind and a sin against the law of Christ."

The Pope, on August 27, characterized wars of conquest as "something indescribably bad and horrible," and held that "the right of defense has limits of moderation which must be observed in order that the defense may not be guilty." The position of the Roman Catholic Church in Italy gives significance to this utterance.

The World Alliance for International Friendship Through the Churches affirmed the conviction that "any nation which breaks its plighted word not to use other than pacific means for settling international disputes will stand condemned not only by the moral judgment of human society but by the teaching and spirit of Jesus Christ." The Alliance also declared that "wherever a State makes claims which the Christian conscience feels to be against divine law, Christians must refuse to follow or to cooperate." The Alliance appealed for "a new foundation" for peace "through a firm determination to banish war by promoting arbitration and general disarmament, by engendering respect for treaties, and by strengthening and making more effective the League of Nations."

The World Convention of Churches of Christ, held in Leicester, England, in August, expressed its sincere hope "that the peace of the world will not be ruptured by war between Italy and Abyssinia." The growing militarism evidenced in new naval, army, and aircraft races was deplored and the conviction was recorded that "the inevitable end of such armament races is war."

The Archbishop of Canterbury and the Archbishop of Upsala, Primate of Sweden, recently dispatched a strongly worded telegram to the Secretary-General of the League of Nations "to prevent the outbreak of a war between two members of the League, which would shock the conscience of the world."

In Australia, the General Conference of the Methodist Episcopal Church declared that "war is contrary to the spirit, teaching and purpose of the Christian conscience, enlightened as it is with the Spirit of Christ." They also declared their "repudiation of war, of the manufacture of armaments, of exploitation of weaker nations, of secret treaties which involve the honor of the nations without the consent of the people, and of a narrow nationalism which refuses to recognize other members of the human family."

In the *Congressional Record* of September 10, as part of an address made by Congressman Maverick of Texas, there was reprinted a memorandum which had been circulated by the Naval Intelligence Section of the Department of the Navy, falsely describing the Federal Council of Churches, along with certain other organizations, as giving "aid and comfort to the Communist movement and

party." The same charge was repeated in substance by Admiral Standley, Chief of Naval Operations, in Atlantic City on September 17 in an address in which he attacked all those who were opposed to a great naval expansion.

A letter from the General Secretary of the Federal Council to the Secretary of the Navy, requesting information as to whether it is a policy of the Navy Department to allow any of its bureaus to be used as an agency for purposes of libel and slander of civilian organizations, brought only an evasive reply. The request for information was repeated in two subsequent letters to the Secretary of the Navy without any more satisfactory results. According to the Federal Council, evidence from other quarters indicated that something like a general barrage against the Protestant churches in general and the Federal Council in particular was being carried on by some of the officials of the Navy Department, who were determined to undermine the influence of any persons or groups who oppose their plans. The officers of the Federal Council therefore felt it necessary to take the matter to the White House. A conference was held with President Roosevelt by representatives of the Federal Council on November 20. He immediately voiced his concern over what had happened, displayed great regret that any group in the Navy Department should have so far transgressed its proper function as to make criticisms of the Federal Council and of the churches, and expressed his own confidence in their work. He not only disavowed the statement made about the Federal Council by officials of the Navy Department but also said that he would send word to both the Army and Navy Departments that henceforth they are to make no comment about any civilian organization and its politics, whether favorable or unfavorable, without his specific consent.

The Twenty-Fifth National Peace Congress of Great Britain was held June 28th to July 2d at the Friends' House in London. A distinguished group of speakers attended. The general subjects discussed were "Peace and the Pacific," "Peace and the British Empire," and "Towards a Collective System."

Prof. James T. Shotwell of Columbia University was elected President of the League of Nations Association. His predecessors in this office were former Associate Justice John H. Clarke, the late George W. Wickersham, and Raymond B. Fosdick.

PEARSON, ALFRED CHILTON. An English scholar and educator, died in London, Jan. 2, 1935. Born Oct. 8, 1861, he was educated at King's College School, London, and was graduated from Christ's College (Scholar), Cambridge in 1879, earning 1st class Classical Tripos, Part I, 1881 and Part II, 1883. Also, he highly distinguished himself in the examination for the Chancellor's Classical Medal in 1883, and was awarded the Hare Prize in 1889. Four years before this he was called to the bar of Lincoln's Inn, and in 1890 he accepted the position of second master at Bury St. Edmund's School, and two years later became Sixth Form master at Ipswich School. In 1893 he became assistant master at Dulwich College, where he remained until 1901. In 1900 he was appointed an examiner to the Oxford and Cambridge Schools' Examination board, and served as an examiner in the Civil Service Commission from 1914 to 1919.

His researches in the classics led to his appointment as Gladstone Professor of Greek at Liverpool

University in 1919, and Regius Professor of Greek at the University of Cambridge in 1921. He retired as Emeritus Professor because of ill health in 1928. In 1921 Professor Pearson became a Fellow of Trinity College, Cambridge, and in the following year was made an honorary fellow of Christ's College. He lectured at the Royal Institution (1923), and at Midland Institute (1924). From 1922 to 1925 he served as a governor of Dulwich College, and in 1926, Manchester University conferred upon him the honorary degree of Litt.D.

In his studies, Dr. Pearson abandoned the traditional belief of Jebb that the Laurentian manuscript had a monopoly of the truth and gave credence to other manuscripts and to the work of Greek lexicographers. He was never a slave to any particular theory and scorned to pass off some interesting error as truth. He was a frequent contributor to *Classical Review*, *Classical Quarterly*, and the *Journal of Philology*, and also supplied material for Hastings's *Encyclopædia of Religion and Ethics*. He edited W. G. Headlan's *Æschylus' Agamemnon* (1910); *Fragments of Sophocles* (3 vols., 1917); and a critical text of the seven extant plays of Sophocles in the Oxford Classical texts series (1924). His own writings included, *Fragments of Zeno and Cleanthes* (1891), the fruit of his work for the Hare prize; editions of Euripides' *Helena* (1903); *Heraclida* (1907); *Phoenissæ* (1909); an abridgment of Jebb's *Sophocles' Ajax* (1907); *Inaugural Lecture on Verbal Scholarship*, and a lecture on *Tragedy and Comedy* at the Leeds Branch of the Classical Association (1925).

PECK, ANNIE S. An American mountain climber and lecturer, died in New York City, July 18, 1935. She was born in Providence, R. I., Oct. 19, 1850, and in 1878 graduated from the University of Michigan, later studying in Germany from 1884-85. In the latter year she attended the American School of Classical Studies in Athens, being the first woman to do so, and specialized in Greek and archaeology. Upon her return to the United States she turned to teaching, first in the public schools of her native city, and later in schools in Saginaw, Mich., Cincinnati, Ohio, and Montclair, N. J. Subsequently, she taught Latin at Purdue University and at Smith College. In 1887 she began to give private lectures on Greek and Roman archaeology, and three years later entered the public lecture field, speaking on Greek archaeology, mountain climbing, and South America.

Her first experience in mountain climbing was obtained by her ascent of Mt. Shasta, Calif., in 1888. In 1895 she conquered the Matterhorn, and two years later Popocatepetl and Orizaba, reaching an altitude of nearly 18,500 ft., the highest point then attained by a woman. In 1900 she ascended Funfingerspitze in the Tirol and also the hazardous Jungfrau. In the early part of the century she became interested in locating a peak higher than Aconcagua (23,080 ft.) in the Andes, and in 1903, 1904, 1906, and 1908 explored South America, reaching 20,500 ft. on Mt. Sorata in Bolivia in 1904. In that year, as well as in 1906, she attempted the ascent of Mt. Huascarán in Peru, but only reached 18,000 ft. On Sept. 2, 1908, accompanied by Swiss guides, she reached the summit of 22,045 ft. Here she established a record of ascending to the highest altitude ever attained by an American on the western hemisphere. For her exploit she was decorated with a gold medal by the Peruvian Government, and the northern peak of the twin mountain was named Cumbre Ana Peck in her honor by the Lima Geographical Society, which also awarded

her the silver slipper (stirrup). In 1911 she published an account of the difficulties and hazards of this ascent in her book, *A Search for the Apex of America*.

She made her first ascent of Massif Coropuna (21,000 ft.) in southern Peru in 1911. In 1930, in her 80th year, she ascended Mt. Madison in the White Mountains, a distance of 5380 ft., and Mt. Crescent in Randolph, N. Hamp., 3280 ft. high.

Through her exploration, she became deeply interested in things South American, and went as delegate to the second Pan-American Conference of Women in connection with the third Pan-American Scientific Congress, held in Lima, and was the only United States delegate to read a paper in Spanish. In 1900 she was the official delegate from the United States to the International Congress of Alpinists in Paris. Before South American audiences she lectured in Spanish and Portuguese on the United States industries and educational institutions in 1915 and 1916, and in 1922 attended the Brazil Centennial Exposition. She made her ninth visit to the South American continent in 1925, and her tenth visit, made by aeroplane, occurred in 1929-30. On her 80th birthday she received the Order Al Merito of the Chilean Government.

Two of the most authoritative volumes written on South America—*The South American Tour* (1914, 1924) and *Commercial and Industrial South America* (1922, 1927)—were written by Miss Peck. In 1932 she wrote *Flying Over South America—20,000 Miles by Air*.

PENNSYLVANIA. Population. On Apr. 1, 1930 (Fifteenth Census), 9,631,350; July 1, 1934 (latest Federal estimate), 9,826,000; 1920 (Census), 8,720,017. Philadelphia (1930) had 1,950,961 inhabitants; Pittsburgh, 669,817; Scranton, 143,433; Erie, 115,967; Reading, 111,171; Harrisburg, the capital, 80,339.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame) ...	1935	2,429,000	3,241,000*	\$32,734,000
	1934	2,420,000	2,562,000*	39,711,000
Corn	1935	1,277,000	58,742,000	41,119,000
	1934	1,216,000	52,896,000	43,375,000
Potatoes	1935	198,000	22,572,000	13,543,000
	1934	200,000	34,000,000	14,620,000
Wheat	1935	904,000	18,960,000	15,171,000
	1934	869,000	14,759,000	13,582,000
Oats	1935	897,000	26,013,000	10,925,000
	1934	906,000	24,915,000	13,205,000
Apples	1935	11,440,000	8,351,000
	1934	8,554,000	7,870,000
Tobacco	1935	20,700	26,910,000*	3,229,000
	1934	15,200	18,255,000*	1,698,000
Buckwheat	1935	146,000	2,847,000	1,480,000
	1934	138,000	3,105,000	1,708,000

* Tons. † Pounds.

Mineral Production. Anthracite production in 1935 amounted to 51,003,000 net tons (1935) compared with 57,168,291 (1934). The wholesale piling ("bootlegging") of coal from collieries' deposits had begun by 1934 and was estimated to have totaled 3,000,000 tons for that year, but did not appear in official totals given above.

The production of bituminous coal rose to some 90,795,000 net tons (1935) from 89,825,875 (1934). Coal to the quantity of 11,207,690 tons (1934), used in coke ovens, yielded 7,554,995 net tons of coke, of which the value was \$30,158,115; more than nine-tenths of the coke came from byproduct ovens.

Blast furnaces consuming iron ore mainly from

other States produced 4,207,944 gross tons of pig iron in 1934 as against 3,733,570 in 1933. The furnaces' shipments of pig iron totaled 4,173,412 tons for 1934 and 3,952,862 for 1933; in value, \$76,740,066 (1934) and \$62,797,008 (1933). The production of steel (1934) attained 570,817 tons of Bessemer and 6,390,342 of open-hearth.

There were produced (1934) 14,516,000 barrels of petroleum, the highest total subsequent to 1898; the Bradford field predominated. Natural gas attained a yield, for 1934, of some 84,000,000 M cu. ft., 17 per cent above 1933, largely due to wells in Potter County. Producers' sales of lime (1934) totaled some 441,000 short tons, in value, \$3,110,000; those of slate attained \$1,237,477.

Education. The legislation of 1935 included the restoration of teachers' salaries to conformity with the State schedules that had been in force before the reductions made during the time of depression. The statutory restrictions on the employment of minors were increased, expectedly with the effect of increasing school attendance.

Charities and Corrections. The central body exercising in 1935 the supervisory functions over institutions maintained by the State for the care and custody of persons was the Department of Public Welfare. It had been created by statute in 1921. At its head was a Secretary of Welfare (J. Evans Scheehle, M.D.), holding by appointment for a term of four years.

The State institutions of care and custody and the numbers of their respective inmates on May, 31, 1935, were: Eastern State Penitentiary (two sites), Philadelphia and Graterford, 3143; Western State Penitentiary, Pittsburgh and Rockview, 1995; Pennsylvania Industrial School, Huntingdon, 1247; State Industrial Home for Women, Muncy, 265; Pennsylvania Industrial School, Morgantown, 573; eight State hospitals for mental disorders, at Allentown (1634), Danville (1915), Fairview (791), Harrisburg (1905), Norristown (3483), Torrance (1628), Warren (2048), and Wernersville (1374); three institutions for mental defectives, at Pennhurst (1742), Polk (2924), and Laurelton (670); a State Colony for Epileptics, at Selinsgrove, 441; and ten medical and surgical hospitals (chiefly for special needs in mining districts), at Ashland (171), Blossburg (92), Coal-dale (81), Connellsville (78), Hazelton (148), Locust Mountain (51), Nanticoke (113), Philipsburg (105), Scranton (184), and Shamokin (107).

Legislation. Governor Earle, shortly after taking office, recommended to the Legislature a number of taxes designed to produce revenue at the rate of \$5,000,000 a month, with which to meet part of the cost of subsistence for the needy unemployed, as demanded by the FERA. He also proposed the enactment of other taxes, for divers purposes, so that the total of the new taxes sought approximated \$125,000,000 a year. The taxes to meet the FERA's requirements were enacted. Later was enacted a graduated income tax, taking 2 per cent on the yearly net income of \$5000 or less, and rising to 8 per cent on net of \$100,000 and over. The chief taxes enacted, other than the income tax, were: repeal of manufacturers' exemption on capital stock; increase of the levy on utilities' gross receipts to 14 mills on the dollar, from 8 mills; a net-income tax on corporations at 6 per cent; an excise of a cent a package on cigarettes; a levy of five cents per \$100 on the face of documentary papers; an increase to five cents a gallon, from three cents, in the tax on sales of gasoline; and a tax of 4 per cent on the cost of admittance to amusements. The budget, as adopt-

ed, provided \$301,088,837 for the ensuing two years.

Provision was made for the payment of State pensions to blind persons through an appropriation of more than \$3,000,000. The penalties against delinquency in the payment of taxes were abated on condition of payment by November 1. A law over a century old, recently again invoked by tax collectors, providing imprisonment for failure to pay taxes, and another law allowing sale of chattels for unpaid taxes, were repealed.

At the instance of Governor Earle the Legislature voted a proposal for revision of the State's constitution by a convention, provided that the popular vote should approve. An act was passed to prohibit discrimination against persons "because of race, creed, or color" in places open for public patronage. The private right to bring civil suit on the ground of alienation of affection or breach of promise to marry was abolished, under the pressure of a simultaneous movement in many States to end the common abuse of such suits.

Political and Other Events. Governor Earle, the first Democrat in 44 years to assume the office, was inaugurated on January 15. He strongly advocated, at various times, broad "modernizing" alteration of the constitutions of both State and Nation.

At a special election held on September 17 the popular vote rejected by a heavy majority the submitted proposal for a constitutional convention. The strength of the influence of the labor unions, which favored the idea of "modernized" constitutions, and of the "new deal" sentiment evidenced in the Democratic victory of 1934, proved insufficient to overcome conservatism. Governor Earle prompted a Legislative investigation of the State Liquor Control Board, established in 1933, which had failed to develop the business of the State liquor shops to anything like the anticipated \$150,000,000 a year of Governor Pinchot's original estimate. Nothing was found against the probity of the members, but it was made to appear that the Board had made "secret contracts" with distillers and that it had purchased more stock than the shops could quickly sell. The Governor removed the Board's chairman, Robert S. Gawthrop, and another member resigned, causing vacancies for the Governor to fill by appointment.

The FERA's figures, published March 1, showed that the cost of public support for the destitute unemployed in Pennsylvania during 1934 had exceeded that for any other of the States except New York; of \$146,278,585 thus expended, the FERA had furnished \$105,761,449, or some 72 per cent; the State, \$30,065,337; and subdivisions, \$10,451,799. Some 450,000 families and single persons were stated to be dependent on this sort of public support in March, 1935, in the entire State. Improvement occurred later in the year by reason of increase in ordinary employment and through the creation of paid jobs under the Federal "work relief" programme. The President allocated \$57,572,000 on October 8 for immediate work-making enterprises in the State.

Philadelphia early in the year required \$2,500,000 a month for its needy unemployed; but the funds of the city furnished no part of the monthly cost. Mayor Moore maintained that the city had exhausted its power to borrow and that it could not safely impose heavier local taxation. In the bituminous coal field of the State the agreement executed as to wages and conditions of labor, enforced by the passage of the Guffey Coal Act, helped business in the latter part of the year. In the anthracite field widespread unemployment continued.

Idle miners in considerable number were reported to have taken to mining anthracite unlawfully on their own account, tapping the companies' coal deposits through small shafts dug in widely-scattered spots. A representative of the Anthracite Institute asserted on September 25 that stolen coal to the value of some \$20,000,000 had been sold. Juries could not be brought to convict offenders brought to trial for the thefts. During Governor Pinchot's administration had been enacted a law depriving the company-controlled Coal and Iron Police of the right to act except on companies' property. The anthracite-mining companies generally owned mineral rights only: not the land overlying the coal; they were thus powerless any longer to use the special police to stop the stealing of their coal on a huge scale. See FLOODS.

Controller S. Davis Wilson, Republican, was elected Mayor of Philadelphia on November 5, by a plurality of nearly 50,000 votes over John B. Kelly, Democrat.

Officers. The chief officers of the State, serving in 1935, were: Governor, George H. Earle; Lieutenant-Governor, Thomas Kennedy; Secretary of the Commonwealth, David L. Lawrence; Attorney-General, Charles J. Margiotti; Auditor, Frank E. Baldwin; Treasurer, Charles A. Waters; Superintendent of Public Instruction, Lester K. Ade.

Judiciary. Supreme Court: Chief Justice, John W. Kephart; Associate Judges, George W. Maxey, James B. Drew, William B. Linn, Horace Stern, H. Edgar Barnes.

PENNSYLVANIA, UNIVERSITY OF. A non-sectarian institution of higher education in Philadelphia, founded in 1740. It is composed of the college of arts and sciences, the college of liberal arts for women, the Towne Scientific School (engineering and chemistry), the Moore School of Electrical Engineering, the Wharton School of Finance and Commerce, the school of fine arts (architecture, fine arts, music), the school of education, the graduate school, and the professional schools of medicine, graduate medicine, law, dentistry, veterinary medicine. An affiliation exists with the Pennsylvania School of Social Work under which students in that School may, under certain conditions, receive University certificates and degrees. The 1935 autumn enrollment was 13,421 including all schools and departments. Of those enrolled 5630 were registered in the undergraduate schools, 2879 were registered in the graduate and professional schools, 4921 were registered in the evening, extension, and summer schools. The enrollment of the 1935 summer school was 1499. The faculty numbered 1310. The productive funds amounted to \$18,998,279. The income for the year from all sources, exclusive of hospitals and museums, was \$5,440,103. The library contained 826,037 bound volumes and 170,000 pamphlets. President, Thomas S. Gates, Ph.D., LL.D. Provost, Josiah H. Penniman, Ph.D., LL.D.

PENNSYLVANIA STATE COLLEGE, THE. A nonsectarian institution for the higher education of men and women at State College, Pa., founded in 1855. On Nov. 1, 1935, the undergraduate enrollment totaled 4802 and the graduate and special enrollments, 577. The 1935 summer session enrollment was 2826. The resident faculty numbered 731. The productive funds amounted to approximately \$517,000, and the income for operation for the year was \$4,126,039. The library contained 158,000 volumes. There became effective in September, 1934, the division of the school of liberal arts into a lower and an upper division and the reorgani-

zation of the school of education on a professional basis, offering only the last two years of undergraduate work and graduate work leading to the degrees of master and doctor of education. Extension activities of the college were coordinated under an assistant to the president in charge of extension. There were established in DuBois, Hazleton, Pottsville, and Uniontown undergraduate extension centres, after a survey had indicated that such need was not being met by any other educational agency. The college is committed to this work for only one year at a time in each centre, the courses offered not exceeding the levels of the freshman and sophomore years. President, Ralph D. Hetzel, LL.D.

PERU. A South American republic, comprising 23 departments. Capital, Lima.

Area and Population. Peru has an estimated area of 482,133 square miles and a population estimated at 6,700,000 on Dec. 31, 1933. The white population was placed at about 600,000. No census had been taken since 1876, when Indians comprised 57.6 per cent of the total population, mestizos 24.8 per cent, whites 13.8 per cent, and Asiatics 1.9 per cent. Lima had 281,425 inhabitants in 1931 and Callao 63,728. Estimated populations of the other chief cities in 1934 were: Arequipa, 70,000; Cusco, 40,000; Chiclayo, 35,000; and Trujillo, 30,000. Spanish is the language of the educated classes. The natives speak mainly Aymara or Quechua. Roman Catholicism is the state religion.

Education. Primary education is nominally free and compulsory but about 50 per cent of the population remains illiterate. The election rolls, restricted to literate male voters of 21 years or more, recorded only 392,263 names in 1931. The primary school enrollment in 1933 was 383,506; public high schools, 9440; normal and other schools, 1575. On May 10, 1935, President Benavides announced that between 1932 and 1934 the school enrollment increased by 20,000, the number of teachers by 2000, and educational expenditures by 2,000,000 soles. The University of San Marcos at Lima, closed due to student agitation in 1932, was reopened in 1935. There are smaller universities at Arequipa, Cusco, Trujillo, and Lima (Catholic University).

Production. Agriculture is the chief occupation, supporting 80 per cent of the population, although mining accounted for half the value of all exports in 1933. Cotton production in 1934-35 was about 265,000 bales (of 480 lb.) and exports in 1934 totaled 67,212 metric tons, valued at 81,705,000 soles. The price of Peruvian cotton had risen 79 per cent in two years, while production costs remained stationary. The other leading crops were: Cane sugar, 420,000 metric tons in 1934 (433,000 in 1933); coffee, 14,500,000 lb. in 1934; hulled rice, 54,843 metric tons in 1933-34; wheat, 72,800 metric tons in 1933-34. Wool production (1933) was 7500 metric tons; guano (1933-34), 150,000 metric tons; petroleum, 16,300,000 bbl. in 1934 (13,257,000 in 1933). The output of other minerals in 1933 was (in metric tons): Coal, 30,000; copper, 24,853 (27,200 in 1934); lead, 1217. The 1933 production, in kilograms, of zinc was 57,000; antimony, 40,000; bismuth, 292,433; molybdenum, 6452. Manufacturing expanded rapidly during the world economic depression of 1929-35. In 1933 there were 625 industrial establishments,

with 18,508 workers; the wages paid during the year amounted to 15,281,808 soles.

Foreign Trade. Peruvian exports in 1934 increased 18 per cent and imports 61 per cent over 1933, reaching the approximate levels of 1929. The 1934 imports totaled 171,252,000 soles (107,437,000 in 1933) and exports 305,094,000 soles (256,969,000 in 1933). The United States in 1934 supplied 27.1 per cent of the imports by value (27.4 per cent in 1933); Great Britain, 17.6 (18.0); Germany, 8.3 (9.6); France, 8.2 (3.6). Of the total exports, Great Britain in 1934 took 33.8 per cent (36 per cent in 1933); United States, 14.2 (16); Germany, 11.1 (7.3). The chief exports, in order of value in 1934, were raw cotton, petroleum, gasoline, copper bars, and raw sugar. Machinery and vehicles, cotton manufactures, and wheat were the main import items.

Imports in 1935 totaled 174,732,925 soles; exports, 308,958,162 soles. United States statistics for 1935 showed general imports from Peru of \$7,453,992 (\$6,190,978 in 1934) and exports to Peru of \$12,173,947 (\$9,891,498).

Finance. Budget estimates for 1934 and 1935 balanced at 111,199,000 and 131,313,000 soles, respectively. Actual 1934 returns were: Receipts, 126,235,000 soles; expenditures, 123,663,000 soles, leaving a gross surplus of 2,572,000 soles and a net surplus of 2,318,000 soles.

The public debt on June 30, 1935, totaled 693,671,902 soles (external, at par of exchange, 463,364,405; internal, 55,008,709; floating, 175,298,788). The sol (nominal par value, \$0.47) exchanged at an average of about \$0.23 in 1934, \$0.18 in 1933, and \$0.27 in 1932.

Communications. Peru in 1933 had about 11,200 miles of highways suitable for motor traffic and in 1934 311 miles of additional roads were completed. The Central Highway, extending 116 miles from Lima over the Andes to Oroya, was opened to traffic in June, 1935. Railways open to traffic in 1933 aggregated 2868 miles, including 640 miles of State line. Air lines connected Lima with other cities of the republic and with the inter-American air network. A modern new airport three miles from the centre of Lima was formally opened on Nov. 3, 1935. The net register tonnage of overseas shipping entering Peruvian ports with cargo and in ballast in 1933 was 14,010,000; tonnage cleared, 13,961,000.

Government. The Constitution of Apr. 9, 1933, vested executive power in a President elected by popular vote for five years and ineligible for re-election. Legislative power was to rest in a Congress of two chambers—a Chamber of Deputies of 120 members elected for five years and a Senate of 40 members elected for six years, with one-third of the Senate renewed every two years. The suffrage was restricted to literate males 21 years or more of age. The Constitution provided that until Dec. 8, 1936, when the next presidential and legislative term was to begin, the Constituent Assembly would be divided into a Chamber of Deputies and a Senate. President in 1935, Gen. Oscar Raimundo Benavides, elected by the Constituent Assembly Apr. 30, 1933, to complete the term of the assassinated President, Luis M. Sánchez Cerro.

HISTORY

Foreign Relations. The ratification by the Colombian Congress in September, 1935, of the Leticia Protocol signed by Peru and Colombia in Rio de Janeiro on May 24, 1934, permanently liquidated their boundary dispute in the upper Amazon basin, which brought them to the verge of war during

1932-33 (see *COLOMBIA* under *History*). The Peruvian Congress had ratified the treaty Nov. 2, 1934. The long-pending boundary controversy with Ecuador assumed a threatening aspect towards the end of 1935, leading the Peruvian Government to propose the submission of the dispute to the Permanent Court of International Justice at The Hague (see *ECUADOR* under *History*). Direct negotiations for a settlement of the dispute had been suspended in August, 1934.

Peru's rapprochement with her old enemy, Chile, inaugurated by the settlement of the Tacna-Arica dispute in 1929, was furthered in 1935. An important commercial treaty, greatly reducing tariff barriers between the two countries, was signed in March and ratified by the Peruvian Congress in November. Six other conventions signed with Chile on July 5 provided for closer Chilean-Peruvian collaboration with regard to civil registration, counterfeit currency, motion picture censorship, the census, judicial requests, and intellectual interchange (see *CHILE* under *History*). Five conventions of a similar nature were signed with Argentina on July 2. Peru cooperated with Argentina, Brazil, Chile, Uruguay, and the United States in the negotiations at Buenos Aires which resulted in the Bolivian-Paraguayan truce agreement of June 12, 1935. She also participated in the subsequent Chaco peace conference at the Argentine capital. See *BOLIVIA* and *ARGENTINA* under *History*.

Domestic Affairs. While the Benavides Government achieved marked success in consolidating Peru's friendly relations with her neighbors, it retained power at home only through strict repression of opposition movements, and especially of the aggressively hostile Aprista organization under Raúl Haya de la Torre. The Benavides régime, representing the conservative business and clerical elements, was the bulwark of the feudal economic and social system of Peru against the forces of radicalism and liberalism, which were determined upon the complete reorganization of the nation. In January, following an unsuccessful radical revolt in Cajamarca, President Benavides upheld the existing curbs on civil liberties. Later additional repressive measures were introduced, including more rigorous censorship of the press, the exclusion from the country of foreigners and Peruvian citizens suspected of seditious activities, and harsher penalties against terrorists. The prohibition of coeducation was another evidence of the government's conservative tendencies. On October 9 Gen. Manuel Rodríguez was named head of a reorganized cabinet, containing several new ministries.

In the economic field, the outstanding development was the continuance of the business revival which had gained rapid headway in 1934. Foreign trade, government revenues, and most other indexes of national prosperity showed substantial increases, and Peru remained one of the two South American countries which did not find it necessary to resort to restriction of foreign exchange transactions. Resumption in part of the service on the foreign debt, suspended since May, 1931, was provided for in the 1936 budget estimates submitted to Congress in September, 1935. Radical amendments to the banking law of May 23, 1931, were introduced by the decree of Mar. 14, 1935. Perhaps the most striking change was one permitting the banks to hold government obligations up to 45 per cent of their capital and reserves, as compared with the 25 per cent limit previously in effect. The threat of inflation inherent in the government's monetary policy led to the hoarding of silver coins. To counteract this, the

government on May 2, 1935, prohibited the buying, selling, hoarding, and exportation of these coins. About the same time the Banco Central de Reserva was authorized to coin and issue a new metal piece of subsidiary currency with a face value of 50 centavos or one-half sol, containing no silver.

The public works programme, in which irrigation projects received the greatest attention, was continued and expanded. Some steps were taken towards wider distribution of the land. In order to retain its export markets in Great Britain and the United States, the government on July 13, 1935, restricted imports of cotton goods from Japan to 204,000 kilograms, while the quotas for Britain and the United States were fixed at 845,000 and 476,000 kilos, respectively. Japanese textiles had made rapid inroads upon the Peruvian market.

Peru during 1935 celebrated both the 114th anniversary of its national independence and the 400th anniversary of the founding of Lima by Francisco Pizarro.

PETROLEUM. The production of crude petroleum in the United States during 1935, according to a preliminary report of the U.S. Bureau of Mines, totaled 993,942,000 bbl. (of 42 gal. to the bbl.). This was an increase of about 86,000,000 bbl. over 1934, but was slightly under the record (1,007,323,000 bbl.) of 1929. The domestic demand for motor fuel gained 6.3 per cent over 1934, with a new record of 432,556,000 bbl., as against 407,106,000 bbl. in 1934. Exports of motor fuel rose to 30,380,000 bbl. as compared with 24,686,000 bbl. in 1934. Stocks of finished and un-

finished gasoline totaled 56,693,000 bbl. at the close of the year. Comparative figures of production and consumption and stocks for 1934 and 1935 are given in Table I.

In the principal fields of the United States, Texas increased its yield to more than 391 million barrels of crude petroleum, almost half of it (175,918,000 bbl.) from the East Texas field. California rose to the second production State with 207,832,000 bbl., a gain of 33½ million barrels over 1934. Oklahoma dropped to third position with 185,348,000 bbl. The preliminary figures for 1935 as compared with 1934 for all States are shown in Table II.

TABLE II—PRODUCTION OF CRUDE PETROLEUM BY STATES

	[Thousands of barrels of 42 gallons]	
	1935	1934

Total United States	993,942	908,065

* Includes Missouri, Mississippi, Tennessee, and Utah

The total production of motor fuel in 1935 rose to 465,514,000 bbl. as compared with 423,801,000 bbl. in 1934. Of the total for the year, 219,583,000 bbl. were straight-run gasoline; 207,537,000 bbl. cracked gasoline; 38,858,000 bbl., natural gasoline, and 1,877,000 bbl., benzol.

In a study of the costs of producing crude petroleum, carried on in part before the invalidation of the NRA and completed voluntarily thereafter, the Petroleum Administration Board, on the basis of reports covering 67.9 per cent of the total domestic production, found that the cost of production in 1934, including interest on investment at 6 per cent and after deducting by-product sales and miscellaneous receipts, for the country as a whole per barrel of company interest oil was \$0.775; and the selling price was \$0.984. However, the per-barrel cost of individual States varied materially. To some extent the variations can be traced to fluctuations in production because a large percentage of the expenses remained the same regardless of the quantity produced. Hence, those States showing a relative gain in production sufficiently large to offset higher labor and material costs, although a few specific items may have increased, invariably showed a lower overall cost; conversely, for States showing a decline in production costs ordinarily rose in greater proportion because of these factors.

The itemized cost of production by areas for the year 1934 is shown in Table III on page 569.

It will be noted that California, with an average of \$0.595 per barrel, was the lowest cost area; while the highest, or \$1.56 per barrel, is that recorded for the Eastern States. The average for that group of States comprising the Mid-Continent-Gulf area was \$0.778, or approximately the same as that of all States, whereas States in the Rocky

Group B: Texas, Oklahoma, Kansas, Arkansas, Louisiana, and New Mexico.
Group C: Wyoming, Montana, and Colorado.
Group D: Illinois, Indiana, Ohio, Michigan, Kentucky, West Virginia, Pennsylvania, and New York.

Mountain area had a cost of \$1.08 per barrel.

It also appears from the same table that the lowest cost item for other than the Eastern area was amortization of intangible development cost, and for that area it is higher by 5¢ per barrel than depletion. Credits for by-products and miscellaneous revenue, which for the most part is sales of gas, approximates 6¢ per barrel for all States. In California, however, it bulks very large, amounting to \$0.177 per barrel of oil produced, or in excess of 28 per cent of the direct cost items.

PETROLEUM ACT. See UNITED STATES under *Congress*.

PHILIPPINES. The largest island group of the Malay Archipelago, transformed on Nov. 15, 1935, from an insular dependency to a self-governing commonwealth under the sovereignty of the United States. Capital, Manila.

Area and Population. Including 7083 separate islands, with a total area of 114,400 square miles, the Philippines had a population estimated on July 1, 1935, at 13,099,405 (10,314,310 at the 1918 census). The largest islands are: Luzon, 40,814 square miles; Mindanao, 36,906; Samar, 5124; Negros, 4903; Palawan, 4500; Panay, 4448; Mindoro, 3794; Leyte, 2799; Cebu, 1695; Bohol, 1534; and Masbate, 1255. About 91 per cent of the people are Christians (mostly Roman Catholics) and 9 per cent Mohammedans (Moros) and pagans. English and Spanish, the languages of government and commerce, are spoken by about 1,500,000 and 660,000, respectively. Tagalog, Ilocano, and Visayan are the chief native languages. Estimated populations of the chief cities in 1935 were: Manila, 353,418; Cebu, 82,032; Iloilo, 45,236; Laoag, 42,901.

At the 1930 census there were 45,208 Filipinos in the United States and 63,052 in the Territory of Hawaii. For the fiscal year ended June 30, 1935, 216 Filipinos entered the United States and 1016 departed, while 152 entered Hawaii and 3003 departed. Upon the acceptance of the Independence Act by the Philippine Legislature May 1, 1934, immigration into continental United States from the islands was restricted to a quota of 50 annually. Living births in the Philippines numbered 459,682 in 1933; deaths, 227,594.

Education. Primary education is free, secular, and coeducational. A total of 1,173,735 pupils, or 35 per cent of those of school age, were enrolled in 7671 public elementary schools in 1933-34; there were 26,957 teachers (188 Americans and 26,769 Filipinos). For public, vocational, secondary, and higher education, there were 242 special schools of various kinds and the University of the Philippines at Manila, with 5600 students in 1934-35. Private schools in 1934-35 numbered 404, with 90,866 pupils.

Production. Agriculture is the basic industry. Out of 39,657,000 acres of land suitable for farming, 10,421,696 acres were under cultivation in 1933. The value of agricultural production (1933) was about \$142,345,310. Sugar is the main crop, constituting 61 per cent of the value of all exports in 1933 and providing 30 per cent of the national income, 40 per cent of the Manila Railroad freight revenue, and 60 per cent of the government revenue. Banks made 47 per cent of their loans on sugar and 15 per cent of the population was dependent upon the industry. Sugar production in 1934-35 was 760,000 metric tons (1,430,000 in 1933-34); copra (1934 exports), 351,000 metric tons (308,750 in 1933); abaca (Manila hemp), 1,423,490 bales in 1934 (1,220,650 in 1933); tobacco (1933-34), 41,800 metric tons. Rice, corn, maguey, rubber, bananas, and other fruits are also grown. Rubber exports in 1934 were 450 long tons (245 in 1933).

Fishing, lumbering, mining, and manufacturing are important. Gold production showed a rapid increase after 1928, reaching 10,350 kilograms, valued at about \$11,850,000, in 1934. Iron and chromite deposits were opened up in 1935, the first shipment of iron ore to Japan being made in January and the first shipment of chromite ore to the United States following in October. Small quantities of coal, cement, salt, lime, etc., also are produced. The islands in 1934 had 45 sugar mills, 10 coconut oil factories, 6 desiccated coconut factories, 50 fibre grading plants, 85 cigar factories, 25 cigarette factories, 2294 rice mills, and 194 electric plants.

Overseas Trade. Total imports and exports for the calendar years 1929-35, and Philippine trade with the United States are shown in the accompanying table.

PHILIPPINE FOREIGN TRADE
[In thousands of dollars]

Year	Total imports	Imports from U. S.	Total exports	Exports to U. S.
1929	\$147,160	\$92,593	\$164,447	\$124,465
1930	123,093	78,183	133,167	105,342
1931	99,179	62,140	103,972	83,422
1932	79,395	51,298	95,338	82,648
1933	67,361	43,540	105,771	91,313
1934	83,607	54,376	110,404	91,844
1935	85,524	94,245

Exports of raw and refined sugar in 1934 totaled 1,134,626 long tons, valued at \$65,454,581; Manila hemp, 171,743 long tons, valued at \$8,661,568; copra, 337,291 long tons, valued at \$8,605,125; coconut-oil, 142,547 long tons, valued at \$6,794,871; cigars, 222,820,000, valued at \$3,605,510; desiccated coconut, 51,886,886 lb., valued at \$2,254,540; leaf tobacco, 28,943,356 lb., valued at \$1,391,046; cordage, 18,339,701 lb., valued at \$1,334,110. Exports of embroidery in 1934 were valued at \$2,666,420. The leading import items in 1934 were: Cotton cloth, \$21,108,000; iron and steel manufactures, \$15,135,000; mineral oils, \$12,447,000; other cotton manufactures, \$10,135,000;

machinery and parts, \$7,515,000; automobiles and trucks, \$6,022,000. The United States in 1934 purchased 84 per cent of the total Philippine exports, including practically all of the sugar shipments (87 per cent of the total in 1933). Japan, France, Great Britain, and China were the other chief export markets. Of the 1934 imports, the United States supplied 65.5 per cent (65 in 1933); Japan, 12.5 per cent (8 in 1933). Germany, China, and Great Britain, in the order named, were other sources of supply.

United States statistics for 1935 showed general imports from the Philippines of \$96,827,563 (\$87,811,089 in 1934) and exports to the Philippines of \$52,595,312 (\$47,128,516 in 1934).

Finance. Revenues of the insular government for the fiscal-calendar year 1934 amounted to \$39,337,376 (\$35,012,967 in 1933) and expenditures totaled \$35,359,795 (\$34,767,515 in 1933). The total current surplus (general, special, and bond funds) as of Dec. 31, 1934, was \$37,589,595, compared with \$33,612,014 on Dec. 31, 1933, the increase of \$3,977,581 representing the excess of income over expenditure for 1934. Budget estimates for 1936 called for expenditures of \$21,600,000.

The bonded indebtedness of the insular government on Dec. 31, 1934, was \$58,253,850 and that of the Provinces and municipalities \$9,168,850, or a total of \$67,422,700. Deducting from this total collateral bonds with a face value of \$6,698,850, issued against provincial and municipal bonds, and the cash and investments accumulated in various sinking funds, the resulting net balance of insular bonded indebtedness as of Dec. 31, 1934, was \$48,616,749. The unit of currency is the peso, with a value of 50 cents in U.S. money.

Communications. The opening of regular air-mail and passenger service between the United States and the Philippines in November, 1935, represented a major addition to the Philippines' communications system. On the first regular trans-pacific trip, one of the Pan American Airways Clipper planes left Alameda, Calif., on November 22 and arrived in Manila November 28, after stops at Hawaii, Midway and Wake Islands, and Guam. Shortly before the Philippine Legislature had granted a 20-year concession to the company. The opening of another line from Manila to Batavia, Netherland India, scheduled for February, 1936, would make Manila an important station on a complete airways network encircling the globe. New local air lines from Manila to Davao and from Manila to the gold mining centre of Camarines Norte were opened in 1935. There were 75 aeroplane landing fields at the end of 1934.

Railways in 1932 extended 986 miles, the chief system being the government-owned Manila Railroad (705 miles on Luzon). Railway carloadings declined 29 per cent in 1934 due to the falling off in sugar shipments. Radio telephone service was established with Japan in 1935. The 1934 high-way mileage was 9667 miles.

Government. For the Commonwealth Government established in 1935, see *History*; for the Territorial Government which it replaced see 1934 NEW INTERNATIONAL YEAR BOOK, p. 554. Governor General in 1935, Frank Murphy (assumed office June 15, 1933).

HISTORY

The Commonwealth Established. The Philippines took a great step towards their long-sought goal of complete independence when the Commonwealth government, authorized by the

Tydings-McDuffie Act of 1934, was formally established on Nov. 15, 1935, with Manuel Quezon as its first President. The Islands then embarked upon a 10-year transition period of controlled autonomy, to be followed by complete independence on July 4, 1946.

The Constitution of the Commonwealth was framed by a Constitutional Convention, which convened in Manila July 30, 1934, and completed its task on Feb. 8, 1935. A committee of members of the convention then went to the United States to present the new fundamental law to President Roosevelt. He approved the document on March 23, as conforming substantially to the provisions of the Tydings-McDuffie Act. After certification by the President, the Constitution was then submitted to the voters of the Islands at a plebiscite held May 14. They approved it with an overwhelming majority—1,213,046 for ratification and 44,963 against.

Elections to choose a President, Vice President, and a National Assembly of 98 members, as provided in the new Constitution, were called for September 17. Backed by a coalition of their respective Nationalist-Democratic and National Pro-Independence parties, Manuel Quezon and Sergio Osmena were elected President and Vice President, respectively, and obtained a large majority of seats in the National Assembly. The vote for President was: Quezon, 695,332; Gen Emilio Aguinaldo, Nationalist, 179,349; Bishop Gregorio Aglipay, Republican and head of the independent Philippines Catholic Church, 148,010. Mr. Quezon stood for full acceptance of the Tydings-McDuffie Act and promised to follow the precedents set by successive American Governor Generals in administering the office of President. The opposing candidates both demanded immediate independence. The vote for Vice President was: Osmena, 812,352; Raymundo Melliza, Nationalist, 70,889; Norberto Nabong, Republican, 51,433.

The stage was now set for the establishment of the Commonwealth. At the invitation of the Philippine Government 17 United States Senators and 26 Representatives, headed by Vice President John N. Garner and Speaker Joseph W. Byrns, journeyed to Manila for the inauguration ceremonies. Secretary of War George H. Dern, numerous other functionaries, and about 35 newspaper editors from the United States were also guests of the Island Government. The impressive ceremonies in Manila on November 15 attending the swearing in of Mr. Quezon as President were attended by nearly a quarter of a million people. Almost simultaneously with the inauguration ceremonies a proclamation certifying the freedom of the Islands and the election of the officials chosen on September 17 was signed by President Roosevelt in Washington (the signing took place November 14 due to a difference of 13 hours in time between Washington and Manila). The proclamation was then read by Secretary of War Dern to the assembled multitude in Manila. At the same time Frank Murphy, the former Governor General, assumed the new office of United States High Commissioner to the Philippine Commonwealth.

The Constitution. The new Constitution vested most of the executive powers formerly exercised by the Governor General in a President elected for six years by popular vote and ineligible for reelection. Legislative power rested with a unicameral legislature (National Assembly) of 98 members, also chosen by popular vote. The suffrage, however, was restricted to literate male

citizens having certain residence qualifications. All other elements of the government, including the Supreme Court of the Islands, were reconstituted under the Constitution, or laws enacted pursuant thereto. The natural resources of the Islands are declared property of the state and their exploitation was restricted to Philippine citizens or to corporations or associations in which citizens owned at least 60 per cent of the capital. Subject to existing rights, the National Assembly was authorized to determine the size of agricultural holdings.

While the Independence Act and the Constitution of the Philippines greatly broadened the Islands' autonomous powers, they reserved to the United States the control of defense and foreign relations, supervision over important phases of finance, and the right to intervene to preserve the Commonwealth government, to protect life, property, and individual liberty, and "for the discharge of government obligations under and in accordance with the provisions of the Constitution." During the ten-year transitional period, all Philippine officials were required to take an oath of allegiance to the United States; United States Government property was made exempt from taxation; the American Congress was empowered to limit the amount of the Philippine public debt; and no foreign loan might be contracted without Washington's approval. Moreover the American President was authorized to veto any Philippine law or executive order which, in his judgment, disregarded the Philippine Commonwealth's contracts or violated international obligations of the United States.

Appeals from decisions of Philippine courts might be carried to the United States Supreme Court; the Philippine President was required to report annually to the American President and Congress on the condition of the Commonwealth; and American citizens retained equal rights with Philippine citizens, although citizens of the Islands were considered foreigners in the United States and their entrance restricted under the quota system. Similarly, the exports of the United States were to be admitted free of duty into the Philippines for the ten-year period but Philippine exports, 84 per cent of which were shipped to the United States in 1934, were to be progressively barred by the gradual increase in tariff rates.

Problems of the Commonwealth. The disastrous economic dislocation threatened by the progressive exclusion of Philippine products from the American market was the most pressing of the several serious problems which beset the new Commonwealth. An American-Philippine reciprocal trade conference to discuss this problem was scheduled for early in 1936. Meanwhile the Island Government had organized an economic planning board to study proposals for making the Philippines less dependent upon the American market. The production of new raw materials for export and to serve as a base for new domestic manufacturing industries was investigated.

The other chief problems were the maintenance of internal order and the preservation of Philippine independence in the face of the rapidly expanding Japanese empire. The first of these dangers was emphasized by a serious armed uprising of the radical Sakdalists which broke out on May 2 and 3 in advance of the plebiscite of May 14. Simultaneous risings occurred at various points in the Provinces of Bulacan, Rizal, Cavite, and Laguna, the object being to occupy Manila and other cities,

repudiate the new Constitution, declare immediate independence, and establish a semi-socialistic régime. The movement was crushed by the Philippine Constabulary without the aid of United States troops, but only after rather severe fighting in which four members of the constabulary were killed and 10 wounded. The Sakdalists had 56 killed and 69 wounded. More than 1100 arrests followed but about 736 prisoners were subsequently released. By the middle of September 94 persons, including two Sakdal representatives in the Legislature, had been convicted of attempting to overthrow the government, 19 had been acquitted, and 272 were still awaiting trial.

The crushing of this revolt did not allay unrest, which was stirred up constantly by the vigorous propaganda of General Aguinaldo and other foes of the Quezon-Osmena government. Hunger and want in certain provinces produced mob attacks on rice warehouses, an Assemblyman-elect was assassinated by political foes, and a growth of banditry was reported. General Aguinaldo demanded an investigation into alleged government fraud and intimidation in the election of September 17, a request which Governor General Murphy refused. Shortly afterwards Philippine constabulary officers reported the discovery of a Sakdalist plot to seize the Governor General in connection with a coup against the Insular Government. Confirming predictions of a conflict between the Christian Filipinos and Moslem Moros upon the withdrawal of United States sovereignty, the Mohammedan Students' Association of Mindanao and Sulu on December 26 petitioned President Quezon to grant autonomy to those islands.

The seriousness of the problem was indicated by the fact that President Quezon devoted a third of his inaugural address on November 15 to a warning that attempts at rebellion and disorder would be vigorously crushed. Foreseeing difficult times ahead, Mr. Quezon in the summer of 1935 had asked the War Department at Washington to assign Gen. Douglas MacArthur to develop a national defense system for the Islands in preparation for their eventual independence. General MacArthur's appointment was announced the day after Mr. Quezon's election as President. Accompanied by a small staff of American army officers, General MacArthur left Washington shortly afterwards for Manila. In line with plans drafted by the General, the National Assembly on December 14 approved the Philippine National Defense Act, establishing a system of compulsory military training and providing for the mobilization of all Philippine citizens and resources in wartime. The sum of \$8,000,000 was appropriated for military purposes, including the customary \$3,500,000 for the Commonwealth constabulary and \$1,700,000 for military equipment. The Defense Act fixed the size of the Philippine army at 19,000, including 3500 to be used as police; provided for the military training of youths beginning at the age of 10; and envisaged a trained reserve of 500,000 men by 1945. The annual cost was estimated at 16,000,000 pesos, or about 25 per cent of the total budget.

A situation which seemed replete with possibilities of future embroilment with Japan had already developed in Davao Province on the Island of Mindanao. There a Japanese colony variously estimated at from 13,000 to 25,000 had over a period of years established profitable and successful agricultural colonies in a virtual wilderness won at the cost of much hardship and the loss of some

2000 Japanese killed by wild tribesmen. Controlling some 126,000 acres, devoted principally to hemp, and with an investment representing from \$10,000,000 to \$25,000,000, the Davao colony was engaged in a controversy with Philippine officials as to the legality of the leases to about 65,000 acres. Wholesale cancellation of these leases was urged by some Filipino leaders, while others suggested the outright purchase of all Japanese interests in Davao to avoid inevitable friction with the Tokyo government.

These ominous domestic and foreign dangers led conservatives in the Islands, including both business men and political leaders, increasingly to question the desirability of complete independence. On December 10 Roy W. Howard, chairman of the board of the powerful Scripps-Howard newspaper chain in the United States, brought this discussion into the open by issuing a statement in Manila in which he urged that the Commonwealth form of government be made permanent, with the United States retaining its sovereignty over the Islands. He said that such a policy was in line with "a consensus of opinion gathered during the past month from scores of leaders in business, finance, education, journalism, and politics." "The security of liberties already achieved, rather than national independence, has become the major political objective," he asserted, attributing the change to the "dark shadow" cast across the Philippines by an armed and aggressive Japan. It was generally believed that the statement was issued with the approval of President Quezon, with whom Mr. Howard had just completed a boat tour of the southern islands.

Meanwhile the steady replacement of United States cotton goods in the Philippine market by cheaper Japanese products was checked by an American-Japanese agreement concluded on October 12 without the participation of the Insular Government. Japan agreed to restrict her exports of cotton piece goods to the Islands to 45,000,000 square meters annually.

Legislation. Measures passing the American Congress during 1935 which affected the Philippines included an amendment to the Independence Act increasing the amount of duty-free cordage that might enter the United States annually from the Islands from 3,000,000 to 6,000,000 lb.; a law levying a processing tax of 1 cent per pound on rice, effective Apr. 1, 1935, to July 31, 1936; and an act providing for the return to the Islands at the expense of the United States Government of unemployed Filipinos in the United States who applied for transportation to their homeland.

The Insular Legislature held two special sessions during 1935—one on April 8-10 to fix the date of the Commonwealth election and to provide for the submission of the new Constitution to the voters, and the second on June 12 to canvass the return of the plebiscite of May 14. The regular session convened on June 24 and recessed on July 18 to September 23, after passing an appropriation act and a public works bill.

Consult Grayson L. Kirk, "Whither the Philippines," *Current History*, November, 1935.

PHILLIPS UNIVERSITY. A coeducational institution of higher learning at University Station, Enid, Okla., founded in 1907. The enrollment for the autumn of 1935 in all departments was 635. The attendance at the 1935 summer session was 219. The faculty numbered 32. The productive endowment amounted to \$643,554. The income for the year was \$96,230. The library contained 23,183 volumes, ex-

clusive of public documents. President, Isaac Newton McCash, D.D., LL.D.

PHILOLOGY, CLASSICAL. The best way to gain a fair conception of the more important contributions to classical philology is to examine lists of articles, books, reviews, or abstracts of them, or both, given in certain periodicals—*The American Historical Review*, *The American Journal of Philology*, *Antiquity*, *The Classical Journal*, *Classical Philology*, *The Classical Quarterly*, *The Classical Review*, *The Classical Weekly*, *Language* (the organ of the Linguistic Society of America), *Speculum* (the organ of The Mediaeval Academy of America), *History*, *Athenaeum* (published at Pavia, Italy), *The Journal of Hellenic Studies*, *The Journal of Roman Studies*, *Rivista di Filologia Classica*, *L'Antiquité Classique* (this replaces *Le Musée Belge*), *Mnemossyne*, *Philologische Wochenschrift*, *Gnomon*, and *Revue de Philologie*.

In addition to the periodicals listed above may be named certain monographs that appear with a fair degree of regularity. Especially valuable is *Bibliotheca Philologica Classica*, *Beiblatt zum Jahresbericht über die Fortschritte der Klassischen Altertumswissenschaft*, whose aim is to cover all publications, both articles and books (except such as are definitely pedagogical in character), in the whole field of classical philology. No attempt is made, however, to indicate the relative importance of the items listed.

In France a work of like value is published under the title *L'Année Philologique et Analytique de l'Antiquité*.

The Year's Work in Classical Studies, published in England, lists material that appears between July 1 and June 30, under such captions as "Greek Literature," "Latin Literature," "Greek History," "Roman History," "Greek and Roman Religion," "Ancient Philosophy," "Greek Archaeology and Excavation," "Italian Archaeology and Excavation," "Papyri," and "Roman Britain."

To *The Loeb Classical Library* (see *YEAR BOOKS*, 1911-34), additions were made, on the Greek side, of versions of Aristotle, *Athenian Constitution*, *Eudemian Ethics*, *Vices and Virtues*, H. Rackham; Aristotle, *Metaphysics*, *Books x-xv*, *Oeconomica*, and *Magna Moralia*, H. Tredennick and G. C. Armstrong; Aristotle, *On the Soul*, *Parva Naturalia*, *On Breath*, W. S. Hett; Demosthenes, *Meidias*, *Androtion*, *Aristocrates*, *Timocrates*, *Aristogiton*, J. H. Vince; Pausanias, Vols. iv and v, W. H. S. Jones (the concluding volumes. Vol. iv completes the translation; vol. v, compiled by R. E. Wycherley, consists of maps, plans, illustrations, and descriptive matter, and a full index to vols. i-iv); Plato, *Republic*, second and concluding volume, P. Shorey; Philo, the sixth of nine volumes, F. H. Colson; and Sextus Empiricus, vol. ii, R. G. Bury. On the Latin side there were added versions of Celsus, *De Medicina*, the first of two volumes, W. G. Spencer; Cicero, *The Verrine Orations*, the second of two volumes, L. H. G. Greenwood; Livy, vol. ix, covering Books xxxi-xxxiv, E. T. Sage; Livy, vol. x, covering Books xxxv-xxxvii, E. T. Sage; Procopius, *History of the Wars*, vol. vi, H. B. Dewing; and *Remains of Old Latin*, the first of three volumes, E. H. Warmington (this volume gives translations of the fragments of Ennius and Caecilius).

During the year progress was made on several lexicographical projects of the very highest importance. Of the tenth edition of Liddell and Scott, *A Greek-English Lexicon*, the eighth of the 10

parts was published; the Lexicon has been carried well into the letter Sigma; 1600 pages have now been issued. Of the *Thesaurus Linguae Latinae* the first two fascicles of vol. vii appeared: these covered *i-ico*, *ico-ignatus*. Fascicle 5 of vol. v, part 2, also appeared; this covered *eo-erogo*. Of A. Walde, *Lateinisches Etymologisches Wörterbuch*, 3d ed., by J. B. Hofmann, part 8, pages 561-640, *fulmen-hercium*, was issued.

Many years ago G. N. Olcott, then a professor at Columbia University, began, single-handed, the publication of *Thesaurus Linguae Latinae Epigraphicae*. After 22 fascicles, consisting of 520 pages, and covering *A—Asturia* had appeared, the work was cut short by the death of Professor Olcott. The work has been resumed, by L. F. Smith, J. H. McLean, and C. W. Keyes. In 1935, two parts, 48 pages, covering *Asturica—Augur* were published. These count as fascicles 1 and 2 of vol. ii.

In *The American Journal of Philology*, lvii, appeared "New Light on the Classical Scholarship of Thomas Gray," L. Van Hook; "Modal Uses in Chariton," W. S. Blake; "Presuppositions in Aristotle's Physics," G. Boaz; "On Certain Mathematical Terms in Aristotle's Logic," B. Einarsson; "Foreshadowing and Suspense in the *Posthomeric* of Quintus of Smyrna," G. E. Duckworth; "Discovery of the Minor Works of Tacitus," C. W. Mendell; "Place Names and Heroes in the *Aeneid*," Louise Adams Holland; "Critical Notes: Seneca's *Dialogi* VII-XII," W. H. Alexander; "The Date and Nature of the *Lex Thoria*," E. F. D'Arms; "Julia Berenice," Grace H. Maccurdy; "Early Ionian Writing," R. Carpenter; "Catiline, Crassus, and Caesar," E. T. Salmon; "Some Details of the Athenian Constitution," B. D. Meritt; "The Financial Crisis of 33 A.D.," T. Frank; "Inscriptions of Colophon," B. D. Meritt.

In *Classical Philology*, xxx, appeared "A New Dating of Horace's *De Arte Poetica*," J. Elmore (the author would put the writing of this treatise in 28-27 B.C.; other scholars have suggested 20, 15, or even 8 B.C. as the date); "Rome's Battles with Etruscans and Gauls in 284-282 B.C.," E. T. Salmon; "The Place of the Dog in Superstition as Revealed in Latin Literature," E. E. Burris; "The Development of Plautus' Art," J. N. Hough; "Wayfaring Signs," E. S. McCartney (this is a discussion of signs the wayfarer encounters, from meeting quadrupeds, from meeting snakes, from meeting birds, etc., that will show him whether good or evil is to be his portion); "Utopian Sources in Herodotus," M. Hadas; "Four Private Letters from the Columbia Papyri," C. W. Keyes; "On the Plot of Menander's *Dyscolus*," R. A. Pack; "Was Greece Free Between 196 and 146 B.C.?", J. A. O. Larsen; "The Art of Formula in Homer," G. M. Calhoun; "The Structure of the *Miles Gloriosus*," G. E. Duckworth; "The Origin and Meaning of the Term 'Uncial,'" W. H. P. Hatch; "Catullan Echoes in the *Odes* of Horace," C. W. Mendell; "Scrutiny and Appeal in Athenian Citizenship," A. Diller; "Ἐμπόρος, Ναύκληρος, and Κάπηλος: A Prolegomena to the Study of Athenian Trade," M. I. Finkelstein.

In *The Classical Journal*, xxx-xxxi, the following articles appeared: "The Wit's Progress—A Study in the Life of Cicero," H. Bennett; "Cicero's Tusculan Villa," G. McCracken; "Unwritten and Lost Epics of the Augustan Poets," T. W. Dickson; "The Development of Historiography Among the Romans," Marion Dittman; "Cicero and Mod-

ern Politics," B. L. Ullman; "Comments on Vergil's *Aeneid*," T. Frank; "The Jacob's Ladder in Homer," R. T. Stephenson (this is a study of the "concrete pictures" presented by Homer "of co-operation between God and man. . ."); "Claudian and the *Pervigilium Veneris*," Gladys Martin; "Lucretius and *The Testament of Beauty*," H. C. Lipscomb; "Horace as an Occasional Poet," L. E. Lord; "Horace's Definition of Poetry," T. Frank; "Aeolian Strains on the Roman Lyre," Cornelia C. Coulter.

In *The Classical Weekly*, xxviii, xxix, were published "Some American Estimates of Horace," J. P. Pritchard; "Religious Gleanings from the Magical Papyri," E. Riess; "Some Epicureans at Rome," C. M. Hall; "The Stoic Creed on the Origin of Kingship and of Laws," A. M. Young; "Thucydides I. 27.1," F. C. Babbitt; "A Study of Dramatic Technique as a Means of Appreciating the Originality of Terence," P. W. Harsh; "Excavations on the Site of the Ancient Town of Alesia," G. H. Allen; "Vergil, The Lord of Language," G. B. Beach; "The Trend of Euripidean Criticism," H. E. Mierow; "Un-Hellenic Elements in the Subject Matter of the *Dionysiaca* of Nonnus," L. R. Lind; "In Roman Egypt," Ethel H. Brewster (a study of a certain Tryphon, a weaver); "The Technique of Emotional Appeal in Cicero's Judicial Speeches," H. J. Leon; "Hawthorne's Debt to Classical Literary Criticism," J. P. Pritchard; "Seneca's Appearance," H. W. Kamp; "George Grote and His History of Greece," T. B. Jones.

In *Transactions and Proceedings of the American Philological Association*, lxxv, which gives the papers read at the meeting of the Association held in December, 1934, one finds the following papers: "Spirit and Plan of the *Pervigilium Veneris*," E. K. Rand; "Menander in Current Criticism," L. A. Post; "A New Indirect Tradition for the Text of Valerius Maximus," Dorothy Schullian; "The *Ἀμυρία* of Achilles," S. E. Bassett; "A Problem of Authenticity," G. M. Calhoun (a protest against the prevailing tendency to regard Demosthenes, Oratio 29, as not the work of the great orator); "The Hippocratic Patient and His Physician," H. N. Couch; "The Position of the Parabasis in the Plays of Aristophanes," P. W. Harsh; "Roman Landholding in Asia Minor," T. R. S. Broughton; "Cicero in *Catilinam* 1, 19—Catiline's Attempt to Place Himself in *Libera Custodia*," W. E. Gwatkin, Jr.; "The Evidence for the Teaching of Socrates," E. R. Havelock.

In England two classical periodicals are especially well known—*The Classical Quarterly* and *The Classical Review*. In *The Classical Quarterly*, xxix, appeared "The Later Greek Comic Chorus," K. J. Maidment; "Aeschylus *Agamemnon* 1223-38 and Treacherous Monsters," A. Y. Campbell; "Terentiana," J. D. Craig; "Notes on the Fifth Idyll of Theocritus," A. S. F. Gow; "Notes on Herodotus," J. E. Powell; "Simonides Fr. 13 Diehl," J. A. Davison; "The Pseudo-Platonic Dialogue *Eryxias*," D. E. Eichholz; "Notes on Three Passages from the Nicomachean Ethics, Book VIII," G. Percival; "The Comic Fragments in Their Relation to the Structure of Old Attic Comedy," M. Whittaker.

There remains only space to mention a very few of the books that have come to hand:

Atkins, J. W. H., *Literary Criticism in Antiquity*; Bailey, C., *Religion in Antiquity*; Bailey, C., *Religion in Virgil*; Baldston, J. P. V. D., *The Emperor Gaius (=Caligula)*; Baker, G. P., *Twelve*

Centuries of Rome; Baxter, J. H., and Johnson, Charles, *Medieval Latin Word-List from British and Irish Sources*; Butler, H. E., *The Fourth Book of Virgil's Aeneid*; Glover, T. R., *The Ancient World*; Griffith, G. T., *The Mercenaries of the Greek World*; Guthrie, W. H., *Orpheus and Greek Religion*; Hadszits, G. D., *Lucretius and His Influence*; Hutton, James, *The Greek Anthology in Italy to the Year 1800*.

Kappelmacher, A., and Schuster, M., *Die Literatur der Römer bis zur Karolingerzeit*; Livingstone, R. W., *Greek Ideals and Modern Life*; Marsh, F. B., *A History of the Roman World from 146 to 30 B.C.*; Morrow, G. R., *Studies in the Platonic Epistles, With a Translation and Notes*; Oldfather, W. A., Canter, H. V., and Perry, B. E., *Index Apuleianus*; Parker, H. M. D., *A History of the Roman World From A.D. 138 to 337*; Pease, A. S., *Publi Vergili Maronis Aeneidos Liber Quartus*.

Richards, G. C., *Cicero: The Fall of a Republic*; Rose, J. H., *The Mediterranean in the Ancient World*, 2d ed.; Scullard, H. H., *A History of the Roman World 753 to 146 B.C.*; Showerman, G., *Monuments and Men of Ancient Rome*; Sinclair, T. A., *A History of Classical Greek Literature from Homer to Aristotle*; Spicer, E. E., *Aristotle's Conception of the Soul*; Stobart, J. C., *The Glory That Was Greece*, and *The Grandeur That Was Rome* (these are revised editions, by F. N. Pryce); Tozer, H. T., *History of Ancient Geography, Second Edition, With Additional Notes by M. Cary*; West, L., *Roman Gaul: The Objects of Trade*; Westlake, H. D., *Thessaly in the Fourth Century B.C.*

PHILOLOGY, MODERN. The French Academy celebrated with much pomp and ceremony its tercentenary during the summer and, as a sort of culmination of its "glorious" achievements, completed on Sept. 5, 1935, the long-heralded eighth edition of its Dictionary of the French Language, after having worked on it since Nov. 5, 1885, or lacking just two months of fifty years. This Dictionary is, as is well known, the authoritative conservative-lexicon of the language, for the Academy, at its weekly meetings, has discussed with the utmost care and circumspection every word that has made a bid for its consideration and has examined thoroughly all of its claims of being included among the aristocrats of linguistics. It is true that there are no lexicographers or grammarians in the Academy—unless Abel Hermant, author of an unimportant grammar of popular French speech, may be dignified with such a title—but little difference does that make to the august self-appointed arbiters of vocabulary and usage! This fascism of speech is not, however, one of the many mushrooms of modern Europe, but goes back three centuries to a really great exponent of that doctrine, Cardinal Richelieu.

When the Academy was founded by the Cardinal on Mar. 13, 1634, it had no definite aim or purpose. Consequently, its first meetings consisted of lectures and verbose orations on a great variety of irrelevant subjects. Chapelain inveighed, for example, against love (*Contre l'Amour*), while Racan thundered against science (*Contre les Sciences*), and Gombaud, not to be outdone, took for the subject of his discourse, the *je ne sais quoi*. All of which so exasperated Richelieu, who said he had expected something better of "ces Messieurs," that he ordered them to "meddle with nothing but the embellishment and improvement of the French language." This proved to be a very

happy edict, since the Academicians were anything but pleased with the fact that, while they were indulging in empty words, the women of the salons of Mme de Rambouillet, Mlle de Scudéry and others had, unostentatiously, but firmly, established themselves as the directors of the language. Taking advantage of this glorious opportunity to reassert the rights of males, the Academy then began to devote its weekly meetings to discussions and criticisms of the works of its members in order to draw therefrom rules for the use of words, and set for its goal the preparation of a grammar and a dictionary. It required almost three centuries to produce the grammar, and when it finally appeared in 1933, under the editorship of the novelist, Abel Hermant, the poet, Paul Valéry, and the medievalist, Joseph Bédier—not one of whom could be called a "grammairien" in the strict philological meaning of the term—it met with an onslaught of devastating criticism at the hands of that prince of historical grammarians, Dean Ferdinand Brunot of the University of Paris, who, of course, was not a member of the Academy.

The Dictionary, on the other hand, was first planned by a pretentious poet, Jean Chapelain (1595–1674), with the counsel of the famous "greffier de l'usage," Claude Favre de Vaugelas (1585–1650), who wrote the widely known *Remarques sur la Langue française* (1647) not only to serve as a guide for the Academicians in their literary work, but also in order to clean the language of its filth (*pour la nettoyer des ordures qu'elle avait contractées*). Chapelain, of course, knew next to nothing of lexicography, and, as for Vaugelas, he himself admitted that he was neither a grammarian nor a lexicographer, for his sole aim was to note down the idioms that he heard every day (*rapporter les locutions qu'il entendait chaque jour*). In fact, the only real lexicographer in the *fauteuils* of the Academy in the 17th century was Antoine Furetière (1620–88), who, as was to be expected, did not approve of the methods adopted by the Venerable Company and set about preparing a *Dictionnaire* of his own, which, unfortunately, was only published two years after his death. Jealous, however, of the success with which he was carrying on his work, the Academy expelled him most unjustly as a plagiarist, hoping thereby to save its face.

It was then in 1694—just 60 years after the first meeting of the Academy—that the first edition of the *Dictionnaire de l'Académie* appeared. Therein was urged the elimination of archaic words (*les vieux mots*), of neologisms (*mots nouvellement inventés*), and of angry and immodest words (*termes d'emportement et qui blessent la pudeur*). This Dictionary, which may be called aristocratic and affected (*précieux*), aimed to make the language gain in dignity and precision, but, at the same time, impoverished it by dropping its picturesque and forceful elements. It was only in its fourth edition (1762) that the "language of the people" as well as a few words taken from the "arts and sciences" were deemed worthy of serious consideration. Hence, it is impossible to get any definite idea of the real status of the language at any given period from the lexicon of the Academy.

In the subsequent six editions, issued in 1718, 1740, 1762, 1798, 1835, and 1878, the last word is *sut*, defined as "a familiar interjection to send people to the devil." In the present (1935) edition, however, the Academicians thought they were making a startling innovation by adding the word *zygomatique*, without realizing that it has long

been current not only in French but even in English. To the Librarian of the Institut, Jean Longnon, has been entrusted the preparation of the new edition for the press; and it is expected that it will appear in 1936 or 1937 at the latest. Impressed, no doubt, by the celebrated *Remarques* of F. Brunot on the Academy's Grammar mentioned above, Marcel Prévost, the novelist, hastened to publish in *Gringoire* (September 13) a defense of the Dictionary, in which he calls attention to his article on the same subject in *Trois Siècles de l'Académie française, par les Quarante*, issued last summer in commemoration of the tercentenary.

Since the first alphabetical letters of this eighth edition were completed back in the 1880's and 1890's, it is not exaggerating to say that the work itself, though not yet published, is already completely out of date. This is due to the absurd procedure of allowing 40 uninterested dilettantes decide arbitrarily, in casual conversation, what words were to be admitted into its columns. How much better it would have been for the Academy to have devoted a part of its enormous funds to the employment of experts who might have completed the work in a few years and, thus, have given us a definite picture of the actual state of the language during one decade or less! The fact that Harrap followed this method explains the anomaly that the most complete dictionary of modern French that has yet appeared has been produced, not in France, but in England.

Furthermore, it is well known that, during the past 40 years, the vocabulary of every European language has undergone greater transformation than in any two hundred years previous thereto. Granting, then, that the Academy definitely excludes from its lexicon all very technical terms, there is, nevertheless, an extensive list of words pertaining not only to science but also to the automobile, cinema, aviation, radio, etc., which have passed into common use. In addition, there are a number of homely locutions, such as *Qu'est-ce que c'est que ça?*—which, because of its ungrammatical character, was once vigorously condemned by both the poet, Victor Hugo, and the great lexicographer, Littré—that can no longer be frowned upon by purists.

If, on the other hand, we consider pronunciation, we note, during this time, changes of equal importance. Thus, in the 1880's, the *ll* in *filles*, *meilleur*, etc., was sounded as *ly* and not *y* as today (Littré, for instance, says: "*flye*, incorrectly pronounced *fiye*"); the *au* in *mauvais* was pronounced like *ô* and not, as now, with the open *o* or, better, the mute *e* (*a*) sound; *femme* was not yet pronounced as *fam*; *fosse* had not yet acquired the long *ô*; the nasal *-on* was not so sharp, having still a slight *g* tinge at the end; etc. And a still more striking innovation may be seen in the introduction of the uvular *r*. The writer of these lines well remembers how, in 1903, the one young actor in the large troupe of the Comédie-Française who used this *r* was berated by critics for not following the example of his elders who rolled out the lingual *r* with such vigor that the very rafters of the auditorium trembled with emotion. And yet, some 10 years ago, the same spectator was astonished to note that the entire troupe was using the much-despised uvular *r*, even including Albert Lambert, fils, who was regarded as the expert manipulator of the lingual *r* some 20 years before.

During the post-War period French also felt the influence of various foreign languages,—especially English,—both in vocabulary and syntax.

Indeed, the phraseology of contemporaneous French novelists is so strikingly different from that of their pre-War brethren as to be almost uncomparable; and, as for the words they use, suffice it to say that very few of them can be found in the last authoritative dictionary of the language, the Hatzfeld-Darmesteter-Thomas *Dictionnaire général de la Langue française*, issued around the beginning of our century.

It should not, of course, be concluded from the above that French was the only language to undergo such transformations since the close of the last century, for it is self-evident that other languages have followed the same course. Thus, in English we have only to compare a present-day dictionary with one of the 1890's to note the vast difference in vocabulary and usage, as well as to consider the rapid development of the stress-accent in England; in Swedish, the gradual passing of the stress-accent into a musical or pitch accent; and in Danish the replacement of initial sonants by surds. As for Spanish, many of the South American tongues have gone so far astray from the mother-speech of Spain as to be at times quite incomprehensible to the Castilian. Thus, Argentinian, with its vast number of borrowings from Italian and with its pronunciation of *jo* for *yo*, *caje* for *calle*, *Irigojen* for *Irigoyen*, etc., is almost becoming a new language. And the Portuguese and the Brazilians now find it necessary to create special dictionaries of equivalents in order to understand one another. Finally, even Castilian Spanish, one of the most conservative tongues in the world, has joined the procession and has been evolving rapidly during the past quarter-century, both as regards vocabulary and pronunciation. In two visits to Madrid, made in 1904 and 1921, the present writer noted the following changes in pronunciation alone: The gradual replacement of what might be called the lisped *c* (surd or voiceless *th*) by the sibilant or surd *s* sound; the total disappearance of the *d* (pronounced formerly as sonant or voiced *th*) between vowels, as in *cansado*, *pescado*, etc.; the aspiration of *s* before a consonant, as in *mismo* (pron. *mihmo*), *los rios* (pron. *loh*), *Escorial* (pron. *Ehcucial*), etc.

All of this is a very healthy sign, showing that modern languages are living and dynamic and are repeating the same processes of growth which have characterized them from the earliest times.

General. G. K. Zipf's *The Psycho-Biology of Language* (Boston), sub-titled "An Introduction to Dynamic Philology," is an interesting attempt to apply statistical principles to objective speech-phenomena, "viewed as but a series of communicative gestures." W. W. Blanck's *General Principles of Language* (ib.) consists of a synthesis of principles common to the study of all languages. A. F. Bentley's *Behavior, Knowledge, Fact* (Bloomington, Ind.), considers linguistic phenomena as events in the behavioral field, as the functional activity of social men. C. Seeger's "Preface to All Linguistic Treatment of Music" is the title of a contribution to *Music Vanguard* (March-April). Col. J. Churchward's *Cosmic Forces as Taught in Mu* (vol. ii; Mount Vernon, N. Y.) is the fifth of his series of volumes dealing with the Lost Continent of Mu. J. E. Pomfret's *The Geographic Pattern of Mankind* (New York) traces the influence of geographical factors on the human race. Other works include H. Hirt, *Indogermanische Grammatik* (Teil VI, Syntax I; Heidelberg), dealing with case and verbal forms of the Indo-European; A. Meillet, *Introduction à l'Étude comparative des Langues indo-*

européennes (7th ed., Paris), a most valuable study; L. Bloomfield, *Language* (London), a British edition of a well-known American work; W. F. Twaddell, *On Defining the Phoneme* (Baltimore), a publication of the Linguistic Society of America; W. B. and E. C. Hunt, *Sixty Alphabets* (Milwaukee, Wis.), a revised and enlarged edition of the authors' typographical study, *Fifty Alphabets*; G. H. Vollins' *Words in the Making* (New York), a volume in the How-and-Why Series; and S. S. Smith, *The Command of Words* (ib.), explaining how to develop a wide vocabulary.

Dictionaries. "The best dictionaries," wisely remarks *John o' London's Weekly*, "are compiled for those who know a good deal about words, not for those who know little. They provide data on which educated readers can form decisions for themselves." Consequently, under this heading we shall attempt merely to list a few titles that will be of use to American readers. These include H. W. Horwill, *A Dictionary of Modern American Usage* (New York), which endeavors to point out the differences between the speech of the United States and that of England; Webster's *Elementary Dictionary* (ib.), a fourth, revised edition of this lexicon, intended for young people; *The Shorter Oxford English Dictionary* (2 vols., ib.), adapted from the 13-volume *Oxford English Dictionary*; *The Thorndike-Century Junior Dictionary* (Chicago), a school dictionary containing 25,000 words, with definitions adapted to the juvenile experience; C. O. S. Mawson, *Dictionary of Foreign Terms, Found in English and American Writings of Yesterday and Today* (New York), containing more than 10,000 words and phrases from more than 50 languages; Gov. J. G. Pollard, *A Connorary* (ib.), a third edition, revised and enlarged, of this collection of unofficial word-definitions, chiefly humorous; E. H. Thomas, *Chinook* (Portland, Ore.), a history and dictionary of the Northwest Coast trade jargon; and, though one may agree with the *London Fortnightly* when it says that "to make a dictionary of slang is like attempting to catalogue an ocean," mention may nevertheless be made of H. N. Rose, *A Thesaurus of Slang* (New York), now appearing in a revised and corrected edition. Other useful glossaries are W. J. Lewis, *The Language of Cricket* (ib.), containing a vocabulary of cricket terms of the past two centuries; *Mary Thomas's Dictionary of Embroidery Stitches* (ib.), with illustrated instructions for making 305 stitches; W. Longyear, *A Dictionary of Modern Type Faces and Lettering* (ib.), a reference glossary; J. O. Dahl, *Dictionary of 1,001 Menu Terms* (Stamford, Conn.); Alice Easton, *Dictionary of Sea Food* (ib.); W. Ames, *What Shall We Name the Baby?* (New York), giving the origins and meanings of 2500 first names; Helen R. Keller, *The Dictionary of Dates* (2 vols.; ib.), a valuable reference history of every country of the world by dates, which extends from the earliest times to the year 1930 and of which the first volume, devoted to the Old World, is based upon the *English Dictionary of Dates* that brought the record down to 1910; and L. A. Leslie and C. E. Funk, *25,000 Words, Spelled, Divided and Accented* (ib.), a guide to correct spelling and syllabication.

Aryans, Archaeology, and Folklore. On the prehistoric ancestors of the Indo-Europeans we have F. Howell, *Our Aryan Ancestors* (Boston), a history of the Aryan peoples; G. Poisson, *Les Aryens* (Paris); T. Fitzhugh, *Aryan Sacred Voice of Stress: Origin and Genesis of Speech* (Charlottesville, Va.), a study of early phonetics in the

Aryan speech; and Margaret Schlauch, *Who Are the Aryans?* (New York), a study of factors in race prejudice.

Useful studies on archaeology include S. Casson, *Progress of Archaeology* (New York), a round-the-world survey of modern archaeological discovery, giving particular attention to recent additions to archaeological knowledge and to the study of history made as a result of excavations during the last 20 years; *The Annual of the American Schools of Oriental Research* (vol. xiv for 1933-34; Philadelphia), a report of the past year's explorations and excavations in Eastern Palestine, edited by M. Burrows and E. A. Speiser; E. A. Speiser, *Excavations at Tepe Gawra* (vol. i; ib.), a record of some Mesopotamian archaeological excavations; W. F. Bade, *A Manual of Excavation in the Near East* (Berkeley, Calif.), a description of methods of digging and recording of the Tellen-Nasbeh Expedition in Palestine; and G. A. Reisner, *Tomb Development* (New York), a handbook for working archaeologists.

Mythology and folklore are studied in F. C. Bray, *The World of Myths: A Dictionary of Universal Mythology* (New York), a classified and indexed dictionary; S. Thompson, *Motif-Index of Folk-Literature* (vols. iii and iv; Bloomington, Ind.), a classification of narrative elements in folktales, fables, myths, etc.; P. Samtyves, *Corpus du Folklore préhistorique en France et dans les Colonies françaises* (Paris) and *Corpus du Folklore des Eaux en France et dans les Colonies françaises* (ib.); and J. N. Then, *Christmas* (Milwaukee, Wis.), customs and legends of the Christmastide from many nations.

African. The attention of the public the world over is again focused on Africa, not as in the past because its archaeological treasures furnished the key to modern civilization, but because it may, in the future, mark the end of that civilization to which it gave birth, as a consequence of the fierce economic struggles which European nations are carrying on within its borders. Hence, among works of interest dealing with that vast continent we may cite W. Fitzgerald, *Africa* (New York), a social, economic, and political geography of its major regions; L. Middleton, *The Rape of Africa* (ib.), supplying the political and diplomatic background in Europe of the international scramble for territory in Africa since 1877, when Stanley navigated the Congo; V. A. O'Rourke, *The Juristic Status of Egypt and the Sudan* (Baltimore); M. Vieuchange, *Smara: The Forbidden City* (ib.), a diary of the exploration of a city in the Spanish Sahara, translated from the French; E. F. Gautier, *Sahara, the Great Desert* (ib.), a study of the geography and life of the desert, translated from the French; D. Campbell, *Camels Through Libya* (Philadelphia), an account of an expedition from the fringes of the Sahara to the oases of Upper Egypt; G. G. Brown and A. M. B. Hutt, *Anthropology in Action* (New York), an experiment in applying anthropological knowledge to the administration of African tribes, published by the International Institute of African Languages and Cultures; G. Gorer, *African Dances* (ib.), the record of a journey through West Africa, made chiefly in order to study the native dances, which also contains a study of native life, government, religion, and customs; *Arts of West Africa* (ib.), a symposium of the graphic and plastic arts, edited by M. Sadler for the International Institute of African Languages and Cultures; G. Sinclair, *Loose Among Devils* (ib.), adventures on Devil's Island

and in the jungles of West Africa; W. D. Hambly, *Culture Areas of Nigeria* (Chicago), an anthropological survey of this region, published by the Field Museum of Natural History; F. G. Carnochan and H. C. Adamson, *The Empire of the Snakes* (New York), an extraordinary account of a secret cult in the African jungle, which is declared to be true; Ethel A. Aginsky, *A Grammar of the Mende Language* (Philadelphia), a study of the language of Sierra Leone, a British protectorate on the west coast of Africa, published by the Linguistic Society of America; Vivienne de Watteville, *Speak to the Earth* (New York), a story of a woman's five-months' trip alone in the wilds of East Africa; E. J. Yancy, *Historical Lights of Liberia's Yesterday and Today* (Xenia, Ohio), a history of Liberia during the past century; and *The Cambridge History of the British Empire, Vol. VIII, South Africa* (New York), a history of the British Empire in South Africa, edited by J. H. Rose, A. P. Newton, and E. A. Benians. Mussolini's colonial aspirations have, as was to be expected, made of the heretofore unknown Abyssinia or Ethiopia the cynosure of all eyes. Among the works devoted to this country are G. MacCreagh, *The Last of Free Africa* (New York), a second edition of a book, first published in 1928, dealing with the nation and people of Abyssinia; Elizabeth P. MacCallum, *Rivalries in Ethiopia* (ib.), a survey of the facts behind the present crisis; C. S. Coon, *Measuring Ethiopia and Flight into Arabia* (Boston), an anthropologist's experiences in Ethiopia; Maj. H. Darley, *Slaves and Ivory in Abyssinia* (New York), a record of exploration among the Ethiopian slave-raiders; L. Farago, *Abyssinia on the Eve* (ib.), a journalist's impressions of Ethiopia; C. F. Rey, *The Real Abyssinia* (Philadelphia), impressions of the country after a stay of 10 years; M. Griaule, *Burners of Men* (ib.), the experiences of a scientist in Ethiopia, translated from the French; M. Griaule, *Jeux et Divertissements abyssins* (Paris), an account of the games and social life of the Ethiopians; L. M. Nesbitt, *Hell-Hole of Creation* (New York), an account of an expedition into the Abyssinian Danakil; and *Abyssinia and Italy* (ib.), a survey of the dispute. Since readers are often puzzled as to whether the country should be called Abyssinia or Ethiopia, it may be remarked that Sir E. A. Wallis Budge states, in his *History of Ethiopia*, that the latter word comes from the Greek, meaning "land of the burnt-faced men," and that it was applied by early geographers and historians to various unexplored regions of Africa and Asia. Even until late into the 19th century "Ethiopia" continued to appear on maps as a vast region vaguely located in equatorial Africa, while Abyssinia was the name given to the heart of the country now officially known as Ethiopia. The natives prefer Ethiopia, since "Abyssinia" and "Habish" have for them a derogatory connotation, being, for some unknown reason, the equivalent of the English "mongrel" or "outcast." Dr. Richard Gottheil, Professor of Semitic Languages at Columbia University, points out, in the *New York Times* of November 2, that the word "Habish" or "Habash," from which Abyssinia is derived, is Arabic and comes from the Habishat tribe of Semites from the Yemen, in South Arabia, who settled in this plateau region many centuries before Christ. The Gallas, Somalis, Danakils, and other subject peoples of the lowlands are, according to the same authority, racially Hamitic and have a different culture. As for the language of Ethiopia, Dr. John P. Harrington, Ethnologist of the Smithsonian Institution, states, in *The Path-*

finder (October 12), that it is the most conservative of the Semitic languages "in that it has departed the least in its form from the original proto-Semitic," the prehistoric language spoken before 5000 B.C., whose "words are obtained by a comparative study of Hebrew, Syriac, Phœnician, Babylonian, Arabic, and Ethiopian." Ancient Ethiopian was spoken down to 1500 A.D., when it broke up into the modern dialects which yet remain "the most primitive Semitic languages." Thus, the pre-Semitic, as well as the Modern Ethiopian, term for "ox" is *alf*, which even in Biblical Hebrew had become *aalef*; the same is true of the word for "house," *beet*, in the former languages, which has become *beeth* in Biblical and Modern Hebrew. Besides being easy to pronounce and to learn, Ethiopian "is sonorous and is accented mostly on the next to the last syllable." Ethiopia being the oldest Christian country in the world, according to Dr. Harrington, "its literature is from the earliest times rich, consisting of Bible translations, prayer-books, liturgies, etc."

Chinese and Japanese. It is quite possible that, by reason of our unfortunate experience with Europe, the attention of the American people will be centred more and more hereafter in our own hemisphere as well as on the Pacific. Consequently, it behooves us to become better acquainted with the history and culture of the Chinese and Japanese peoples, with whom our contacts will no doubt grow in time. That our interest in these nations is rapidly developing may be seen in the steadily increasing output of works dealing with them. Thus, among the useful contributions relating to China, which appeared during the past year, we may note Mary A. Nourse, *The Four Hundred Million* (Indianapolis, Ind.), a short history of the Chinese; Anna L. Strong, *China's Millions* (New York), an analysis of political and social conditions in that country; W. Martin, *Understand the Chinese* (ib.), supplying aspects of modern China and her government; Lin Yutang, *My Country and My People* (ib.), in which a Chinese gives his views of Chinese civilization, its bases and modern phases; *The Sayings of Confucius* (ib.), a third, revised edition of the translation of L. A. Lyall; Sir Reginald F. Johnston, *Confucianism and Modern China* (ib.), a thorough study by an authority in the field; A. Waley, *The Way and Its Power* (Boston), a study of the Tao Tê Ching and its place in Chinese thought; *Mencius* (New York), a translation of the Chinese scholar's writings, with an introductory biographical sketch, by L. A. Lyall; W. E. Griffis, *China's Story in Myth, Legend and Annals* (Boston), a revised edition of a book first published in 1911, with additional chapters by A. Walworth; *Yen-Foh* (Chicago), a folk-tale translated and adapted from the Chinese by Ethel Eldridge; Bertha Metzger, *Picture Tales from the Chinese* (New York), folk-tales, not found elsewhere, told with freshness and charm; R. W. Clack, *From Bamboo Glade and Lotus Pool* (Atlanta, Ga.), selections from Chinese classical poetry, translated into English; Helen Waddell, *Lyrics from the Chinese* (New York), a new edition; L. C. Goodrich, *The Literary Inquisition of Ch'ien-Lung* (Baltimore, Md.), an excellent study of literary censorship in 18th-century China; Lucy Driscoll and Kenji Toda, *Chinese Calligraphy* (Chicago), an investigation into its symbolism, technique and development; D. Carter, *China Magnificent* (New York), a history of 5000 years of Chinese art; Kuo Hsi, *An Essay on Landscape Painting* (ib.), a translation of the precepts of an 11th-century

Chinese artist; Chao-Mei-Pa, *The Yellow Bell* (Baldwin, Md.), a historical sketch of Chinese music, translated from the French; and Mary B. Hollister, *South China Folk* (New York), containing intimate stories of Chinese home life.

On Japan we have S. L. Gulick, *Toward Understanding Japan* (New York), supplying sketches of American-Japanese relations; O. Tanin and E. Yohan, *Militarism and Fascism in Japan* (ib.), a study of the connection between these forces in contemporary Japan; Sir Charles Eliot, *Japanese Buddhism* (ib.), an account of its organization and development; *Buddha, Truth and Brotherhood* (Santa Barbara, Calif.), a summary of Buddhist scriptures, translated from the Japanese; J. W. T. Mason, *The Meaning of Shinto* (New York), a study of the religion of Japan; Lady Murasaki, *The Tale of Genji* (2 vols.; Boston), a new edition of this 11th-century novel, translated from the Japanese by A. Waley; *The Tourist Library* (3 vols.; ib.), containing Y. Fukukita, *The Tea Cult of Japan*, T. Nogami, *Japanese Noh Plays*, and M. Miyoushi, *Sakura, Japanese Cherry*; S. H. Wainwright, Jr., *Beauty in Japan* (New York), a study of the basic esthetics underlying Japanese life and culture; K. Toda, *Japanese Scroll Painting* (Chicago), a study of this field of Japanese art from the 8th to the 15th century, and its relation to national culture; and A. Priest, *Japanese Costume* (New York), a descriptive and historical sketch of No robes and Buddhist vestments on exhibition at the Metropolitan Museum of Art.

Mongolia, Manchoukuo, and Korea are studied in the following: H. Haslund, *Men and Gods in Mongolia* (New York), more adventures in Mongolia by the author of *Tents in Mongolia*; O. Latimore, *Manchuria, Cradle of Conflict* (ib.), a new edition of a well-known work; G. B. Rea, *The Case for Manchoukuo* (ib.), a presentation of its claims for foreign recognition; and F. S. Miller, *Our Korean Friends* (ib.), a missionary's account of contemporary life in Korea.

Indo-Iranian. The history, language and culture of India are studied in the following: Emma Hawkrige, *Indian Gods and Kings* (Boston), a history of India to the close of the period of the great moguls; K. F. Leidecker, *Sanskrit, Essentials of Grammar and Language* (New York), an excellent manual; W. S. Page, *An Introduction to Colloquial Bengali* (Cambridge, Eng.); *The Little Clay Cart, Attributed to King Shudraka* (New York), a play translated from the Sanskrit by A. W. Ryder and adapted by Agnes Morgan; A. K. Coomaraswamy, *Elements of Buddhist Iconography* (Cambridge, Mass.), a treatise on the symbols employed in Buddhist art; L. S. S. O'Malley, *Popular Hinduism* (New York), a survey of the beliefs and practices of the Indian masses; Dr. R. Mulbagaia, *Popular Practice of Yoga* (Philadelphia), a study of its theory and practice; N. Gangulee, *The Indian Peasant and His Environment* (New York), a sociological and economic investigation; M. L. Darling, *Wisdom and Waste in the Punjab Village* (ib.), giving the economic and social aspects of Indian village life; Katherine Mayo, *The Face of Mother India* (ib.), a history and portrayal of Indian life; and P. Brunton, *A Search in Secret India* (ib.), an account of a journalist's wanderings in the heart of India.

The following title on Tibetan may be mentioned here: *Tibetan Yoga and Secret Doctrines* (New York), the *Seven Books of Wisdom of the Great Path*, as translated into English by the late

Lama Kazi Dawa-Samdup, with introductions and notes by the editor, W. Y. Evans-Wentz.

Iranian or Persian is represented by Y. B. Mirza, *The Young Tentmaker* (Boston), a story of the boyhood of Omar Khayyám; C. H. Rempis, *Omar Chajjam und seine Vierzeiler* (New York), a study of his life and philosophy in German, with a translation of his quatrains from the oldest Persian version into German; *The Rubaiyat of Omar Khayyam* (ib.), being the first and fourth translations by Edward Fitzgerald, with an introduction by George Saintsbury; *The Rubaiyat of Omar Khayyam* (San Francisco, Calif.), paraphrased in 712 English rubia verses by H. B. Lister; S. Cobb, *Security for a Failing World* (Washington, D. C.), a description of the Bahá'i movement; and R. Afnan, *Mysticism and the Bahá'i Revelation* (New York), a study in contrasts, issued by the Bahá'i Publishing Committee.

Slavic. A rather curious fact to note is the steady decline of interest of Americans in Slavic studies during the past few years, notwithstanding the millions of people who speak these languages. Among the useful contributions of the past year are Helmsold, Priest of Bosau, *The Chronicle of the Slavs* (New York), a history of the Slavic-Germanic struggles of the 12th and 13th centuries, translated from the Saxon, with introduction and notes, by F. J. Tschann; E. J. Simmons, *English Literature and Culture in Russia (1553-1640)* (Cambridge, Mass.), a study of the importance of England's influence in Russia; *Catalogue of Books Available in English by Russians and on Russia Published in the United States* (New York), in which only a very few out-of-print volumes are included; T. A. Beresney, *Russian* (ib.), a textbook of the essentials of the language; G. Z. Patrick, *Elementary Russian Reader* (ib.), containing selected short stories, G. Kaus, *Catherine: The Portrait of an Empress* (ib.), a life of Catherine the Great, translated from the German; S. Graham, *Tsar of Freedom* (New Haven, Conn.), the life and reign of Alexander II of Russia; N. Popov, *Outline History of the Communist Party of the Soviet Union* (2 vols., New York); Mary S. Callcott, *Russian Justice* (ib.), an excellent study of the Russian penal system; H. Barbusse, *Stalin: A New World Seen Through the Eyes of One Man* (ib.), a biography, translated from the French; B. Jarrett, *The Emperor Charles IV* (ib.), a biography of the 14th-century King of Bohemia; C. Wilkinson, *Prince Rupert, the Cavalier* (Philadelphia), a biography of the Bohemian Prince, nephew of Charles I; M. Haiman, *The Fall of Poland in Contemporary American Opinion* (Chicago), a collection of 18th-century opinions on the dismemberment of Poland; Olga Husek, *The Czechoslovak Fallacy* (Middletown, Pa.), a protest against the treatment of the Slovaks by the Czechs; *Slovakia's Plea for Autonomy* (ib.), a criticism of the Czechoslovakia Union by "An Autonomist"; *Struggle* (New York), a new edition of anonymous account of terrorism in Yugoslavia, translated from the Yugoslav by L. Adamic; M. Savkovitch, *L'Influence du Réalisme français dans le Roman serbo-croate* (Paris); and *The Daina: An Anthology of Lithuanian Folk-Songs* (Chicago), with a critical study and preface by U. Katzenelenbogen.

Celtic. Two interesting Irish Folk Festivals were held in New York during the year. The first, directed by Eileen Curran on August 24, drew 2000 competitors for 250 contests and more than 4000 spectators, whereas the second, which was

the third annual *Feis* of the United Irish Counties Association, held on October 6, attracted 10,000 persons, including 1470 contestants (386 more than last year). The contests included folk singing and dancing, recitation of selections in Irish, competitions of bagpipe bands, playing of Irish musical instruments, etc. At the great Welsh Eisteddfod, held in Wales during the summer, the bardic crown was won by Gwilym R. Jones, editor of a weekly Welsh paper published in Liverpool. The chaired bard, E. Gwyndaf Evans, who is only 22, is the youngest man whose poetry has ever won the chair at the annual festival. He is a student at the University of Wales and the son of a small farmer. Pre-Celtic and Gaulish are represented by the following: J. Déchelette and R. Grenier, *Manuel d'archéologie préhistorique, celtique et gallo-romaine* (vol. vi; Paris); R. Grenier, *Archéologie gallo-romaine* (part ii, 2 vols.; ib.); A. Blanchet, *Carte archéologique de la Gaule romaine* (part iv; ib.), issued by the Académie des Inscriptions et Belles-Lettres; and M. Honnorat, *La Langue gauloise ressuscitée* (ib.).

Contributions to Irish include: *Heroes of Old Ireland* (New York), a collection of the best of the ancient Irish tales, edited by T. P. Cross and C. H. Slover; F. Shaw, *The Dream of Oengus* (Dublin), a very good edition of the text, with useful notes and a vocabulary; H. A. Carney, *Ireland's Contribution to Law* (Boston), a study of the ancient Brehon laws; L. J. Hopkin-James, *The Celtic Gospels: Their Story and Their Text* (New York), a first edition of the *Book of St. Chad* or *Teilo*, written, according to tradition, by St. Gildas before 720; H. De Blacam, *Gentle Ireland* (Milwaukee, Wis.), an account of the Christian culture in Irish history and modern life; A. M. Skelly, *The Sorrows and Glories of Ireland* (New York), a series of papers on Irish history and culture; R. D. Edwards, *Church and State in Tudor Ireland* (ib.), a history of the penal laws against Irish Catholics, 1534-1603; G. O'Nolan, *The New Era Grammar of Modern Irish* (Dublin), especially good for syntax, prosody, and word-formation; S. MacGiollarnath, *Peadar Chois Fharrige* (ib.), a delightful collection of folk-tales (in which, be it said, Ireland is richer than any country in Europe), all recorded from the same *seanchaigh*; T. O'Crohan, *The Islandman* (New York), reminiscences of the life and folklore of the Great Blasket Island, translated from the Irish by Dr. Flower; R. A. Anderson, *With Horace Plunkett in Ireland* (ib.), personal reminiscences of Sir Horace Plunkett's achievements; N. Mansergh, *The Irish Free State* (ib.), an analysis of its government and politics; W. G. Fay and Catherine Carswell, *The Fays of the Abbey Theatre* (ib.), a record of the founding and development of the Irish National Theatre; *Plays of Modern Ireland* (ib.), a collection of 10 plays selected for the purpose of showing the course which the new drama of Ireland has taken in the past 10 years; *The Collected Plays of W. B. Yeats* (ib.), a companion volume to his *Collected Poems*, including plays from 1892 to 1934; F. MacManus, *Stand and Give Challenge* (ib.), a tale of Donnachta Ruadh, one of the last of the Gaelic poets; and Seumas MacManus, *Bold Blades of Donegal* (ib.), a tale of an Irish lad.

Scotland is represented by T. J. Morrison, *The Cairn* (New York), the story of an ancient Scottish family; Agnes M. Mackenzie, *Robert the Bruce, King of Scots* (ib.), a biography; *The Devil in Scotland* (ib.), four tales of diablerie in

Scotland, including Burns, *Tam o'Shanter*, Scott, *Wandering Willie's Tale*, and Stevenson, *The Tale of Tod Lapraik*; *The Scots Book* (ib.), a miscellany of poems, folklore, prose, and letters about Scotland, compiled by R. M. Douglas; Sir Robert Rait and G. S. Pryde, *Scotland* (ib.), a survey of the country; and G. Blake, *The Heart of Scotland* (ib.), a description of Scotland today.

On Wales, we have B. G. Charles, *Old Norse Relations with Wales* (Cardiff), containing accounts of vestiges of Norse settlements in South Wales as well as the Norse element in the place-names of the Southwest coast; D. G. Jones, *Yr Areithiau Pros* (Caerdydd), a collection of Welsh prose exercises used in the Middle Ages; and L. W. Griffith, *Spring of Youth* (New York), recollections of a boyhood in Wales.

Germanics. Studies on German include Luise Haessler, *Old High German "Biteilen" and "Biskerien"* (Philadelphia), a University of Chicago dissertation, published by the Linguistic Society of America; M. P. Goetz, *The Concept of Nobility in German Didactic Literature of the Thirteenth Century* (Washington, D. C.), a dissertation of the Catholic University of America; E. G. Gudde, *Social Conflicts in Medieval German Poetry* (Berkeley, Calif.); A. Lang, J. Lechner, and M. Schmaus, *Aus der Geisteswelt des Mittelalters* (2 vols.; Munster), a collection of studies on the Middle Ages; J. M. Vincent, *Costume and Conduct in the Laws of Basel, Bern, and Zurich, 1370-1800* (Baltimore), a Johns Hopkins University dissertation; W. Andreas, *Deutschland vor der Reformation* (Stuttgart), an intensive investigation; J. Brodrick, S. J., *St. Peter Canisius* (New York), a biography of the Saint who established the Jesuits in Germany in the 16th century; W. H. Bruford, *Germany in the Eighteenth Century* (ib.), presenting the social background of the literary revival; Goethe, *Faust* (ib.), containing the original German version, with English translation and introduction by F. G. G. Schmidt; Maria dos Santos, *Goethe e as Mulheres* (Coimbra), published by the University of Coimbra; E. H. Zeydel, *Ludwig Tieck, the German Romanticist* (Princeton, N. J.), a study of the first exponent of the German Romantic movement; and A. E. Beau, *Rainer Maria Rilke e as Cartas de Sôror Mariana* (Coimbra), another study issued by the German Institute of the University of Coimbra.

The Scandinavians, as usual, distinguished themselves by publishing high-class scholarly studies, probably the best of the year. Among their chief contributions we may note *Four Icelandic Sagas* (Princeton, N. J.), translated, with introduction, notes and bibliography, by G. Jones; M. Jeffrey, *The Discourse in Seven Icelandic Sagas* (Bryn Mawr, Pa.); *The Earliest Norwegian Laws* (New York), translations of the Gulathing and Frostathing laws of the 12th century, by L. M. Larson; *Old Norse Poems* (ib.), a metric translation, with commentary, of eighteen poems, by L. M. Hollander; T. Knudsen and A. Sommerfelt, *Norsk Riksmålsordbok* (Oslo), a splendid dictionary which has now reached the word, *hånd*; A. Sommerfelt, *Hvordan Sproget Blir Til* (ib.), containing an excellent study; *Norwegian-American Studies and Records* (vol. viii; Northfield, Minn.), a collection of nine papers, issued by the Norwegian-American Historical Association; C. Grimbers, *A History of Sweden* (Rock Island, Ill.), translated and adapted by C. W. Foss; and Selma Lagerlof, *Harvest* (New York), memoirs

and folk-tales of the Värmland, with four public addresses, translated from the Swedish.

Dutch and Frisian are represented by J. Hart, *Picture Tales from Holland* (New York), a collection of folk-tales; J. J. Hof, *Friesische Dialect-geographie* (The Hague), a linguistic atlas; and A. E. H. Swaen, *Engelsch Woordenboek* (Zutphen), an excellent Dutch and English dictionary.

Finnish has become very popular in America during the year, possibly because it is the language of the one European country that considers a signed contract as something more than a scrap of paper. Though it belongs to the Finno-Ugric group of languages and is, therefore, not Germanic, —but rather a close relative of Hungarian—we may nevertheless introduce it here, because of its numerous Teutonic borrowings. For the benefit of learners we may, therefore, mention H. Jensen's excellent manual, *Finnische Grammatik* (Gluckstadt).

English. Since English dictionaries have already been listed under the heading *Dictionaries* above, we shall mention here first a few important titles dealing with the English language: J. S. Armour, *The Genesis and Growth of English* (New York), an outline of philology for students; S. Robertson, *The Development of Modern English* (ib.), supplying its historical background; F. W. Bateson, *English Poetry and the English Language* (ib.), a history of their interrelationship; Mary Serjeantson, *A History of Foreign Words in English* (London) discussing linguistic changes; G. N. Clark, *The Dutch Influence on the English Vocabulary* (New York), being No. 44 of the Society of Pure English Tracts; E. Weekley, *Something About Words* (ib.), a collection of essays on the derivations and uses of words; J. B. Opydycke, *Get It Right!* (ib.), a cyclopedia of correct English usage; A. G. Kennedy, *Current English* (Boston), a study of present-day usages and tendencies; R. Whitcomb, *Talk United States!* (New York), a manual of colorful Americanisms; W. C. Barnes, *Arizona Place-Names* (Tucson), an account of the origins of names, history, and location of Arizona places; R. L. Ramsay, A. W. Read, and Esther G. Leech, *Introduction to a Survey of Missouri Place-Names* (Columbia, Mo.), an account of the method of the work, with a survey of names in Pike County; *Dialect Notes* (vol. vi, part ix; New Haven, Conn.), edited by M. L. Hanley, and including vol. ii, part vii of *Thornton's American Glossary*; C. Brooks, Jr., *The Relation of the Alabama-Georgia Dialect to the Provincial Dialects of Great Britain* (Baton Rouge, La.), a comparative study; and J. Padin, *English in Puerto Rico* (San Juan, P. R.), a study of its use in the Territory today.

Anglo-Saxon and medieval English literature are studied in R. H. Hodgkin, *A History of the Anglo-Saxons* (2 vols.; New York), containing their history from the earliest times to the reign of Alfred the Great; Adeline C. Bartlett, *The Larger Rhetorical Patterns in Anglo-Saxon Poetry* (ib.), a valuable study of definite structural patterns through periods of 5 to 50 verses or even more; *Records of the Templars in England in the 12th Century* (London), edited by B. A. Lees; H. Henel, *Studien zum altenglischen Computus* (Leipzig), a collection of studies; M. D. Lobel, *The Borough of Bury St. Edmund's: A Study in the Government and Development of a Monastic Town* (Oxford); G. A. Plimpton, *The Education of Chaucer* (New York), a study of the background of his period; Chaucer, *The Canterbury Tales* (ib.), translated into modern English

verse by F. E. Hill; *Geoffrey Chaucer's Hymn to the Blessed Virgin* (Milwaukee, Wis.), translated into modern English, with an introduction, by A. M. Townsend; William Langland, *The Vision of Piers Plowman* (New York), a modern English rendering of the 14th-century poem by H. W. Wells; and Charlotte D'Evelyn, *Peter Idley's Instructions to His Son* (ib.), letters of a 15th-century English country-gentleman, published by the Modern Language Association of America.

Contributions to the English Renaissance include R. M. Sargent, *At the Court of Queen Elizabeth: The Life and Lyrics of Sir Edward Dyer* (New York), a critical and biographical study; Marjorie Bowen, *Mary, Queen of Scots: Daughter of Debate* (ib.), a biography; E. A. Tenney, *Thomas Lodge* (Ithaca, N. Y.), a biography of the Elizabethan poet and physician; R. L. Greene, *The Early English Carols* (New York), a collection of carols up to 1550; C. B. Judge, *Specimens of Sixteenth-Century English Handwriting* (Cambridge, Mass.), facsimiles taken from public and private records; L. B. Wright, *Middle-Class Culture in Elizabethan England* (Chapel Hill, N. C.), a study of intellectual life of the period; H. O. White, *Plagiarism and Imitation During the English Renaissance* (Cambridge, Mass.), a study of critical opinion in the 16th and 17th centuries; R. W. Chambers, *Thomas More* (London), a biography; K. O. Myrick, *Sir Philip Sidney as a Literary Craftsman* (Cambridge, Mass.), a new evaluation of the poet; and Janet Spens, *Spenser's Faerie Queene* (New York), an interpretation.

The 17th century is represented by *England's Helicon, 1600, 1614* (2 vols.; Cambridge, Mass.), an anthology of poems by Sidney, Marlowe, Spenser, Raleigh, Drayton, and others, edited by H. F. Rollins; *The New Temple Shakespeare* (23 vols.; New York), a new edition, by Prof. M. R. Ridley, of the *Temple Shakespeare*, first published in 1894; *Shakespeare* (vol. iv; ib.), five plays edited by D. Bush; J. D. Wilson, *What Happens in Hamlet* (ib.), a study of dramatic problems and technique, Caroline F. E. Spurgeon, *Shakespeare's Imagery and What It Tells Us* (ib.), a study of the metaphors and similes used by Shakespeare, E. Fripp, *Shakespeare, Man and Artist* (2 vols.; ib.); A. C. Sprague, *Shakespeare and the Audience* (Cambridge, Mass.), a study of the theatrical background of his day; R. B. Sharpe, *The Real War of the Theatres: Shakespeare's Fellows in Rivalry with the Admiral's Men, 1594-1603* (Boston), a chronological survey of the theatrical events of the period; Hilaire Belloc, *Milton* (Philadelphia), a new interpretation; *The Works of John Milton* (vols. viii, ix, xi, xv, xvi, xvii; New York), six new volumes of the 18-volume Columbia University edition; A. Harbage, *Sir William Davenant, Poet, Venturer, 1606, 1668* (Philadelphia), a critical and biographical study; A. Bryant, *Samuel Pepys: The Years of Peril* (New York), the second volume of the biography, dealing with the period of 1669-83; and M. Summers, *The Playhouse of Pepys* (ib.), a study of English drama from 1660 to 1682.

On the 18th and 19th centuries the following may be noted: D. L. Durling, *Georgic Tradition in English Poetry* (New York), a carefully prepared study on the revival and influence of the classic georgic form of verse in 18th and 19th century poetry; S. H. Monk, *The Sublime: A Study of Critical Theories in XVIIIth Century England* (ib.), an investigation of the esthetics of this period,

issued by the Modern Language Association of America; Winston Churchill, *Marlborough, His Life and Times* (vols. iii and iv; *ib.*), dealing with the period 1702-05; Shane Leslie, *The Script of Jonathan Swift and Other Essays* (Philadelphia), being the Rosenbach Lectures on Bibliography for 1933-34; James Boswell, *The Life of Samuel Johnson* (New York), a one-volume edition, prepared by R. Ingpen, originally published in three volumes 30 years ago; *Correspondence of Thomas Gray, 1734-1771* (3 vols.; *ib.*), edited by the late Paget Toynbee and L. Whibley; S. Gwynn, *Oliver Goldsmith* (*ib.*), a biography; S. Shellabarger, *Lord Chesterfield* (*ib.*), a biography; *The Torrington Diaries of the Hon. John Byng* (vol. ii; *ib.*), a journal of tours in the Midlands, Bedfordshire, and Lincolnshire, 1789-91, edited by C. B. Andrews; and *Early Victorian England* (2 vols.; *ib.*), studies on manners, customs and background of the period, edited by G. M. Young.

General works include E. Legouis and L. Cazamian, *A History of English Literature* (New York), a revised one-volume edition, translated from the French; *The English Drama* (*ib.*), an anthology of 30 plays, 900-1642, edited by E. W. Parks and R. C. Beatty; A. Gardner, *A Handbook of English Medieval Sculpture* (*ib.*); M. D. Anderson, *The Medieval Carver* (*ib.*), a study of English church sculpture of the Middle Ages; and H. C. Hunter, *How England Got Its Merchant Marine, 1066-1766* (*ib.*), a history.

Romance. GENERAL. An indispensable work for all students of modern languages is the excellent *The Year's Work in Modern Language Studies* (vol. v; Oxford), edited by Profs. W. J. Entwistle and L. W. Tancock for the Modern Humanities Research Association. The present volume, which deals with the year ending June 30, 1934, is divided into six sections, *viz.*, 1) Medieval Latin Studies, 2) Romance Languages and Literatures, including Italian, French, Provençal, Catalan, Spanish, Portuguese, Basque, and Rumanian, 3) Germanic Studies, including German and Dutch, 4) Celtic Studies, including Irish and Welsh, 5) Slavonic Studies, limited in this issue to Polish, and 6) Modern Greek Studies.

French. Studies on the French language include E. Lommatsch, *Hundert altfranzösische Sprichwörter des Gemeinen Mannes (Proverbe au Vilain)* (Limburg), a splendidly edited collection issued in honor of the 100th birthday of A. Tobler, May 23, 1935, M. K. Pope, *From Latin to Modern French, With Special Consideration of Anglo-Norman* (Manchester, Eng.); F. Brunot, *Histoire de la Langue française* (vol. viii, Paris), of which part i deals with *Le français dans les divers pays d'Europe* and parts ii and iii, *Le français hors de France au XVIIIe siècle*; E. Huguet, *L'Évolution du Sens des Mots depuis le XVIIe Siècle* (*ib.*); G. and R. Le Bidois, *Syntaxe du Français moderne* (*ib.*); J. Damourette and E. Pichon, *Essai de Grammaire de la Langue française* (vol. iv; *ib.*); A. Moufflet, *Encore le Massacre de la Langue française* (*ib.*); and O. Leroy, *A Dictionary of French Slang* (New York), devoted to both slang and colloquial terms.

Old and Middle French are represented by E. K. Rand and L. W. Jones, *The Earliest Book of Tours* (Cambridge, Mass.), a description of an 8th-century copy of Eugeippius's extracts from St. Augustine; M. Skidmore, *The Moral Traits of Christian and Saracen as Portrayed by the Chansons de Geste* (Colorado Springs, Colo.), a thorough investigation; Ruth Parmly, *The Geographi-*

cal References in the "Chanson de Garin le Loherain" (New York), a valuable study issued by the Institute of French Studies; O. E. Albrecht, *Four Latin Plays of St. Nicholas* (Philadelphia), a study of the sources of the legends, with text from the 12th-century Fleury Play-Book; J. C. Russell and J. P. Heironimus, *The Shorter Latin Poems of Master Henry of Avranches Relating to England* (Cambridge, Mass.), edited with biographical and critical notes; M. Waldman, *Joan of Arc* (New York), a biography; and W. F. Patterson, *Three Centuries of French Poetic Theory* (2 vols.; Ann Arbor, Mich.), a masterly and thorough critical history of the chief Arts of Poetry of France from 1328 to 1630, presented as a doctoral dissertation at Columbia University.

Contributions to the Renaissance and the 17th century include M. Françon, *Les Albums poétiques de Marguerite d'Autriche* (Cambridge, Mass.), a critical study, written in French; *Pierre Gringore's Pageants for the Entry of Mary Tudor into Paris* (Chicago), a description of pageants devised in 1514, edited from an unpublished French MS by C. R. Baskerville; F. Hackett, *Francis the First* (New York), a biography; S. Putnam, *Marguerite of Navarre: First Modern Woman* (*ib.*), an unreliable biography of the great poet and author, who was the sister of Francis I; *Rabelais, Volume I, Gargantua* (*ib.*), a second edition of the translation of W. F. Smith; *Concerning Heretics* (*ib.*), an anonymous tract on religious liberty attributed to Sébastien Castellion and published in 1554, translated into English by R. H. Bainton; H. Wolfe, *Ronsard and French Romantic Poetry* (Oxford), the Zaharoff Lecture for 1934; *The Essays of Michel de Montaigne* (vol. ii; New York), translated by J. Zeitlin; F. Watson, *The Life and Times of Catherine de Medici* (*ib.*), a biography; and L. Mouton, *Epernon of Old France* (*ib.*), a biography of a turbulent 17th-century Duke, translated from the French.

Works on the later periods and general works that deserve mention include the following: C. H. Van Duzer, *Contribution of the Ideologues to French Revolutionary Thought* (Baltimore), a Johns Hopkins dissertation on the background of the French Revolution; A. P. Moore, *The "Genre Poissard" and the French Stage of the 18th Century* (New York), a study of popular dialect in the drama; Margaret S. Libby, *The Attitude of Voltaire to Magic and the Sciences* (*ib.*), revealing the influence of scientific discoveries on Voltaire's thought; C. P. Cambiaire, *Le Rôle de la France dans l'Expansion des États-Unis* (Paris), a valuable study on France's influence in America; D. Saurat, *Modernes* (*ib.*), a comprehensive and critical survey of contemporary literature; and E. Bestaux, *La Poésie de Lionello Fiumi* (*ib.*), a study of the work of a leading poet.

Italian. Contributions to this field include C. Merlo, *Studi glottologici* (Pisa); G. Bottiglioni, *Atlante linguistico-etnografico italiano della Corsica* (vol. i, Cagliari); G. A. Stampa, *Der Dialekt des Bergell, I: Phonetik* (Aarau); C. Tagliavini, *Il Dialetto del Livinallongo* (Bolzano); M. Bartoli, *Questioni linguistiche e diritti nazionali* (Turin); J. A. Symonds, *Renaissance in Italy* (2 vols., New York), a new edition of a classic work; L. D. Einstein, *The Italian Renaissance in England* (*ib.*), the seventh printing of an authoritative study; G. Papini, *Dante vivo* (*ib.*), a biography; May E. Southworth, *A Certain Young Man of Assisi* (San Francisco), a biography of St. Francis; E. C. Richardson, *Materials for a Life of Jacopo da*

Varagine (New York), the first biography in English of this 13th-century "Maker of the Italian Language"; A. Cecchini, *Serafino Aquilano e la Lirica inglese del '500* (Aquila), a study of the widespread influence of this 15th-century poet; E. MacLagan, *Italian Sculpture of the Renaissance* (Cambridge, Mass.), the Charles Eliot Norton Lectures of 1927-28; G. H. Huntley, *Andrea Sansovino* (ib.), a study of the famous forerunner of Raphael and Michelangelo; *Leonardo da Vinci's Notebooks* (New York), a new and revised edition by E. McCurdy; D. L. Finlayson, *Michelangelo, the Man* (ib.), a biography; H. H. Powers, *The Art of Michelangelo* (ib.); J. S. Kennard, *Masks and Marionettes* (ib.), a history of the Commedia dell'Arte and of Italian marionette productions; F. R. Bryson, *The Point of Honor in 16th-Century Italy* (ib.), a publication of the Institute of French Studies; Paolo Giovio, *An Italian Portrait Gallery* (Boston), translated from the *Elogia Doctorum Virorum*, 1557, by Florence A. Gragg; Iris Origo, *Leonardi* (New York), a biography of the poet; S. Barr, *Mazzini: Portrait of an Exile* (ib.), a biography of the nationalist; and P. Frischauer, *Garibaldi: The Man and the Nation* (ib.), a biography.

Provençal. F. M. Ford, *Provence: From Minstrels to the Machine* (Philadelphia), a history and description; R. Altrocchi, *Cansoun de Sant Alexis* (Berkeley, Calif.), an 18th-century version of the legend of the Saint; and C. Brunel, *Bibliographie des Manuscrits littéraires en ancien Provençal* (Paris).

Portuguese. The ancient University of Coimbra continues to be the most active centre of Portuguese studies in the world. Among its publications are the following three contributions by Eva Seifert, *O Legado dos Germanos a Romãna ocidental, Uma Volta pelos Arabismos da Terra ibero-românica, e Germânia Romana*; J. da Providência Costa's excellent *Catálogo de Manuscritos da Biblioteca da Universidade*, Nos. 556-821; E. F. Almujara, S.J., *El Manuscrito 726 de la Biblioteca de la Universidade de Coimbra, o la "Historia de varios Reyes de Castilla"*; K. Sudhoff, *Pedro Hispano ou, melhor, Pedro Lusitano, Professor de Medicina e Filosofia e, finalmente, Papa João XXI*; A. da Rocha Madalal, *Visitação geral do Estado espiritual da Sé de Coimbra, organizada em 1556 pelo Bispo D. João Soares*; H. Hatzfeld, *A Expressão de "O Santo" na Linguagem poética dos Românticos portugueses e catalães, tradução de F. Morais*; H. Meier, *Cartas inéditas de Antero de Quental a Wilhelm Störck*; and J. da Providência Costa, *Dr. J. Mendes dos Remédios* (1867-1932). To these may be added M. S. Kastner, *Cravistas Portuguesas* (Mainz), an important anthology of old Portuguese harpsichord music.

Spanish. Of the few Spanish studies of value the following may be noted: J. Munz, *Maimonides: The Story of His Life and Genius* (Boston), a biography, translated from the German; R. B. Merriman, *Rise of the Spanish Empire in the Old World and the New* (London); W. T. Walsh, *Isabella, the Crusader* (New York), a biography of the Queen; V. Marcu, *The Expulsion of the Jews from Spain* (ib.), a history of the Inquisition; S. de Madariaga, *Don Quixote, An Introductory Essay in Psychology* (ib.); F. P. Casamitjana, *Ramón de la Cruz and der französische Kultur-einfluss im Spanien des XVIII. Jahrhunderts* (Bonn); Baltasar Gracián, *A Truth-telling Manual and the Art of Worldly Wisdom* (Springfield, Ill.), a new translation of this collection of aphorisms from the edition of 1643, by M. Fischer; Ada M. Coe, *Catálogo bibliográfico y crítico de las Comedias anunciadas en los Periódicos de Madrid desde 1661 hasta 1819* (Baltimore); and H. Gressen, *Ibsen and Spain* (Cambridge, Mass.), a comparative study.

Spanish-American. Contributions to this field are very numerous, but only a few titles may be mentioned here. Thus, L. L. Sell, *Pan-American Dictionary and Travel Guide* (New York); *Latin-American Libraries* (Washington, D. C.), compiled by C. E. Babcock; H. G. Doyle, *A Tentative Bibliography of the Belles-Lettres of the Republics of Central America* (Cambridge, Mass.); S. M. Waxman, *A Bibliography of the Belles-Lettres of Venezuela* (ib.); P. A. Means, *The Spanish Main* (New York), its history from 1492 to 1700; J. L. Mitchell, *The Conquest of the Maya* (ib.), the history and culture of these tribes; F. A. Kirkpatrick, *The Spanish Conquistadores* (ib.), an account of their ravages in the 16th century; Cora Walker, *Guatemo: Last of the Aztec Emperors* (ib.), a history of the last days of the Aztec Empire and the invasion of Cortez; P. S. Taylor, *An American-Mexican Frontier* (Chapel Hill, N. C.), a historical and social study of Nueces County, Texas; J. F. Dobie, *Tongues of the Monte* (New York), an account of the people and folklore of Northern Mexico; J. F. Dobie, *Puro Mexicano* (Austin, Texas), Mexican legends, folklore, and songs; J. F. Rippey and J. T. Nelson, *Crusaders of the Jungle* (Chapel Hill, N. C.), an account of the pioneer Catholic padres; Lily de J. Osborne, *Guatemala Textiles* (New Orleans), a study of their symbolism; and J. F. Normano, *Brazil: A Study of Economic Types* (Chapel Hill, N. C.).

Phonetics. Useful contributions include C. E. Parmenter and Hilda Norman, *Suggestions for the Use of Phonograph Records in the Teaching of Italian* (Chicago), reprinted from *Italica*; Constance Davies, *English Pronunciation from the 15th to the 18th Century* (London); J. S. Kenyon, *American Pronunciation* (Ann Arbor, Mich.), a sixth, revised edition; C. E. Parmenter and S. N. Treviño, *The Length of the Sounds of a Middle Westerner* (New York), reprinted from *American Speech*; C. R. Walsh, *The Science and Art of Speech* (ib.), a manual of correct speech habits; and C. S. Bluemel, *Stammering and Allied Disorders* (ib.), containing a new theory as to causes and treatment.

PHILOSOPHY. The circle of Logical Positivists with representatives in Vienna, Prague, and Warsaw appeared to command more attention in 1935 than the other European schools of philosophy. Wherever the influence of this school extended analysis, rather than speculation, was ascendant and logic, symbolism, and theory of science were pursued in preference to bolder and, perhaps, more dangerous, subjects. Social philosophy, especially the theory of the state and of history, also excited a great deal of interest, particularly in Germany, and historical studies seemed less remote and more mindful of the discords and divisions of present-day society.

These various directions of interest were well illustrated in the annual meeting of the American Philosophical Association (Eastern Division) at Johns Hopkins University. Harold A. Larrabee, the first speaker, read a paper on Pareto (whose extensive sociological work, *Mind and Society*, was translated into English this year) in which he maintained that Pareto's claims to impartiality and scientific objectivity are amply contradicted by his

outspoken prejudice and his bitter antipathies, that his theory of history should be called "the temperamental interpretation," and that his system constitutes a philosophy ready-made for Fascism. Richard Kroner of Kiel, the next speaker, defended an Hegelian philosophy of history, maintaining that history is the realization of the Idea of which state and religion are embodiments, and that all wars and conflicts are due to tensions within the Idea, and hence are spiritual and necessary. Morris Cohen protested in the name of liberalism and democracy to the mysticism and reaction implied in this view. Sterling P. Lamprecht's paper asserted the paradox that historical events are both caused and contingent, while James Burnham's essay upheld a variant of the Marxian theory of history.

In a later session devoted to logic Charles A. Baylis rejected Lukasiewicz's argument for the existence of propositions which are neither true nor false, maintaining that it rested on a false assumption. Lukasiewicz had argued that the proposition "I will be in Warsaw at a certain future time" is possible but not necessary and hence neither true nor false. For if this proposition were true, his presence in Warsaw at that time would be necessary, and if false, his presence there would be impossible. But both of these alternatives are excluded by the original admission that his presence there is possible but not necessary. Baylis's rejection of this argument, however, was not a challenge to Lukasiewicz's three-value logic. (See 1932 YEAR BOOK under PHILOSOPHY.) A. Ushenko also attacked a theory of the Logical Positivists, that, namely, sentences about space-time are verbal. Ushenko contended that such assertions are "definite" descriptions, but Rudolf Carnap, the chief spokesman of the Logical Positivists, dissented sharply.

A session devoted to Plato featured four papers of more than usual interest, but the part of the programme which was felt to be most important was the final session in which Rudolf Carnap of the Vienna Circle presented his theory of "Testability and Meaning" and Arthur O. Lovejoy of Johns Hopkins replied with a searching and destructive critique. The main target of this criticism was the Logical Positivist's definition of the meaning of a sentence as the "protocol" sentences expressing the conditions necessary to its verification. Lovejoy pointed out the short-comings of this definition, its failure to recognize time differences and subjective meaning, its inability to escape from solipsism, though scientific verification demands agreement with other minds. In replying to these criticisms it appeared to many present that Carnap unconsciously shifted from exciting paradox to drab methodology and back again. The Presidential Address by James B. Pratt defended the interaction theory of mind and body.

The empirical and logistic programme of the logical positivists has been clarified and elaborated by a number of important books this year. Hans Reichenbach in *Wahrscheinlichkeitslehre* investigates the logical and mathematical foundations of the probability calculus, accepting a form of the frequency theory and making use of the recently developed three-value logic. An interesting feature of the book is the attempt to escape from the difficulty of infinite series of probabilities by the view that propositions asserting probability are themselves only probable.

Philipp Frank, in *Das Ende der Mechanistische Physik*, launches a withering attack upon idealistic and metaphysical inferences from modern physics,

and advocates a logical language which would eliminate such speculation automatically. Rudolf Carnap in *Logische Syntax der Sprache und Philosophie und Logical Syntax* (a set of lectures delivered at London) develops in further detail his doctrines that philosophical clarity can be achieved and pseudo-object sentences avoided if sentences about content are only reduced to formal sentences stating implications, that most traditional philosophical problems, such as the mind-body problem, are meaningless when clearly stated, etc. It is apparent, however, that certain earlier views have been abandoned as, for instance, the Wittgensteinian doctrine of atomic sentences. Josef Schachter's *Prolegomena zu einer kritischen Grammatik*, like Carnap's books, attempts to reduce philosophical problems to details of logical syntax. In England the Cambridge group (G. E. Moore, Wittgenstein, Wisdom, and others) pursues similar methods and philosophy more and more becomes a matter of syntax (see *Proceedings of the Aristotelian Society*, 1934-1935).

The philosophical atmosphere in Germany is utterly different. Instead of modest sense-data, sentences and syntax we find Spirit, Volk, State, Race, Destiny, Führer, Submission to the Will of History as the leading concepts; in place of the empiricism of Hume, the positivism of Mach and Poincaré, and the logicism of Wittgenstein, we find an eager return to the authority of Hegel, Fichte, Treitschke, Gobineau, Chamberlain, etc. Thus Theodor Litt in *Philosophie und Zeitgeist* maintains that philosophy must occupy itself with "the Nordic Man, the German Man, whom we envisage in the familiar *Weltanschauung* of our time" and whom we recognize as the canon by which the validity of that *Weltanschauung* must be tested. Philosophy, Litt maintains, should be partisan and timely, lending itself frankly to national pedagogy. "Objectivity" should be discarded. Arnold Gehlen in *Der Staat und die Philosophie* deplors the decline of philosophy since the Enlightenment but looks forward to its "epochal development under National Socialism." Before the advent of the Third Reich philosophers had no real subject-matter since they regarded the state as an apparatus alterable to suit their purposes and therefore imagined that a great deal of freedom was both possible and desirable. Another mistake was to suppose that State, Race, and Freedom can be understood intellectually.

The National Socialist philosophers seem to agree that the State (which is identical with Volk when embodied in the personality of the Führer and which has the same destiny as Race), since it is self-determining and self-justifying, is not answerable to humanitarian or utilitarian ideals nor, indeed, to any external standard whatsoever; and much space is taken up with condemnation of such ideals as progress, democracy, individual liberty, equality of races, the good of mankind, etc., which are regarded as selfish and un-German. Heinrich Oestereich's book, *Freiheitsidee und Rechtsbegriff in der Philosophie von Johann Gottlieb Fichte*, illustrates this tendency. *Liberté* in Rousseau's sense is ridiculed but Fichte's "higher" and more nebulous, transcendental freedom, the kind of freedom which could obtain under the most absolutistic government, is praised. Friedrich Weidauer, to take another example, maintains that value-judgments may have all the characteristics of scientific propositions including "universal acceptance," and then gives as an example: The Führer is more valuable than his followers, assuming that the good of

the *Volk* is the good. Here is exhibited the characteristic failure to recognize that there are other people besides the German people to whom the *Führer* might not be acceptable, whereas all peoples accept the law of gravitation.

Kurt Schilling's *Der Staat* is a more worthy representative of these philosophical tendencies. The state, like marriage, is described as a union of wills not for some stipulated purpose, but for any purpose which time discloses. The many-sided, determined enmity toward Marxism, communism, and democracy, which explains so much of recent German philosophy, results in attacks upon "materialism" in all its forms. Driesch's *The Overcoming of Materialism* (in German) which begins a new series and Harm's *Idealismus Jahrbuch*, which published its first volume this year, may be taken as examples in point. Doubtless this tendency has a few exceptions. Thus Ferdinand Tönnies in *Geist der Neuzeit*, though he is not consistent about it, accepts historical materialism.

The most important philosophical movement in modern Germany, phenomenology, has been almost silent in the past few years. The phenomenology *Jahrbuch* has not appeared and *Logos* has been transformed into a German culture magazine. One phenomenologist, Nicolai Hartmann, whose ethics is rather Platonic and aristocratic, has remained very active, publishing this year an excellent book, *Zur Grundlegung der Ontologie*. Another good book by the Kantian, Julius Kraft, proves the "impossibility" of *Geisteswissenschaft*, but also seems to undermine the philosophical basis of the third Reich. Ernst Von Aster's *Die Philosophie der Gegenwart* is a splendid review of modern movements in German philosophy but like many of the more creditable works, was published abroad.

If historical materialism is anathema in Germany it is the basis of all philosophy in Russia. Yet within the limits set by Marxism there is still much room for violent disagreements. The chief polemics in the past few years have been directed against the Menshevik Idealists on the one hand and the Mechanists, on the other, representing opposite deviations from Marxism, with Deborin as the principal spokesman of the first, and Bucharin the main sponsor of the second. Orthodox Russian philosophers are now committed to non-mechanistic "leaps" both in nature and in society (as much as are the emergent evolutionists) and have no difficulty in deriving this view from Marx and Engels. Marxian philosophers are more resolute and successful in connecting philosophical theory with social and economic practice than are their opponents, and naturally the question of "leaps" has practical significance. Thus, M. Z. Selektor in *Dialectical Materialism and the Theory of Equilibrium* (a book which should perhaps be translated) argues that Bucharin's doctrine that the productive forces in any society determine the productive relations, but not conversely, led him to the politically disastrous view which he held on the inception of the first Five Year Plan, that socialism could not be developed independently in an economically backward country. Apparently, Bucharin, having seen his errors, on the practical side, has discarded his mechanistic theory. For a general review of Russian philosophical thought in English the reader is referred to *Marxism and Modern Thought*, edited by Bucharin.

In French philosophy, the most interesting book for English readers is perhaps the translation of Henri Bergson's *The Two Sources of Morality and Religion*. Employing his well-known principles

of biologism, mysticism, intuition, and instinct vs. intellect and mechanism, Bergson proceeds to distinguish closed and open societies. In the first "the members hold together caring nothing for the rest of humanity, on the alert for attack or defence." The moral principle in this society is the cohesive force binding its members into a rigid, changeless, solidarity, perpetuated by the "myth-making function" and "static religion." Open societies come about through the action of a few rebels who seek to break the closed society and by their non-conformity and mystical aspiration to lead the way from the City to Humanity. If successful, of course, they are bound to employ symbols and myths and thus to return in a measure to the principle of the closed society and to compromise their mystical, dynamic religion by elements of static ritual. It is an unfortunate consequence of anti-intellectualism that these new aspirations cannot be known by society until it has already adopted them. But the most serious shortcoming of this brilliant book is the entire neglect of economic motives. The representation of history as a conflict of classes, for example, is referred to the dramatic proclivities of historians.

A great many valuable historical books have appeared in France. *La loi de réalisation humaine dans Saint Thomas* by E. Rolland, for example, argues that the supernaturalism in Christian Ethics allows for an endless continuity of moral life, not provided for by opposing systems. The same author's treatment of the problem of God in the philosophy of Leibniz is also worthwhile. Jacques Maritain has also published two books this year: *La Philosophie de la Nature* and in translation, *Freedom in the Modern World*, which expound faithfully, yet with an eye to modern developments, the Thomist philosophy. Thus, the latter concludes that the world has entered a revolutionary period, and he regrets that the preoccupation with a change in the visible world has distracted men from the true revolution which is spiritual. In an appendix the Thomist doctrine of "Person and Property" is applied to modern problems.

A number of valuable Platonic studies have also appeared. Thus Michael B. Foster's *The Political Philosophies of Plato and Hegel* is an ambitious attempt to present two of the greatest political systems in contrast. Harold Cherniss's book, *Aristotle's Criticism of Presocratic Philosophy*, is another of the many contributions to Platonic scholarship appearing during the year. Another book of outstanding importance, *A Documentary History of Primitivism and Related Ideas*, by A. O. Lovejoy and others, traces the history of important ideas through the Greek period. Later volumes will carry the same investigation down to modern times.

Bibliography. Aster, Ernest von, *Die Philosophie der Gegenwart*; Bannes, Joachim, *Platon, Die Philosophie des heroischen Vorbildes*; Blanché, Robert, *Le rationalisme de Whewell*; Bosanquet, Bernard, *Bernard Bosanquet and His Friends*; Bosshart, Emile, *Die Systematischen Grundlagen der Pädagogik* Edward Sprangers; Bucharin, Nicolai (Editor), *Marxism and Modern Thought*; Carnap, Rudolf, *Philosophy and Logical Syntax and Logische Syntax*; Cherniss, Harold, *Aristotle's Criticism of Presocratic Philosophy*; Church, Ralph W., *Hume's Theory of the Understanding*; Draghicesco, D., *Vérité et révélation, Vol. II*; Driesch, Hans, *Die Überwindung des Materialismus*; Ehrlich, Walter, *Grundzüge zur Rechtsmetaphysik*; Foster, Michael B., *The Political Philosophies of Plato and Hegel*; Frank, Phil-

ipp, *Das Ende der mechanistischen Physik*; Gehlen, Arnold, *Der Staat und die Philosophie*; Geroult, M., *Dynamique et métaphysique Leibniziennes*; Gurwitsch, Alexander, *Das Revolutionsproblem in der deutschen staatswissenschaftlichen Literatur insbesondere des 19 Jahrhunderts*; Haldane, J. S., *The Philosophy of a Biologist*; Hartmann, Nicolai, *Zur Grundlegung der Ontologie*; Hoffman, Ernst, *Platonismus und Mystik im Altertum*; Kraft, Julius, *Die Unmöglichkeit der Geisteswissenschaft*; Lamont, Corliss, *The Illusion of Immortality*; Laun, Rudolf, *Recht und Sittlichkeit*; Litt, Theodor, *Philosophie und Zeitgeist*; Losski, Nicolai O., and Marshall, J. S., *Value and Existence*; Lovejoy, A. O., and others, *A Documentary History of Primitivism and Related Ideas*.

Also Löwith, Karl, *Nietzsches Philosophie der Ewigen Wiederkehr der Gleichen*; Maritain, Jacques, *Freedom in the Modern World*; Maritain, Jacques, *La philosophie de la nature*; McClure, M. T., *The Early Philosophers of Greece*; Messer, August, *Glauben und Wissen*; Mins, Henry Felix, Jr., *Materialism, The Scientific Bias*; Neurath, Otto, *Was bedeutet rationale Wirtschaftsbetrachtung*; Oestereich, Heinrich, *Freiheitsidee und Rechtsbegriff in der Philosophie von Johann Gottlieb Fichte*; *Proceedings of the Aristotelian Society*, 1934-35 and Sup. vol. xiv; Robb, N. A., *Neoplatonism of the Italian Renaissance*; Rolland, E., *La loi de réalisation humaine dans Saint Thomas et Le déterminisme monadique et le problème de Dieu dans la philosophie de Leibniz*; Saarnio, Uuno, *Untersuchung zur Symbolischen Logik*; Schaller, Heinrich, *Die Renaissance*; Schachter, Josef, *Prolegomena zu einer kritischen Grammatik*; Schilling, Kurt, *Der Staat. Seine geistige Grundlagen, seine Entstehung und Entwicklung*; Tonnies, Ferdinand, *Geist der Neuzeit*; *University of California Publications in Philosophy, Possibility*

PHOTOGRAPHY. Color processes led the aroused public interest in photography throughout the world during the year. The keynote of this interest was sounded in April with the announcement of Kodachrome, an entirely new three-color subtractive process of amateur motion pictures. The film was described by its inventors, L. Mannes and L. Godowsky, Jr., as being "multiple-coated on one side of the support with three emulsions, each sensitive to one of the primary colors, these emulsions being separated from each other by intermediate gelatin layers." Exposures are made in an ordinary 16 mm. camera at one stop larger than is used for black and white pictures. Processing is carried out in special continuous machines which develop and reverse the film, as well as transform each image successively according to its depth, into its corresponding complementary color. Three closely superimposed positive dye images, free of silver and silver salts, comprise the final picture. This process truly represents a triumph in chemical research and emulsion manufacturing skill. (*Brit. J. Phot.* 82: 275, May 3, 1935; also *J. Soc. Mot. Pict. Eng.* 25: 65, July, 1935.)

Another significant event of the year was the release of the first full-length feature picture, "Becky Sharp," made on 35 mm. film by the three-color subtractive process of Technicolor, Inc. The plans of the major producing companies for 1935-36 indicated that an extensive use will be made of color especially in connection with the various

types of short subjects. (*Motion Picture Herald* 120: 13, July 20, 1935.)

A color newsreel, by the Dufaycolor process, of the 25-year Jubilee of England's sovereigns was shown in the London theatres in May.

It was reported that Walt Disney, who has pioneered so successfully in the use of color in sound cartoons, was working on a color feature cartoon, *Little Snow White*, to be completed in 1936. (*Fortune* 10: 88, November, 1934.) It is also of interest that all details of the story action in a sound cartoon are cued according to the bars of music; 24 frames to the bar for normal tempo, 32 frames for slower tempo, and 20 frames for faster tempo. Picture, music, and sound effects are each recorded separately and later combined by re-recording. (*Amer. Cinemat.* 16: 76, February, 1935.)

Further improvement was noted in the quality of the three-color work being done by commercial photographers. Some workers, like Steichen, made only a two-color negative separation from which were printed three positives. (*Comm. Photog.* 10: 256, May, 1935.)

New color print processes of commercial interest were the Irix and the Chromotone methods. The former was stated to be an imbibition process utilizing a special type of dyed wash-out reliefs. With the latter, three metal-toned collodion-gelatin layers were "registered" on a paper surface.

Aerial photographs were being made daily in some part of the world of events of sufficient importance. The larger newspapers of the world owned one or more planes but none were probably better equipped than the "Early Bird," the amphibian monoplane of the *Detroit News*. Three camera installations at different locations within the plane made it possible to photograph at any desired angle. A gunsight mounted on the pilot's windshield served as the view finder and the cameras were operated either by the pilot or the observer by remote control. (*Editor & Publisher*, 67: Jan. 12, 1935, p. 11.)

Much of the exploration work of the second Byrd Antarctic Expedition was carried out right in the huts under the snow at Little America by studying aerial photographs made during the flights.

Aerial photographs were made regularly of the lake formed by Boulder Dam in Arizona for each 20 feet rise of the water. An exhaustive study of soil erosion was being made from these photographs in the programme to protect the life of the reservoir. A special ten-lens camera was used for certain parts of this project and for a survey in the Rio Grande valley where a total of 84,000 square miles of territory was being mapped for the Federal Government.

The stratosphere balloon, *Explorer II*, with Capt. A. W. Stevens, observer in charge, and Capt. O. A. Anderson as pilot, ascended to a new world's record of over 72,300 feet on Nov. 11, 1935. Much useful photographic data were collected during this successful flight, which was sponsored by the National Geographic Society and the U.S. Army Air Corps. The camera was carried to the lowest depth that man has ever descended in the oceans of the earth when Beebe was lowered 500 fathoms (3028 feet) in his "bathysphere" globe in August, 1934. (*Nat. Geog. Mag.* 66: 661, December, 1934.)

Advantages of copying books, manuscripts, and bibliographical data on 35 mm. and 16 mm. film are listed by Schellenberg as follows: (1) making accessible rare editions, expensive collections, original data; (2) preservation of impermanent materials; (3) making available special catalogues and

other classified data. (*Library J.* 60: 289, April, 1935.) Over 150,000 pages of facts and figures of the NRA proceedings were recorded on 16 mm. film occupying about one cubic foot of storage space. A Shanghai publishing firm had started the enormous task of photographing each page of a handwritten Chinese encyclopedia which fills 1500 volumes.

A permanent photographic record is made of each vote in the Riksdag or Swedish Parliament by photographing a panel showing the location of the members and their vote. (*Sci. Amer.* 152: 276, May 1935.)

Progress in motion pictures was distinguished by improvements in equipment and technic of operation. Further advances in sound recording methods were noted and added realism in both sound and picture effect was attained. (*J. Soc. Mot. Pict. Eng.* 25: 3, July, 1935.) Five leading newsreel producers completed an agreement to standardize the recording volume level to approximate that used when recording feature pictures.

Considerable interest in a stereoscopic motion picture was given by Louis Lumière, one of the great pioneers of the motion picture industry. Pairs of stereoscopic pictures occupying a single frame were projected through separate color filters and viewed with spectacles of which one glass transmitted from 550 mμ to 640 mμ and the other transmitted on either side of this band. (*Camera* 13: 336, April, 1935.) The 40th anniversary of Lumière's introduction of one of the first motion picture cameras and projectors was observed with appropriate celebrations in France in November.

It is probable that the growing demand from colleges and museums for material for the study of the motion picture as a living art will be supplied in part at least by the newly endowed Museum of Modern Art in Rockefeller Center, New York City. (*Mot. Pict. Herald* 119: 15, June 29, 1935.)

Evidence of the rapidly growing conviction of the value of the motion picture as an educational medium was shown by the announced programme of Germany to equip her 60,000 schools with 16 mm. projectors within the next six years. (*Phot. Dealer* 49: 54, February, 1935.)

Photomicrographs in color by the Finley process were used as evidence to identify fragments of glass found in the jacket of an accused person in an English trial. Plans to introduce color photomicrography at Scotland Yard were also announced. (*Brit. J. Phot.* 82: 285, May 3, and 349, May 31, 1935.)

A film showing growing crystals in color won a medal at the 80th Annual Exhibition of the Royal Photographic Society (London). The pictures were photomicrographs and the photography was by the Kodachrome process. Toch has used infrared photography effectively to distinguish between original paintings by the old masters and modern copies of such paintings. The infrared pictures of the older paintings revealed characteristic brush strokes not shown by the copies. (*New York Times Mag.*, Aug. 23, 1935, pp. 10-11.) The research supplements that of Ainsworth-Mitchell and of Laurie in England (*Analyst* 59: 657, October, 1934).

Photographs were made for the first time of fuel oil burning inside a Diesel engine. Light from an electric spark (one ten millionth second) was used to illuminate the oil spray moving 800 feet per second. Pictures were made through a special glass window in the side of the combustion cham-

ber, using a camera operating at 2500 frames per second.

Other interesting applications of the motion picture camera for recording data were (1) measurement of the landing speed of Boeing transport planes (*Sci. Amer.* 152: 315, June, 1935); (2) determination of the cause of sway of electric railway car trucks by mounting an ultra-rapid camera under the car while in regular service (*Forbes* 36: 13, Oct. 1, 1935); (3) recording the finishes of horse races at Le Tremblay near Paris (*Photography* 3: 44, March, 1935) and at Santa Anita near Los Angeles (*J. Soc. Mot. Pict. Eng.* 25: 28, July, 1935). The last named equipment photographs the time of predetermined intervals of the race and also photographs the finish and the total elapsed time. In less than three minutes after the finish, an enlargement of the finishing frame can be delivered to the judges' stand.

A special 8 mm. Cine Kodak recorded the dials on the instrument panels of Sir Malcolm Campbell's racing automobile, the *Blue Bird*, when he set a world's record of over 301 miles per hour in September on the Salt Lake flats of Utah. (*Phot. J.* 65: 599, November, 1935.)

Oscillograph records were made by Jasper and Carmichael of Brown University of electrical impulses accompanying brain activity. Such records are known as "electrocephalograms," analogous to electrocardiograms of heart action. (*Science* 81: 51, Jan. 11, 1935.)

Further applications of soft x-radiation were exhibited at the Royal Photographic Society in September by the Kodak Laboratories. These consisted of examples of treatment of crepe fabrics, the weighting of silk with metals, leather and paper structures. Sets of stereo soft radiographs of small biological specimens elicited favorable comment. An improved zinc sulphide fluoroscopic screen, which was said to be free of afterglow, was described by Swindells as an improvement over the more common cadmium tungstate screen. (*X-Ray Tech.* 6: 162, April, 1935.)

In the field of photolithography, color gravure reached a high level of quality at over two times the speed of offset printing. (*Nat. Lithographer* 42: 22, March, 1935.) Richer colored postage stamps were made by the intaglio process than were producible by surface printing although maintenance of uniformity was quite difficult. (*Penrose's Ann.* 37: 95, 1935.) Murray published a detailed discussion on the relation of natural color photography to printing. (*Brit. J. Phot.* 82: 3 et seq., Jan. 4, 1935.)

Physical Measurements. The ninth meeting of the International Congress of Scientific and Applied Photography was held in Paris, July 7 to 13. Although this body has no executive power, it serves a very useful purpose among several countries for the exchange of ideas and information related to the manufacture and use of photographic materials. Discussion at the Paris meeting centred mainly around two subjects: (1) standardization of the method of measuring and evaluating speed, and (2) 16 mm. sound-on-film standards.

(1) Agreement had been reached on the specification of a standard light source for sensitometry at the previous Congress held in Dresden in 1931. The bulk of the discussion at the present meeting concerned several specifications given in a Standards Sheet (DIN 4512) adopted by the Germans in January, 1934. The method specified the standard light source, a $\frac{1}{250}$ second exposure (intensity scale)

Store Window Photographed with Polarizing Screen over Camera Lens to subdue Reflections

Store Window Photographed in Ordinary Way. Note Reflections from Street and Adjoining Store

and an optimal time of development to give the highest speed figure.

Delegates from 10 of the 11 countries voted against optimal development, the German delegates being the only ones favoring it. The majority felt that development should be carried out for any given material according to the instructions supplied by its manufacturer. The majority favored the method of evaluating speed somewhat as proposed by the Germans, namely, based on the exposure corresponding to a density of 0.1 above fog. Another method was also discussed extensively. This method involved the determination of the exposure necessary to produce a gradient of a fixed fraction of the maximum gradient obtainable with the material.

It was generally recognized that this latter method was ideally more satisfactory than the former, but that there had been insufficient time to test it out thoroughly. An instrument was described, however, which enabled speeds to be determined in this way with the ease of the DIN 4512 method. (*J. Opt. Soc. of Amer.* 25: 396, December, 1935.)

No final decision was reached but votes were taken on all the points concerned, with a view to providing a basis for further work and discussion, so that an internationally acceptable proposal could be adopted at the next Congress.

(2) The 16 mm. sound film situation had become complicated by the fact that the German manufacturers of equipment had fitted their factories to build apparatus which takes a film having one row of perforations arranged on the right when the film is threaded in the projector with the gelatin side away from the screen, whereas in the American standard, the film is turned around to face the other way. A misunderstanding arising from the method of drawing up the American specifications and of interpreting them caused the difficulty. At the joint meeting of the Congress and the International Standards Association (an executive body), it was decided to refer the problem to the various national committees for further consideration.

Webb, in a continuation of his work and that of Jones on reciprocity law failure in photographic exposure, showed that the effect of temperature variation upon emulsion sensitivity was very strongly dependent upon the intensity level at which the exposures were made. At very low intensities, it was found that the speeds of certain emulsions could be increased several-fold by lowering the temperature. (*J. Opt. Soc. Amer.* 25: 4, January, 1935.) At the International Congress session in Paris, Sheppard read a paper which attempted to interpret Webb's results and proposed a mechanism. (*Sci. et ind. phot.* [2] 6: 241 et seq., August, 1935.)

A description was given at the 1935 Congress of the microdensitometer used by Van Kreveld in his studies on the graininess of photographic deposits. (*Sci. et ind. phot.* [2] 6: 271, August, 1935.) Keck reported on a continuation of Van Kreveld's work (*Phot. J.* 75: 521, September, 1935.)

Davies and Owen described a visual photometer with which both accurate transmission and reflection densities can be measured. A visual as well as a photoelectric method of calibrating the instrument had been evolved. (*Phot. J.* 75: 128, March, 1935.)

Eyles and Selwyn devised an apparatus for obtaining the curves relating area with time in photographic between-the-lens shutters. A set of separated and illuminated apertures fitted with neutral

glass filters passing certain standard fractions of the light is imaged by a lens on a film wrapped around a revolving drum, the shutter acting as a diaphragm for the lens. One exposure is made with the shutter open and one without the filters and the points are found at which adjacent bands have similar densities. (*Proc. Phys. Soc.* 47: 446, May, 1935.)

The principal factors affecting the reliability of measurement in photographic photometry of Roentgen rays were discussed by Wilsey. (*Amer. J. of Roentgenology and Radium Therapy* 32: 789, January, 1935.)

Sensitized Materials, MANUFACTURE OF. The question occasionally arises as to how long images on film will last. This subject is of especial interest to libraries and archives who are recording many records on film. Bendikson attempted to answer the question by examining one of the French microscopic dispatches prepared in 1870 by M. Dagron. Sections of these were enlarged 32 times linearly and showed an excellent stage of preservation although the original was over 64 years old. It was concluded from this examination that if reproductions are made with the proper care and preserved adequately, they should still be useful after the year 2000. (*Library J.* 60: 143, Feb. 15, 1935.)

An improved method of optical sensitizing of emulsions consisted in dyeing the silver bromide (free of a carrier) and then dispersing it in the gelatin by ultrasonic vibrations. This method is claimed to result in much less dye being absorbed by the gelatin than when the usual methods of desensitizing are employed. (*Z. tech. Physik* 16: 109, 1935.) Improvements in emulsion making technique were described by Fuchs, including control of grain size by addition of crystallization inhibitors, easier control of physical hardeners by adding di-aldehydes, and the addition of fog-clearing secondary and tertiary aromatic amines. (*Phot. Ind.* 33: 191, Feb. 27, 1935.) Steigmann discussed the effect in emulsions of ripening-restraining substances in the gelatin. (*Sci. ind. phot.* [2] 6: 1, January, 1935.)

Several Russian investigators reported on further studies related to photographic emulsions. Subjects discussed included: (a) influence of acid substrata on the photographic properties, wherein it was shown that the desensitizing effect is proportional to the molecular concentration of acid retained in the substrata; (b) effect of pH on hypersensitization with ammonia and various buffer solutions; (c) influence of replacements of groupings in the thiocyanine dyes on their usefulness as optical sensitizers. (*Photo-Kino Chem. Ind.* No. 1-2, 1935.)

Brooker and his co-workers, Keyes and White, discussed methods of preparing carbocyanine dyes which have permitted sensitizing of photographic plates far into the infrared spectral region (*J. Franklin Inst.* 219: 255, March, 1935, and *J. Amer. Chem. Soc.* 57: 547, March, 1935.) Results obtained with the extreme infrared sensitive Type I-Z plate were described by the U.S. Bureau of Standards in their studies on spectra of noble gases to 13,000 Å, (Research Paper 781, U.S. Bureau Standards, 1935) and by Mt. Wilson Observatory in their solar spectra investigations. Lines between wavelengths 12,800 and 13,536 were recorded after 11 hours exposure. (*Catalogue Roy. Phot. Soc. 80th Annual Exhib.*, p. 35, 1935.)

Several of the new sensitive materials announced were (a) a motion picture negative film having a speed about 90 per cent faster than previous high

speed panchromatic materials and of the same color sensitivity and fineness of grain (*Amer. Cinemat. 16*: 186, May, 1935); (b) an improved color screen film of German origin (*Camera*, Dublin, 14: 633, July, 1935); (c) a color roll film in several amateur camera sizes as well as 16 mm. cine rolls (*Amat. Phot. and Cinemat. 80*: 191, Aug. 21, 1935) and infrared roll films for amateur cameras using 35 mm. film (*Brit. J. Phot. 82*: 18, June 2, 1935).

Great progress for the years 1934 and 1935 was reported in the establishment of a photographic industry in the Soviet Union. (*Photo-Kino Chem. Ind.* No. 1-2, 1935, and *Soviet Kino Photo Ind.* No. 1, 1935.)

Apparatus. New. The introduction of an efficient plane polarizing sheet material in sizes large enough to cover lenses and lights greatly simplified the use of polarized light in photography. By covering the lens with the screen, unusual sky effects may be obtained, photographs obliquely made through glass and water are free of reflections, and other surfaces may be photographed obliquely to reveal surface details. Complete control of gloss is possible, when the sheet material is used both over the illuminant and the lens. (*J. Soc. Mot. Pict. Eng. 25*: 69, July, 1935.) The polarizing sheet is the invention of Edwin H. Land and several examples of its use were awarded the Hood Medal at the 80th Annual Exhibition of the Royal Photographic Society.

An improved type of photoflash lamp was equipped with a warning mark, a cobalt salt which changed from blue to pink if there was a danger of the lamp shattering during ignition. (*Focus 22*: 6, Mar. 16, 1935.)

A new apparatus for aerial photography and mapping was equipped with a moving band of paper on which are sketched the contours of objects photographed. (*Brit. J. Phot. 82*: 62, Jan. 25, 1935.)

Several new models of amateur cine cameras were announced for use with 8 mm., 9.5 mm., and 16 mm. films. (*Phot. Dealer 48*: 480, December, 1934; *Amer. Cinemat. 16*: 270, June, 1935; *Film fur Alle 9*: 209, July, 1935.) A 16 mm. camera designed in Vienna incorporated an automatic exposure meter of the selenium type coupled with the camera lens diaphragm. (*Brit. J. Phot. 82*: 468, July 26, 1935.)

As a result of the two sound-on-film standards for 16 mm. projectors (the DIN and the S.M.P.E.) at least one make was known to have been designed so as to take either type of film. (*Brit. J. Phot. 81*: 719, Nov. 30, 1934.) See under *Physical Measurements*.

For color photography of still subjects and certain types of moving subjects, repeating backs may be used for making the three separation negatives. One type was described which was claimed to permit the three exposures to be completed in a total time of $\frac{1}{6}$ second. (*Bull. soc. franc. phot. 22*: 121, May, 1935.) A new practical one-exposure commercial color camera was announced by a British firm. (*Brit. J. Phot. 82*: 587, Sept. 13, 1935.) The Technicolor trichrome camera used a beam splitter to give the green negative on a single film and the blue (front) and red (back) negatives on a bi-pack. (*Amer. Cinemat. 16*: 18, Jan. 1935.)

An enlarger of revolutionary design was announced for use in printing from miniature negatives. A negative carrier on a table is illuminated from below and the image projected onto the paper held in a frame about one foot above the table top. A reflected image of the enlarged negative image

is visible to the operator at all times. (*Developments 10*: 4, August, 1935.)

The trend in methods of printing 16 mm. photographic sound records from 35 mm. film favored optical printing rather than by re-recording. Two types of optical printers for this type of work had many useful features. (*J. Soc. Mot. Pict. Eng. 25*: 117, August, 1935; *Movie Makers 10*: 473, November, 1935.)

An instrument known as an "argentometer" was described which permitted rapid measurement of the silver content of a used fixing bath. The action of the device depended on the change of transparency of a solution containing silver and hypo after the addition of sodium sulphide and certain other chemicals. (*J. Soc. Mot. Pict. Eng. 25*: 335, October, 1935.) Ives described a special type of roller developing rack with which continuous machine developing conditions could be simulated in a rack and tank system. (*J. Soc. Mot. Pict. Eng. 24*: 261, March, 1935.)

Photographic Process. THE. Comparatively little is known about the chemistry of development apart from ferrous oxalate development, but it is encouraging to note the publication of more data each year on this important subject. The oxidation of ordinary alkaline sulphite developers containing several different developing agents was studied by Lehmann and Tausch, who found that stages in the formation of mono-, di-, and probably higher sulphonates were clearly marked in the case of aerial oxidation because of the intermediate formation of hydrogen peroxide. Metol monosulphuric acid was isolated and found to be a developing agent which may be useful for fine grain development. (*Phot. Korr. 71*: 17, February, 1935.)

The ability of p-phenylenediamine to develop images of low graininess was found experimentally by Jacobsohn to be a function of its low developing energy. (*Phot. Ind. 32*: 1242, Nov. 21, 1934.)

A new fine grain developer was announced by Vittum and Crabtree who claimed it to be capable of producing images equally as fine and with about the same speed loss as those obtained with paraphenylenediamine developers without added alkali. A faster development rate, and freedom from stain and toxicity compared with paraphenylenediamine were also claimed as advantages. The nature of the developer was not revealed. (*Camera Craft 42*: 587, December, 1935.)

Development was shown by Faerman and Shishkina to be independent of the specific nature of the alkali provided the pH remains the same. The acidity of developers was found to be one of the factors controlling the oxidation-reduction potential. (*Photo-Kino Chem. Ind.* No. 1-2, 30, 1935.) Seyewetz and Szymson gave data on the quantity of bromide reduced by various developing agents as a function of the ratio of alkali to reducing agent. (*Bull. soc. franc. Phot. 21*: 250, December, 1934.)

Weyde gave data on the exhaustion life of a paper fixing bath (20 per cent hypo) as three hundred 9 by 12 cm prints per liter and about the same number for a 2 per cent acetic acid rinse bath. (*Brit. J. Phot. 82*: 326, May 24, 1935.)

Photographic Theory. Factors in photographic sensitivity were discussed by Sheppard under the headings of (1) intrinsic properties such as grain size, nucleation, optical sensitizing, layer thickness, etc., and (2) extrinsic factors including intensity level of illumination, temperature, and humidity. (*J. Soc. Mot. Pict. Eng. 24*: 500, June, 1935.)

Weigert published a summation of his investiga-

tions relating to the micelle theory of the latent image in which he claimed that it explains the sensitivity spectrum, the Herschel and Schwarzschild effects, desensitization by dyes, and physical development. (*Phot. Korr., Suppl. Beilage No. 6* 70: 41, November, 1934.)

Reinders and Dingemans studied the rate of oxidation of hydroquinone with atmospheric oxygen and found it to be proportional to the hydroquinone concentration, oxygen pressure and the square of the hydroxyl concentration. The unstable hydroxyquinone is formed as the primary reaction product. (*Rec. trav. chim.* 53: 209, 231, and 239, 1935.)

It was shown possible by Kellner and Bennewitz to develop photographic papers on electrodes of silver, zinc, and mercury. Formation and diffusion of atomic hydrogen which reduces the exposed areas faster than the unexposed was considered the effective process. (*Z. wiss. Phot.* 33: 212, 225, 1935.)

Arens observed the significant fact that solarization is shown only very feebly on physical development after strong intensity-scale exposure whereas it appeared after a time-scale exposure and with either chemical or physical development (*Z. wiss. Phot.* 33: 281, 1935.)

A comprehensive and suggestive paper on the chemistry of organic sensitizers, desensitizers, and developers was presented at the Congress of Photography by Kendall. At this same meeting, Chibisoff gave a valuable paper on the ripening of photographic emulsions. (*Sci. et Ind. Phot.* [2] 6: 248 and 290, August and September, 1935.)

Bibliography. Accounts of photographic progress are published each year by the *British Journal of Photography* (London) and the *Society of Chemical Industry* (London). Cinematographic progress is reviewed annually by the *Society of Motion Picture Engineers* (New York). New apparatus is described in the *British Journal of Photography* (London), *Deutscher Kamera Almanach* (Berlin), *Photofreund Jahrbuch* (Berlin), and *Jahrbuch des Kineamaturs* (Berlin).

The first number of the *Journal of the Motion Picture Society of India* made its appearance as the official publication of that society. The *Home Photographer and Snapshots* (London) initiated by George Newnes, Ltd. in 1933 was continued. The official publication of the *Miniature Camera Club of New York*, *The Miniature Camera*, was withdrawn.

The more notable books of the year were

The Photography of Colored Objects 13th ed revised (Eastman Kodak Co., Rochester); M. C. F. Beukers, *Fotografische Ontwikkelings*, (Waltham, Jr., Delft); L. J. Hibbert, *A Manual of Photographic Technique*, (Pitman & Sons, London); T. T. Baker, *The Kingdom of the Camera*, (Bell & Sons, London); W. M. Strong, *Photography for Fun*, (The Maple Press, New York); A. Adams, *Making a Photograph*, (Studio Publications, Inc., New York); J. M. Blair, *Practical and Theoretical Photography*, 2nd ed. (Mimeographed at the University of Colorado, Boulder, Colo.); W. D. Morgan and H. M. Lester, *The Leica Manual*, (Morgan & Lester, New York); G. Potonié, *History of the Discovery of Photography*, trans by E. Epstein, (Walker Engraving Corp., New York); F. R. Fraprie, *The Secret of Exposure*, (American Photographic Publishing Co., Boston); F. I. Jordan, *Photographic Enlarging*, (Folmer-Graflex Corp., Rochester); F. R. Fraprie and A. Hammond, *How to Make Enlargements*, (American Photographic Publishing Co., Boston); W. Mortenson, *Pictorial Lighting*, (Camera Craft Publishing Co., San Francisco); P. Lullack, *Bastelblätter und Bauanleitungen zur Fotoarbeit*, (Knapp, Halle); O. Nordhardt, *Photogerät selbst basteln*, (Hochmeister & Thol, Leipzig); D. C. Ottley, *The Cine Amateur's Workshop*, (Routledge & Sons, London); A. L. Gale and R. C. Holslag, *Making Better Movies*, revised ed., (Amateur Cinema League, New York); G. P. Kendall, *Film Tinting*, (Newnes, Ltd., London); J. H. Reyner, *Cine Photography for Amateurs*, 2nd ed., (Chapman and Hall, London); W. Kross, *Der Film für Alles*, Das Fotografieren mit Panchro, (Knapp, Halle); P. W. Harris, *Home Processing*, (Newnes, Ltd., London); D. C. Ottley, *Making Home Movies*, (Newnes, Ltd., London); D. C. Ottley, *Practical Set Structure for the Amateur Cinematographer*, (Pitman and Son, London); J. R. Cameron, *Sound Motion Pictures* (Cameron

Publishing Co., Woodmont, Conn.); V. I. Pudovkin, *Film Acting*, trans. from the Russian by I. Montagu, (Newnes, Ltd., London); J. S. Mertle, *Process Photography and Plate Making*, (Cramer Dry Plate Co., St. Louis); L. P. Clerc, *L'Industrie des Produits Photographiques*, (Gauthier-Villars, Paris); H. Bouasse, *Optique et Photométrie dites Géométriques*, (Librairie Delagrave, Paris); T. A. Wilson, *The Practice of Collotype*, (American Photographic Publishing Co., Boston); A. W. Judge, *Stereoscopic Photography*, 2nd ed., (Chapman & Hall, London); C. F. Lan-Davis, *Telephotography*, 4th ed., by H. A. Carter, (Pitman & Sons, London); A. Charriou, *Etude de la Sensibilisation chromatique et de la Desensibilisation des émulsions photographiques*, (Gauthier-Villars, Paris); *Photomicrography*, 13th ed., (Eastman Kodak Co., Rochester); R. Russ, *Handbuch der Modernen Reproduktionstechnik*, vol. II, *Chemigraphie*, (Klmsch & Co., Frankfurt am Main); H. Sporr, *Photographisches Rezeptbuch*, 7th ed., (Knapp, Halle); *Practical Photography and Amateur Cinematography*, vols. I-III, edited by E. Malloy, (Newnes, Ltd., London).

A partial list of the handbooks and annuals appearing during the year is as follows: *Agfa-Veroeffentlichungen des wissenschaftlichen Zentral-Laboratoriums—Der Photographischen Abteilungen*, vol. IV, (Hirzel, Leipzig); *American Annual of Photography*, 1936, vol. I, (American Photographic Publishing Co., Boston); *Photofreund Jahrbuch*, (Photokino Verlag, Berlin); *British Journal Almanac*, (Greenwood, London); *Deutscher Kamera Almanach*, (Union Deutsche Verlag, Berlin); *Jahrbuch des Kineamaturs*, (Photokino Verlag, Berlin); *U. S. Camera*, (Morrow & Co., New York); *Kinematographic Year Book*, (Kinematograph Publications, Ltd., London); *Film Daily Year Book of Motion Pictures* (Film Daily, New York); *Motion Picture Almanac*, (Quigley Publications, New York); *Penrose's Annual*, (Lund Humphries & Co., London); *Klmsch's Jahrbuch*, (Klmsch & Co., Frankfurt a/Main).

PHYSICAL ANTHROPOLOGY. See ANTHROPOLOGY.

PHYSICS. The year 1935 was notable for progress in cosmic ray research. The upper air is now a cosmic ray laboratory from which continuous automatic observations come by radio to the earth for record and study. The great achievement, however, is experimental proof cited by Rutherford, for the first time, that mass and energy are interconvertible. For this 1935 marks an era in physics. The technique of transmutation engages worldwide research and its successes in rapid sequence are realizing the age-old dream of alchemy. More noteworthy still is the fact that such transformations release energies vast compared with the infinitesimal magnitude of the atoms in which they occur. This achievement may prove to be unequalled in human history as a contribution to human welfare.

Air. The air is now an active field of discovery as affected by radiation including gamma, ultraviolet, and cosmic rays and particles. Electrons are concentrated at 60 to 90 miles and 125 to 150 miles. Knowing their velocity, the height which they would reach can be measured. Stetson is studying the electron tides caused by the moon.

Gowan found at 25 miles up there should begin a rise in temperature. Records show that the upper polar atmosphere is warmer than that over the equator. The warmth of the upper air is caused by absorption in oxygen and ozone, oxygen being more effective in lower parts. Ozone absorbs ultraviolet. If the air were of uniform density, it would form a layer five miles deep. If oxygen were separated likewise, it would form a layer one mile deep, the ozone would form a layer three millimeters deep on the average.

The upper air has attracted many investigators. Russian sounding balloons have ascended 25 miles. Sounding balloons in the stratosphere may be equipped for sending back to the earth meteorological data by radio. The results show that such automatic devices may gather all essential data without the risk attending manned flights. The diving bell so successful in deep sea exploration was quickly

followed by the "bubble gondola" for stratosphere flight. The success of Romano and Beebe was duplicated by Piccard and others. Stevens and Anderson in a record flight with *Explorer II*—a balloon of record size—reached an altitude of 72,395 feet. Scientific preparations were unsurpassed and were completely successful.

Tuве and Wulf plan the study of the upper atmosphere by using light beams reflected from the stratosphere. The reflected beam is identified simply by initial "modulation"—rapid interruption at the sending source. The study will cover atmospheric density, high clouds, fluorescence, and other phenomena.

Rocket. Erickson devised a new type of rocket engine propelling the rocket by intermittent acceleration. Compressed air produced by the rocket's speed mixes with fuel to form the explosive mixture. Goddard is busy on his daring project, a "space-rocket." Suggestive of the first Wright starting frame, Goddard's new tower was used to give his rocket an altitude of 7500 feet at a maximum speed of 700 miles an hour, the greatest rocket speed ever attained. Korneyev has devised a stratosphere rocket with an estimated ceiling of 40 miles and a speed of 2100 feet per second.

Radio. Among the triumphs of applied physics must be listed the design, production, and sale of five million radio receiving sets. Armstrong devised a new ultrashort wave frequency modulation to eliminate static and tube noises. Even nearby lightning does not mar reception; facsimile print was transmitted simultaneously with the same wave length as music. Langer explains Jansky's puzzling extra-terrestrial radio pulses from a definite point in space. He states that interstar dust—electrified by interstellar radiation—sends out a wave from each particle. Dellinger discovered a temporary but complete fading out of high frequency radio signals at long distance, which may correlate with intervals twice the time of the solar revolution, that is, once every 54 days. He found also that every fade-out appears to be correlated with an observable change in the sun.

Electron Optics. Zworykin devised a new telescope focusing electron rays as the eye focuses light. A special feature of the electron telescope is that its images have no spherical aberration. The Zworykin and Morton electron telescope makes infrared and ultraviolet visible. Electron optics is extending the use of electrons to many visual arts. We may perhaps expect of electron optics applications as numerous as those of light waves.

Another new device by Zworykin—the electron multiplier—has many important applications. Bombarded with high speed electrons, it emits a current far greater than the exciting stimulus. With cesiated silver this gain in current is a million times greater than the initial current.

Morton describes the electron optics of electron microscopy with special reference to biology. Cell structures were studied as magnified one thousand times. Hanneberg also discusses the electron microscope assuming that the electrons are of de Broglie wave length.

Stockberger grew lithium fluoride in large clear crystals for lens making. LiF is the best known transmitter of ultraviolet light. At the Boyce Thompson laboratory the new sodium vapor lamp was found the most effective in accelerating the growth of plants.

Progress is being made on an important fundamental principle that specific frequencies dominate

specific applications of light to control inorganic and organic matter and organisms. An example in biophysics is reported by Bachem as to wave length used in radiation therapy specific for particular tissue; 3.5 meter waves were most effective on fat, inducing heat; 5 meter waves heated the liver and hair most effectively; 7 meter waves were the most effective on bone and marrow.

Matter and Materials. Von Grosse isolated protoactinium, element no. 91, rarer than radium in pitchblende. Unhappily during an experiment his specimen—the entire "world's supply"—of protoactinium disappeared and von Grosse is now extracting a new specimen.

Van Vleck discusses the quantum theory of valence: (1) molecular orbits; (2) homo-polar method, finding that neither is dependable except when both agree. Both predict a nearly right-angled model for water and a tetrahedral one for methane. The molecular orbit method seems to have the better computational value.

Bridgman continues his revealing experiments on high pressure. His latest progress was to increase high available pressure from 12,000 to 50,000 atmospheres. Such pressure transforms the properties of materials in new and astonishing ways. Rubber and paper lose their elasticity and become translucent and horny. Red phosphorus is made black, the electric resistance of some metals is increased and brom-thymol—ordinarily soluble—becomes insoluble under the superpressures.

Sound. A recent acoustical achievement is a sound record film nine inches wide carrying a complete symphony score of about a hundred musical instruments. Each separate sound track was first produced by a master musician with a perfect instrument and carried only the music range of one instrument.

Volnov, Avranov, and Yanovski have created synthetic music from repeated cut-outs, each having a wave form. At their studios at Potylikha in Moscow has been produced ingenious music repeating the graphic curves of stock quotations and even profiles of the human face have yielded synthetic music. This recalls the face profile drawn by Michelson with his harmonic synthesizer based on a Fourier series.

In telephony one sound in a word may have one-thousandth the volume of the sound next following. Weak sounds were lost in static and strong sounds overloaded the amplifiers. In transatlantic radio telephony, the Bell laboratories new "Componder" transmitter system (compressor and expander) automatically reduces the stronger sounds and strengthens the weaker. At the receiver the sounds are automatically restored to normal, 15 decibels.

Knudsen found that in oxygen with humidity 20 per cent the high notes of the violin and piccolo could not be heard 50 yards away. Laboratory measurements show that a motor requires from 0.1 to 1.0 watts of energy; an orchestra of 75 pieces 0.5 watt rising to 50 in heavy passages. The human voice 10 microwatts, increasing to a milliwatt when shouting.

Cosmology. Einstein and Rosen announce an approach to a new theory designed to link relativity and the quantum theory. Sulaiman's relativity assumed that gravitation is propagated with finite velocity by small particles, gravitons not affected by gravitation but having momentum. The theory gives an explanation of the perihelion defect of the planet Mercury and the deflection of sunlight.

Haas computed the number of particles in the universe to be 1.2×10^{79} and the radius of space to be 93×10^{27} cm. Japolsky regards elementary particles as whirls in free space on the classical basis that their stability rests on relativity and quantum and wave mechanics. Electrons and protons are described as electropolarized whirls; and positrons and light quanta as magneto-polarized. Contra-polarized whirls cause gravitation. He finds the theory agrees with Maxwell's equations.

Subatomic Particles. Heisenberg assumed a strong mutual attraction of neutron for proton as a basic fact. Classical electrostatics creates a barrier, beginning at the edge of the nucleus. Bainbridge finds new evidence for the neutrino (Fermi's theoretical massless particles without charge). He finds the neutrino concept helps explain the atomic isobaric weights, 115 of indium and tin; 123 for antimony and tellurium; and 113 for cadmium and indium. Monad-Harzen summarized the subject of neutrons citing 288 articles.

Yeh found that neutrons and protons form layers in the atomic nucleus. Ellasser suggested that an electron is a vortex ring of radius $h/2\pi = mc$ in which the electron charge circles with the speed of light giving a magnetic moment of 1 Bohr magneton, accounting for the spin. Attraction or repulsion results as their spins are parallel or antiparallel.

Radioactivity. An intense search for ways to make matter radioactive is under way. Sodium is a successful example. With suitable bombarding technique, sodium may be made radioactive and the treatment equivalent of radium will be greatly cheapened by the so-called "radioactive table salt" which gives the power of radium treatment for one day.

Bombardment of nuclei, chiefly with light atoms, requires high voltages. Seventeen installations of Lawrence cyclotrons are reported capable of producing rays of 15 million electron volts with which to bombard atomic nuclei for transmutations and to produce artificially radioactive material.

Perrin found the cross section of light atoms for capturing neutrons to be inversely as their velocity. The cross section of a neutron of average thermal agitation proved to be 10^{-20} cm². The transformation of lithium by a million-volt proton liberates 17 million volts in transforming each atom—850 times the energy imparted to it. But only one proton in 10^8 makes a hit. The use of the chargeless neutron offers a new hope as an efficient bombarding particle.

Lauritzen and colleagues produced gamma rays with six times the energy (penetration) of natural radioactivity by using an artificial source of gamma rays of 16 million electron volts. Joliot and Joliot surveyed nuclear reactions and gave results of bombarding Al, B, Hg, with Po particles. Tests appear to confirm the view that the active nuclei resulting are unstable isotopes. Curie, Helban, and Preiswick produced a radium isotope by the reaction: $\text{Th}_{90}^{232} + n_0^1 = \text{Ac}_{88}^{229} + \text{He}_2^4$. This radium isotope yielded radioactive elements once regarded as actinium isotopes.

Transmutation. The age-old dream of alchemy, transmutation, has become a realized modern art. Aston and others now predict the synthesis of any element. He reports an accuracy of one part in 100,000. During the year Aston announced the discovery of 20 new isotopes, making the total known 247 and reporting that 72 elements have isotopes. To produce 10 drops of triple hydrogen

required a concentration from 75 tons of water.

The transmutation of lithium into Be (the lightest metal) was achieved by Lauritzen with 17 million volt-rays, eight times more powerful than any gamma ray from radium (2 million volts). Electron rays evoked by the change from lithium 7 to lithium 8 disclosed that lithium 8 is a new radioactive substance. Proton bombardment of lithium 7 changed it into Be 9. Lithium 6 produced artificially was found to be 10 per cent lighter when pure, whereas lithium 7 was 10 per cent heavier. Zipprich, studying the disintegration of Be with 50 kv protons, obtained a yield of 6.6 range alpha particles, equal to the yield from lithium.

Nuclear Transmutations. Fleishmann and Bothe summarized the recent astonishing progress in nuclear transformations by gamma and particle rays; production of deutons; disintegration by resonance; disintegration without capture; and disintegration with heavy nuclei and cosmic rays. They also covered branching transformation; multiple disintegration of same nucleus; formation of isotopes; artificial radioactivity induced by helium nuclei, deutons, protons, and neutrons; as well as neutrons from artificially radioactive materials; energy distribution, and electrons and positrons emitted; separation of radioactive isotopes, absorption and velocity of slow electrons; theory of interaction of nuclei and neutrons, gamma rays produced by helium nuclei, protons, and deuteron bombardment; nuclei of He^3 , Be^8 , elements 93 and 94 and radioactive series $4n+1$; nature of neutron, positron, neutrino, and negative proton; a summary of known nuclear reactions, characteristic of the nuclei of artificially radioactive atoms, accurate measures of light atoms. This excellent summary was accompanied by a bibliography comprising 272 titles.

Cosmic Rays. Cosmic rays bring to earth an amount of energy equal to 0.001 that of starlight and 10^{-9} that of sunlight. Once regarded as photons they are now known to be particles. In a magnetic or electric field positive rays curve in paths opposite to those of negative rays, whereas neutral rays pass undeflected. Anderson found a curve of an 18,000,000 volt electron and later the curve of a "positron." The energy required to bend the charged particles measures the so-called "magnetic rigidity." Geomagnetic bending forces start curving the rays hundreds of miles away in space. Much can be learned from the angles from which rays of particular rigidity—for example, a 10,000,000 volt positive electron—can reach the observer.

Swann and Compton suggested that sunspots on far distant suns are the source of cosmic rays. Branhill predicted that we may tap new sources of vast energy when we learn how to control processes evoked by cosmic rays. Johnson holds that negatively charged dust clouds over a star's surface attract positively charged atomic ions and project them into space like the beam of a cathode tube. He concludes that cosmic rays have equal intensity in intergalactic space as in our own galaxy. Hence such energy exceeds that of starlight—a conclusion, if true, of great importance.

Compton holds that because of the vast distances of the point of origin of cosmic rays and that since the earth's motion and that of the Milky Way are involved, those rays may yield data as to astronomical motions. It appears that high energy electrons have a radiation defect compared with electrical theory. Up to 70 million electron volts

they follow classical prediction, above this the electron departs from prediction. When electrodynamic theory is extended to the strongest fields, the cosmic rays may be one of the few means of adequate test. Thousands of photographs of cosmic ray explosions showed that many of the tracks were due to a heavy particle, having more energy than the nucleus could yield. Some of the incoming cosmic ray energies must be absorbed by the exploding fragments.

We may recall that cosmic rays disclosed the positive electron; that cosmic ray distribution threw light on the earth's magnetic field; that they are used as atomic bullets with thousands of times the penetration of man-made projectiles; that they disclose defects in electrodynamic theory; that they may affect life and death since thirty cosmic rays per second pass through the human body.

Compton's new word for lines of equal cosmic ray intensity is "Isocosms"—lines of equal geomagnetic intensity. He holds that 500 miles in space 99 per cent of cosmic radiation is electric particles, 1 per cent being photons or particles. The strongest cosmic rays can penetrate nearly 300 feet of solid lead. Occasional bursts show energies as high as 600 billion volts.

An event of the year was "Science Week" at St. Louis. Three thousand scientists attended to hear of a thousand research achievements. Outstanding were papers by Thorndyke on "Science and Values"; by Taylor "The Electric Eye and the Human Eye"; by Moulton "The Scientific Method in the Investigation of Economic Problems." Knudsen (prize winner of last year) reported on "The Absorption of Sound in Gases" and Zworykin on "Electro-optical Systems," and their applications.

Significant was the meeting of the National Advisory Council on Applied Physics at Pittsburgh to discuss means to promote the use of physics in industry. The aim is to shorten the time spread between discoveries in physics and their applications to daily life.

Nobel prizes were awarded to James Chadwick for his discovery and interpretation of the neutron and to J. Joliot and Irene Curie Joliot for first producing artificial-radioactivity.

Mass and Energy. Recent discoveries confirm Hasenohrl as to the fundamental relation between mass and energy—as mass appears, energy disappears and vice versa. The energy corresponding to mass 1 is 930 million volts and as stated by Rutherford 0.001 difference in mass is slightly less than a million volts. The positive electron coalesces with the negative electron and the mass changes to radiation corresponding to a million volts. Radiation required for this theory has been observed in two quanta simultaneously emitted in opposite directions. Rutherford reports that "under certain conditions pairs of electrons, positive and negative, are produced by the action of high frequency gamma rays." He states that this is the first time that evidence has been found that matter may be created by radiation. For the first time the change of energy into matter and matter into energy has had experimental support.

Bibliography. The year brought notable books. Jaffe's *Outposts of Science* recounts a scientific pilgrimage to the famous laboratories where research in physics is in progress, including radiation, matter, astrophysics, weather, and the galaxies. Readable, dependable, it adds one more to the annals of hero days of modern science.

Serious students of sound will find welcome re-

lief in reading Miller's *Anecdotal History of the Science of Sound* from the days of Pythagoras to the inception of the Acoustical Society of America.

Controlled Quantitative Investigation is the theme of *The Development of Physical Thought in America* by Loeb and Adams.

Compton and Allison in their book *X-rays in Theory and Experiment* make the daring claim "Perhaps no single field of investigation has contributed more to our knowledge of atomic structure than has the study of X-rays."

Quantum Mechanics by Dirac is the work of a master in a speculative field of physics. Millikan's *Electrons (+ and -)*, *Protons, Photons, Neutrons, and Cosmic Rays* is the ripe crop from a life of research. Others were Gale: *The Diffraction Grating*; Compton (A. H.): *Recent Developments in Cosmic Rays*; Condon and Shortley: *Theory of Atomic Spectra*; McCrea: *Relativity Physics*; International Conference vol. i, *Nuclear Physics*; Renney: *The Quantum Theory of Valence*; Richmond: *The Dilemma of Modern Physics—Waves or Particles?*; Watson: *Sound*; Stephenson: *Exploring into Physics*.

"PICTURE BOOKS." See LITERATURE, ENGLISH AND AMERICAN.

PILSUDSKI, pīl-soō'tskē, JOSEF CLEMENS. A Polish general and administrator who died at Warsaw, Poland, May 12, 1935. He was born at Zulow in the District of Wilno, Russia, Dec. 5, 1867, of Lithuanian parents, and was educated at the Gymnasium at Wilno, and, later, at the medical school of the University of Kharkov, from which he was expelled for participating in revolutionary activities. He then returned to Wilno where he joined a half-Socialist and half-Nationalist Society of Young Poles, which organization was involved in a plot to assassinate the Czar Alexander III. Although supposed to have been proved innocent Pilsudski was sentenced to five years' penal service in Eastern Siberia.

Upon his return to Poland in 1892, he became one of the leaders of the Polish Socialist Party (P.S.P.). Two years later he founded the *Robotnik* (*The Workman*), a paper of radical tendencies. In 1896, together with Ignace Moscicki and Ignace Daszynski, he represented the Polish Socialists at the Socialist International convention in London. During this period of his life, 1894-1900, he was the beloved of the working classes and the intelligentsia, for "the tenacity of his convictions, for his fearlessness, and for his iron will."

Arrested by the Russian Government at the secret offices of *Robotnik* in Lodz in May, 1900, he was thrown into the dreaded tenth pavilion of the Warsaw Citadel, from which it was said no prisoner ever escaped. Feigning insanity, he was transferred to St. Nicholas Hospital in St. Petersburg, from which he escaped by means of a forged medical certificate issued by a Polish doctor. In 1902, he returned from London, whence he had fled, to Kharkov, now under more liberal Austrian rule.

At the time of the Russo-Japanese War, Pilsudski tried to interest the Japanese Government in a Polish insurrection but failed. During the Russian Revolution of 1905-06, he organized bands of armed volunteers in order to start an uprising, but was unsuccessful. It was now that he began to put into being his dream of a private Polish army, and he began his activities among the refugees from the Russian provinces. An officers' school was established at Lwow and branches of sharpshooters

(Strzelec) formed throughout Galicia. At the outbreak of the World War in 1914, his 10,000 troops were incorporated into two legions and offered to Austria. Upon the evacuation of Warsaw by the Russians, Pilsudski started work for an independent Poland.

In September, 1916, he resigned his command of the Polish Army as a protest against the interference of German and Austrian authorities in Polish territory. On Nov. 16, 1916, the Central Powers recognized Russian Poland as a separate nation, and offered Pilsudski the position of head of the Military Commission, which he accepted. Within a short time he formed the semi-secret Polish Military Society, *Polska Organizacja Wojskowa* ("P.O.W."), which spread throughout the country.

In July, 1917, because of the refusal of his legions to take the oath of "fraternity of arms with Germany and Austria," Pilsudski was imprisoned in the fortress of Magdeburg, where he remained until 1918 when released by the German revolutionary forces. On November 4 of that year, he arrived in Warsaw and aided by the Polish Military Society, completed the disarmament of the armies of occupation. He was now vested with dictatorial powers, for the Regency Council established by the Germans resigned in his favor, and all the military organizations submitted to him. He was unanimously elected chief of state and generalissimo of the Polish Army which in 1920 proclaimed him first Marshal of Poland. In 1919, he was elected Provisional President. As commander-in-chief of the Army he directed the fighting of 1919-20 with the Lithuanians, the Ukrainians under General Petlura, and the Bolsheviks. These struggles resulted in the incorporation of the Wilno (Vilna) region and Eastern Galicia in the new Polish state and the repulse of the Bolshevik invasion at the gates of Warsaw in August, 1920.

Pilsudski's work for Poland temporarily ended in 1922, for the Polish Constitution, accepted by Parliament in 1921, gave the President very little power and curtailed his military functions to those of a titular commander-in-chief debarred from leading the army in war. He did not stand for reelection, but retired to private life, where he devoted himself to literary work, writing a number of historical books, of which the best known is *Rok 1920 (The Year 1920)* (1925), an account of his Bolshevik campaign.

Although in retirement, Pilsudski retained his active interest in political affairs. He continued to insist that the safety of Poland depended upon the complete independence of the commander-in-chief of the army from political control, in peace as well as in war. With the formation of the Witos Cabinet on May 10, 1926, it was rumored that Pilsudski's Nationalist opponents were about to triumph and that the head of the armed forces would be made subordinate to the Minister of War. On May 12 Pilsudski suddenly assembled a body of troops and marched into Warsaw. The Witos Government, which proclaimed him a rebel, was ousted after two days of heavy street fighting.

A cabinet was formed under Charles Bartel in which Pilsudski became Minister of War. Now began his long and powerful control of the Polish Government and the formation of the so-called constitutional dictatorship. Offered the presidency by Parliament on May 31, he refused, but in June became commander-in-chief of the army with powers independent of Parliament or the cabinet. Although admittedly dictator, he refrained from assuming absolute power, and opposition to him in

Parliament continued strongly in evidence. In October, the Opposition caused the resignation of the Bartel ministry and Pilsudski himself assumed the Premiership.

Until 1928 he retained the post of Premier, but illness in May of that year caused the break up of his forces in Parliament and on June 26 he forced the resignation of his cabinet, he himself resigning the following day. In the new ministry of Bartel he retained the post of Minister of War, and it was evident that the dictator was controlling from behind the scenes. On Aug. 25, 1930, he assumed full dictatorial powers and took the office of Premier. With a majority in Parliament, his adherents were for the first time squarely faced with the responsibility for a constructive political and economic programme. On December 4, in advance of the opening of the new Parliament, he resigned as Premier, but still kept the all-important post of War Minister in the cabinet of Walery Slawek. Again he was the power behind the throne. He now began to agitate for the revision of the Constitution, which he claimed was outmoded, and the balancing of the budget. The Slawek cabinet, weakened because of dissension with Pilsudski concerning the budget and increased military appropriations, resigned on May 26, 1931, and Col. Aleksander Prystor formed a new cabinet. In the years that followed, the steady undermining of parliamentary government continued. On May 16, 1934, a new cabinet was formed under Leon Kozłowski, Pilsudski still retaining control of the War Department.

Pilsudski's rule of Poland was often referred to as "a dictatorship by proxy," and for almost 10 years he was the unqualified ruler of Poland, even though he did not always hold the premiership or control Parliament. As Minister of War and head of the army he reserved to himself the formation of Poland's foreign policy and contended that without a strong military defense and a clearcut foreign policy, Poland would not exist. Recent constitutional reforms had given virtually limitless power to the president, and it was believed that had he lived he would have assumed that office. It was ever his dream that Poland should return to that "golden age" of the 14th to 16th centuries, and it was his qualities of leadership, determination, and skilled diplomacy that were instrumental in bringing about the existence of Poland as a political unity.

Besides frequent contributions to the Polish press, he wrote: *Illegal Prints* (1903); *Practical Problems of the Revolution in Russian Poland* (1910); *Military Geography of the Polish Kingdom* (1910); *History of the Fighting Organization* (1910); *Outline History of January Insurrection 1863* (1912); *January 22nd, 1863 (Polish Insurrection)* (1912); *On the Balkan War of 1912* (1914); *My First Fights (Polish Legion, 1914)* (1917); *Historical Corrections* (1931); *Memories of a Polish Revolutionist and Soldier* (1931).

PITTSBURGH, UNIVERSITY OF. A nonsectarian institution of higher education for men and women in Pittsburgh, Pa., founded in 1787. The total autumn enrollment for 1935 was 10,412, distributed as follows: The College, 2239; engineering, 464; mines, 122; business administration, 622; education, 941; off-campus centres, 871; graduate school, 1925; downtown division, 2344; medicine, 263; law, 233; pharmacy, 188; dentistry, 191; retail training, 9. The extension division enrollment was 1219. The 1935 summer session enrollment was

2407. There were 964 members of the faculty (including fellows of Mellon Institute of Industrial Research) during the year which closed June 30, 1935. The amount of endowment for the year ending June 30, 1935, was \$2,176,963, and the income was \$80,003. The library contained 188,879 volumes. Extensive departments of governmental service and social work were established. The Stephen Foster Memorial and the Heinz Memorial Chapel were being built. Chancellor, John G. Bowman, LL.D.

PIUS XI. See ROMAN CATHOLIC CHURCH.

PLATINUM AND ALLIED METALS.

According to an advance summary furnished by the U. S. Bureau of Mines, platinum refineries in the United States reported purchases of domestic crude platinum from the following sources in 1934: Alaska, 2190 oz.; California, 361 oz.; Oregon, 132 oz.; Washington, 1 oz.; and unspecified, 137 oz.—a total of 2821 oz. (508 oz. in 1933). Refiners in the United States also reported purchases of 51,810 oz. (58,897 oz. in 1933) of foreign crude platinum—12 oz. from Canada, 47,871 oz. from Colombia, 3595 oz. from South Africa, and 332 oz. unspecified. Reports from refiners of crude platinum, gold bullion, and copper indicate that 47,274 oz. of platinum metals were recovered in the United States from these sources in 1934, a decrease of 8.3 per cent compared with 1933.

Refiners reported the following average prices per oz. for refined platinum and allied metals in 1933 and 1934:

<i>Metal</i>	<i>1933</i>	<i>1934</i>
Platinum (ounce)	\$30 75	\$34 50
Palladium do	18.30	22 54
Iridium do	54 30	54.74
Osmium do	56 00	63 00
Rhodium do	43 50	44 10
Ruthenium do	41.75	37 40

The sales of platinum metals by refiners in the United States decreased from 107,821 oz. in 1933 to 95,904 oz. in 1934. A decrease from 11,149 oz. in 1933 to 6776 oz. in 1934 in the sales of platinum, and an increase from 15,946 oz. in 1933 to 19,555 oz. in 1934 in the sales of platinum to the dental industry are noteworthy. The sales of platinum to the jewelry industry decreased substantially—from 41,263 oz. in 1933 to 32,959 oz. in 1934.

POLAND. A central European republic, established Nov. 9, 1918. Capital, Warsaw (Warszawa).

Area and Population. With an area of 149,957 square miles, Poland had a population estimated at 33,024,000 on Jan. 1, 1934 (32,120,020 at the 1931 census). About 24.6 per cent of the people lived in urban communities. Living births in 1934 numbered 881,615; deaths, 479,684; marriages, 277,255; emigrations, 42,533. Estimated populations of the chief cities in 1934 were: Warsaw (Warszawa), 1,200,000; Łódź, 591,000; Lwów (Lemberg), 316,000; Poznań (Posen), 251,000; Kraków, 229,000; Wilno (Vilna), 207,000; Katowice, 129,000; Czeszochowa, 125,000; Bydgoszcz (Bromberg), 122,000; Gdynia (June 1, 1935), 53,192. In 1932 74.9 per cent of the population was Roman Catholic, 12.5 per cent Russian Orthodox, 9.6 per cent Jewish, and 2.7 per cent Protestant.

Education. Elementary education is free and compulsory, but about 32 per cent of the population remains illiterate. The school enrollment in 1934-35 was: Elementary, 4,654,796; secondary, 166,085; professional, 83,483; and university (1933-34), 49,727.

Production. The 1931 census showed 63.8 per cent of the working population engaged in agriculture, forestry, and fishing, and 15.4 per cent in

trade and transport. A total of 45,855,000 acres (48 per cent of the total area) was suitable for cultivation, 16,012,000 acres were meadow, and 20,565,000 acres were under forests. Production of the chief crops in 1934 was (in thousands of units): Wheat, 76,440 bu.; rye, 254,476 bu.; barley, 66,719 bu.; oats, 175,730 bu.; corn, 2976 bu.; potatoes, 1,229,807 bu.; sugar beets, 2572 metric tons; beet sugar (1934-35), 344 metric tons; clover, 1918 lb. Poland ranks second among flax-producing countries; the 1934 crop totaled 30,820 metric tons. Livestock on June 30, 1935, included 3,762,000 horses, 9,696,000 cattle, 6,703,000 swine, 2,783,000 sheep, and 354,000 goats. Thirty-eight per cent of the forest area is owned by the state. Exports of timber and wood products average about 20 per cent of the total Polish exports, the value in 1934 being 180,000,000 zlotys (155,000,000 in 1933). Deep-sea fisheries yielded 16,851,000 kilograms of fish in 1934 (14,629,000 in 1933).

Mineral and metallurgical production in 1934 was (in 1000 units—metric tons, except as indicated): Coal, 29,233; petroleum, 3910 bbl.; natural gas, 468,949 cu. meters; iron ore, 247.4; salt, 372.2; crude potash, 301.5; petroleum products, 484.8; pig iron, 382; steel, 856; rolled iron and steel, 619; lead, 10.3; zinc, 92.9. On Oct. 1, 1935, 440,722 persons were employed in manufacturing, 92,774 in mining, 38,681 in smelting, and 134,491 in public works. Textile factories employed 141,926 persons; metal foundries, 69,806; minerals, 53,641; food, 45,661; lumber, 37,936; chemicals, 34,316; paper, 12,749.

Foreign Trade. Imports for consumption in 1934 were valued at 798,760,000 zlotys (826,994,000 in 1933) and exports of Polish products at 975,342,000 zlotys (959,643,000 in 1933). The United States furnished 15.2 per cent of the value of Poland's 1934 imports (13.3 per cent in 1933); Germany, 13.6 (17.6); United Kingdom, 10.8 (10); France, 5.8 (6.8). Of the 1934 exports, the United Kingdom took 19.7 per cent (19.2 in 1933); Germany, 16.5 (17.5); Austria, 5.9 (5.8); and the United States, 2.3 (1.6).

Leading 1934 imports were (in 1000 U. S. gold dollars): Raw cotton, 12,462; metals and manufactures, 9402; machinery, 6474; greasy wool, 4590; hides and skins, 3672; fruits and nuts, 3121. The leading exports (in 1000 gold dollars) were: Wood and its manufactures, 19,911; coal, 17,724; metals and their manufactures, 12,991; bacon, 5243; rye, 4975; barley, 4027.

Imports in 1935 totaled 859,572,000 zlotys; exports, 925,943,000 zlotys. United States statistics for 1935 showed imports from Poland and Danzig of \$9,811,312 (\$5,648,362 in 1934) and exports to Poland and Danzig of \$24,485,703 (\$18,873,232 in 1934).

Finance. Budget estimates for the fiscal year ending Mar. 31, 1936, placed receipts at 2,016,000,000 zlotys and expenditures at 2,168,000,000 zlotys. Actual returns for 1934-35 were: Receipts, 2,115,000,000 zlotys; expenditures, 2,176,000,000 zlotys, for 1933-34, 1,869,000,000 and 2,206,000,000 zlotys, respectively. The public debt as of July 1, 1935, amounted to 4,641,847,000 zlotys (foreign, 3,160,725,000; domestic, 1,481,122,000 zlotys), compared with 4,303,672,000 on Jan. 1, 1934. The zloty (par, \$0.1899 in 1935) exchanged at an average of \$0.1118 in 1932, \$0.1441 in 1933, and \$0.1885 in 1934.

Communications. The state railways in 1933 had 12,680 miles of line and private and communal light railways had 909 miles. In 1933 the state lines

carried 138,171,000 passengers and 48,825,000 metric tons of freight, the gross receipts totaling 878,-624,000 zlotys. During 1934 the state railways averaged 11,716 15-ton carloads a day, compared with 10,620 in 1933. The highways in 1935 extended 208,819 miles, of which 36,205 miles were surfaced. The air lines during 1934 carried 18,198 passengers, 404,283 lb. of baggage, 393,910 lb of merchandise, and 63,888 lb. of mail. The Polish merchant marine in 1935 consisted of 37 steamers of 60,689 registered tons capacity and 20 motor ships of 3611 tons. During 1934 4592 vessels of 4,142,000 net register tons capacity entered the port of Gdynia, while 4880 vessels of 3,175,000 tons entered the rival port of Danzig (q.v.). Gdynia ranked fourth among the ports of continental Europe in the volume of traffic handled during 1934. Poland's new transatlantic liner, the *Pilsudski*, completed her maiden trip to New York on Sept. 24, 1935.

Government. The Constitution of Apr. 23, 1935, vested extensive powers in a President, chosen by popular vote from two nominees—one selected by the retiring President and the other by 75 electors (50 appointed by the Diet and 25 by the Senate and the highest state officials). In case the President refrains from nominating a candidate, the other nominee is automatically elected for the term of seven years. The President was empowered to appoint and dismiss the Prime Minister, to issue decrees with the force of law when the Diet (Sejm) was dissolved, and to dissolve the Diet and the Senate. The Diet consisted of 208 members, chosen by voters (male and female) over 24 years of age from lists of nominees selected by special bodies including representatives of various political, commercial, professional, educational, and other groups. The Senate was composed of 96 members, one-third chosen by the President and the remaining two-thirds elected by voters over 30 years of age who have been decorated for service to the state, have obtained an advanced education, or serve on certain public or semi-public agencies. Members of both the Diet and the Senate serve for five years. President in 1935, Ignace Moscicki (non-partisan), reelected May 8, 1933. Premier at the beginning of the year, Leon Kozłowski.

II. HISTORY

Domestic Affairs. The death of Marshal Josef Pilsudski (q.v.) in Warsaw on May 12, 1935, eliminated from the Polish scene the man who more than any other was responsible for the establishment of the Polish Republic. He shaped the course of the nation in domestic and foreign affairs throughout the postwar period, ruling as virtual dictator after crushing the opposition elements in his coup d'état of 1926. Amid impressive ceremonies and nation-wide homage, the body was buried with the Polish Kings of former centuries in the crypt of Wawel Cathedral at Cracow.

The passing of Pilsudski marked a turning point in Poland's constitutional and political history. It occurred within three weeks of the proclamation on April 23 of the new Polish Constitution, which after years of debate received final approval in the Sejm on March 20. Provisions of the new fundamental law are described under *Government*. The Constitution was drafted largely under Pilsudski's guidance and inspiration, and it embodied his conception of a government dominated by a strong executive with parliament relegated to a position of complete inferiority. In effect, it legalized the extra-constitutional position assumed by the Mar-

shal and his adherents after they seized power in 1926 and placed a definite check upon the activities of political parties.

On Mar. 28, 1935, the Kozłowski Ministry had been replaced by a cabinet under Col. Walery Slawek, formed for the express purpose of putting the new Constitution into effect. Five days before Pilsudski died, the Slawek Cabinet submitted to Parliament new electoral laws carrying into effect the anti-democratic principles of the new Constitution. Passed by the Sejm on June 28 and by the Senate six days later, the measures established an electoral system under which the principle of party representation in Parliament was abolished. The country was divided into 104 constituencies. In each constituency four candidates were nominated by municipal councils, chambers of commerce, labor federations, and professional groups. The voters were permitted to choose two out of each four candidates to represent them in the Sejm. The right to vote for candidates for the Sejm was granted to some 20,000,000 citizens, but the privilege of voting for members of the Senate was restricted to about 400,000. Of the latter, 70,000 represented persons decorated by the state, 200,000 had attained certain educational requirements, and 130,000 represented certain economic groups and autonomous government administrations. Following passage of these measures, Parliament was dissolved on July 10 and new elections were called.

The four candidates for the Sejm in each constituency were selected on August 14 by electoral committees composed of representatives of municipalities, and of commercial, labor, social, and professional groups. Local judges presided over the various committees and the committee proceedings were supervised by commissioners. With both judges and commissioners under the control of the government, it was not surprising to find that the great majority of candidates were members of the government bloc or sympathetic to it. The illiberal nature of the Constitution and the electoral laws led most of the Opposition groups to boycott the elections, held for the Sejm on September 8 and for the Senate on September 15. With only 46.5 per cent of the qualified electorate voting, as compared with 74.8 per cent at the 1930 election, the government bloc secured 190 seats out of the 208 seats in the Sejm. Only 60 per cent of the qualified voters participated in the Senate elections and 60 of the 64 Senators elected were affiliated with the government bloc. President Moscicki later appointed 32 additional Senators.

With his primary task accomplished, Premier Slawek handed in the resignation of his ministry on October 12. President Moscicki called upon Marjan Zyndram Koscialkowski to assume the Premiership and the latter succeeded in forming a cabinet the following day. The composition of the new ministry was significant as marking a break with Marshal Pilsudski's policy of entrusting most of the cabinet posts to military men who served under him in 1918-19 against the Germans and the Russians. In place of members of the so-called "Colonels" who had governed Poland for six years, Premier Koscialkowski named Eugen Kwiatkowski as Deputy Premier and Finance Minister and Gen. Roman Goerecki as Minister of Commerce and Industry. Otherwise the cabinet remained unchanged, with Col. Josef Beck as Foreign Minister and Marshal Pilsudski's selection, Gen. Theodore Addeus Kasprzycki, as Min-

ister of War. Just before his death Pilsudski had selected General Kasprzycki to succeed him as Minister of War and General Rydz-Smigly to follow him in the equally important post of Inspector General of the army.

In a speech outlining his programme delivered on October 24 Premier Kosciakowski made it plain that the major objective of his government was to rehabilitate the nation economically and financially. The world economic depression, and particularly the attendant low prices for farm products, had wrought havoc within the economic structure, depressing the standard of living of the peasantry and reducing purchasing power with consequent severe curtailment of the demand for industrial products. Budget deficits had mounted throughout the depression, despite repeated economies and new taxes. The Premier undertook to balance the budget and maintain the zloty at its existing level (about 19 cents) by further drastic economies, by an increase in the income tax, and by an extraordinary tax ranging from 7 to 20 per cent on all government salaries. He also pledged his government to hasten the reconstruction of the agrarian system, increase industrial production and eradicate unhealthy monopolies established by the industrial cartels, divide the national income on a more equitable basis, reorganize the administration and eliminate bureaucracy, and readjust the collection of tax arrears.

At the same time the Kosciakowski Government undertook to establish closer contact with the nation than had its predecessors. The Premier immediately after his appointment called the first official press conference in nearly a decade and invited the Opposition press to send its representatives. In line with this step was the announcement by former Premier Slawek on October 30 of the dissolution of the Pilsudski party as a formal political organization. In order to put his economic programme into effect, Premier Kosciakowski obtained from Parliament on November 8 authority to issue up to Jan. 15, 1936, decrees relating to economic and financial matters with the binding force of law. He used this power during the remainder of the year to put into effect his income tax and salary tax proposals and to inaugurate a large-scale offensive against the rigid and artificial industrial price structure. The dissolution of 30 cartels, comprising mostly iron, petroleum, and paper wholesale dealers, was decreed. Prices of sugar, coal, and other commodities were reduced and cuts in railway freight rates were announced for early in 1936. Other decrees modified interest rates and dates of payment of mortgage loans, lowered the interest rate on arrears in private legal proceedings, regulated the sugar market and the production of sugar beets, and raised the tax on capital and rents.

An important political achievement of Premier Kosciakowski during the year was the reconciliation of the Ukrainian minority with the government, after years of underground warfare between them. On the other hand his administration was marred during the autumn and winter months by repeated anti-Semitic outbreaks, particularly in Warsaw. Despite government efforts to check violence, it was estimated that the anti-Jewish riots cost more than a score of lives and resulted in injuries to between 300 and 400. Numerous Jewish shops were plundered. See *Jews*.

Foreign Relations. The death of Marshal Pilsudski, removing his dominating influence over Polish foreign policy, introduced a new element

of uncertainty into European diplomatic calculations at a time when the drift toward war appeared to be nearing its culmination. Pilsudski's diplomacy had been dominated by two primary motives—hatred of Russia and of communism and fear that France might seek to avert war with Germany by sacrificing the Franco-Polish alliance and permitting the Reich to seize the Polish Corridor and Polish Silesia. By the conclusion of the 10-year German-Polish non-aggression pact of Jan. 26, 1934, Pilsudski had won Hitler's pledge to respect the Polish boundary for a decade, while Hitler had driven a powerful wedge between Poland and France. The following year was marked by an increasingly pro-German orientation of Polish foreign policy, but apparently without a definite commitment by the Warsaw Government.

The conclusion of the Franco-Soviet alliance on May 2, 1935, greatly increased Poland's peril. She was almost certain to be the battleground of the threatened German-Soviet war. Poland could not aid the Reich to defeat the Soviet Union without exposing herself to the future appropriation of the Corridor by an all-powerful Germany. A Franco-Soviet victory over Germany, with Polish aid, would increase the danger of Communist penetration in Poland. Nor could Poland remain neutral in a Russo-German struggle without inviting almost certain invasion from one side or the other. Thus Warsaw in 1935 became the chief battleground of German and Franco-Soviet diplomacy, while within the country there was developing a struggle between the pro-Soviet, pro-French, and pro-German cliques, previously held under control by Marshal Pilsudski.

The continuance in office during 1935 of Col. Josef Beck, Pilsudski's choice for Foreign Minister, indicated that the Marshal's policy of keeping free of military combinations, while cultivating friendly relations with Germany, would be followed for the time being. Poland rejected the Franco-Soviet proposal for a multilateral treaty guaranteeing the territorial status quo in Eastern Europe when Capt. Anthony Eden, British Lord Privy Seal, visited Warsaw on April 1 in support of the proposal. The Poles feared the treaty would only increase the danger that Poland would be the cockpit of contending armies and that it would arouse German resentment. Nevertheless the Polish Foreign Office gave active support to the system of collective security in Europe established under the League of Nations Covenant, and joined in the application of economic and financial sanctions against Italy in November. At the same time Poland continued to treat as non-existent the obligations toward her national minorities which were formally repudiated at Geneva in 1934.

While Polish relations with Germany during the year were in general friendly, there was repeated friction over Nazi activities in Danzig (q.v.) and the treatment of Poles in Germany. Repeated moves toward the liquidation of the long-standing Polish-Lithuanian tension over Vilna were made on both sides during the year. However the revelation late in 1935 that high Lithuanian officials had supported the Ukrainian terrorist campaign in Poland which culminated in the assassination of Minister of Interior Pieracki in 1934 put a damper upon these negotiations. See *LITHUANIA* under *History*. The year also witnessed the continued development of serious friction with Czechoslovakia over the activities of the Polish minority in the Czechoslovak border district of Teschen. Poland took advantage of the disturbed

European situation to renew her claims to this district, in dispute since the establishment of the two republics. The acute state of Polish-Czechoslovak relations was particularly significant in view of the active efforts by influential groups in Poland, Germany, and Hungary to form an alliance designed to defeat the Soviet Union and destroy Czechoslovakia. The Czechoslovak territories would then be divided among the three powers.

See CZECHOSLOVAKIA, DANZIG, FRANCE, GERMANY, GREAT BRITAIN, HUNGARY, LITHUANIA, RUMANIA, and UNION OF SOVIET SOCIALIST REPUBLICS under *History*; LEAGUE OF NATIONS.

POLAR RESEARCH. Antarctic. An exploit which made the year 1935 a notable one in the history of polar exploration was the 2100-mile aeroplane flight made by Lincoln Ellsworth and his pilot, Herbert Hollick-Kenyon, across a previously unexplored sector of the Antarctic Continent. Ellsworth had made two efforts to execute this plan in 1934 (see 1934 YEAR BOOK, p. 582), but was foiled by an accident to his plane and bad weather. Undaunted, he returned to the attack in November, 1935, and landed his aeroplane, the *Polar Star*, on Dundee Island in the Antarctic Archipelago on November 12. From there he prepared to span the Antarctic Continent to Admiral Byrd's former base at the Bay of Whales on the Ross Sea.

A start was made on November 20, but a leak in the plane's fuel line forced him to turn back after three hours of flying. A second start on the following day took Ellsworth and his pilot across the Weddell Sea to Hearst Land on the edge of Antarctica. At the border of Hearst Land and southward of Cape Eielson the explorers discovered a great mountain range rising to nearly 12,000 feet and extending in a northwest-southeast direction. Great cloud banks forced them to turn back after penetrating south of 71 degrees between 65 and 66 degrees west longitude. They returned to Dundee Island after 10½ hours' flying, having proved that the great mountain chain of which Graham Land is a part continued on the mainland.

The third flight began on November 23. The *Polar Star's* wireless communications to the base ship, *Wyatt Earp*, at Dundee Island ended mysteriously eight hours later, after Ellsworth had reported excellent progress across one-third of the distance to the Ross Sea. No further word was heard from the explorers until Jan. 16, 1936, when the British research ship *Discovery II* entered the Bay of Whales and found Ellsworth and Hollick-Kenyon safe at Admiral Byrd's base camp. The details of one of the most important and sensational polar explorations on record then became available.

On the first day of the flight the *Polar Star* crossed the mountain range in Hearst Land sighted on the previous flight and continued over a high plateau, broken at intervals by isolated mountains. At 5:45 p.m., with another mountain range in sight, Ellsworth dropped the American flag on hitherto unclaimed territory. From their aerial vantage point, the flyers saw that the new range extended some 75 miles, with peaks rising to about 13,000 feet. Bad visibility forced them to make their first landing after 9 p.m. on November 23, at Lat. 79 degrees 12 minutes S., and Long. 104 degrees 10 minutes W. On the following day at 5 p.m. the weather cleared temporarily and they took off again, only to be forced down in half an hour by bad visibility. After waiting three days in their tent for the weather to moderate, they took off

again on November 27. The fickle weather allowed them only 50 minutes of clear visibility and they landed just in time to escape a raging blizzard. It was December 4 before they were able to continue their flight. Again poor visibility led them to land within an hour to fix their position. They were then at Lat. 79 degrees 17 minutes S. and Long. 153 degrees 16 minutes W.

On December 5 they flew on toward Little America again. Almost within sight of the Bay of Whales their fuel gave out and they landed at Lat. 78 degrees 45 minutes S. and Long. 183 degrees 36 minutes W. After remaining four days with the plane in the hope of establishing wireless communication with their base ship, they packed their belongings on a handsled and walked the remaining 25 miles to Little America, where they arrived December 9. They had proved definitely that the Antarctic was a single great continent. They had also successfully inaugurated a new method of polar exploration—that of cutting loose from their base and landing to await clear weather whenever storms or clouds arose. It seemed likely that through the extension of this technique, the remaining mysteries of Antarctica would soon be solved.

Following its extensive explorations during the summer of 1934 in that section of Antarctic bordering the Ross Sea (see 1934 YEAR BOOK, p. 582), Adm. Richard E. Byrd's second Antarctic expedition left Little America safely on Feb. 6, 1935. The only other land expedition active in Antarctica during 1935 was the British Graham Land Expedition, headed by J. R. Rymill, which established a base hut on an island five miles off the coast of Graham Land early in 1935. The 14 members of the party planned to spend two years exploring the 1000-mile coastline between Charcot Land and Luitpold Land. Bad ice conditions prevented the expedition from carrying out its full plans during the summer season of 1935 but surveys and scientific work were carried on from Beascochea Bay to Cape Evensen and preparations were made for the main explorations in 1936.

Captain Michelsen of the Norwegian whaler-ship *Thorshavn* reported the discovery on Feb. 20, 1935, of new land in the Australian sector of the Antarctic at Lat. 67 degrees 50 minutes S. and Long. 80 degrees 45 minutes E. The ship followed the shore line as far as Lat. 68 degrees 29 minutes S. and Long. 78 degrees 36 minutes E. At this point a party went ashore, hoisted the Norwegian flag, and took photographs and specimens of soil. The new land was called Ingrid Christensen's Land after the wife of the owner of the ship.

Two British Royal research ships, the *Discovery II* and the *William Scoresby*, continued during 1935 their studies of the numbers, distribution, and life history of whales in the Antarctic seas. The *William Scoresby* returned to London from a seven-months' voyage to the Antarctic in May, 1935, and sailed for her fifth trip to the Antarctic again in October. The main objective of her voyages was to mark the whales in order to determine their movements. During the fourth trip between 700 and 800 whales were marked by long bullets from a gun in the bow of the ship. These marked bullets imbedded themselves in the flesh or muscle of the whale. When a marked whale is afterwards killed the bullet is found and returned to the ship's scientists, who offered a reward of £1 for each bullet recovered.

The *Discovery II* returned to London early in June after her third trip to the Antarctic, cover-

ing a period of 20 months. The crew and scientists on board carried out extensive studies of the great seasonal changes in the water movements in the Antarctic seas in order to trace the circulation of the marine animals and plants on which the whales live. The Pacific sector of the Antarctic waters were studied to determine the practicability of establishing a whale sanctuary there; the various dependencies of the Falkland Islands were mapped; and running surveys were made of the South Sandwich and South Orkneys island groups. Early in October the *Discovery II*, with her crew of 50 men, left London for a fourth voyage to the Antarctic.

Arctic. The Soviet Government, continuing during 1935 its large-scale explorations and scientific studies of the land and water areas between the White and Bering Seas north of the Arctic Circle, made important contributions to the existing knowledge of this vast region. The object of these scientific efforts was to compile information which would aid in the economic development of the Soviet Arctic and in the establishment of regular shipping services between Murmansk and Vladivostok to supplement the Transsiberian Railroad. As a result of Soviet polar research in previous years, ordinary freight vessels traversed the Northern Sea Route in both directions during the summer of 1935. Two freighters reached Kamchatka from Murmansk early in September and a week later two other vessels arrived at Murmansk from Vladivostok. All four vessels unloaded cargo and passengers at various new Soviet ports along the Siberian coast, the principal one being Igarka, a city of 30,000 inhabitants, at the mouth of the Yenisei River.

Of the Soviet explorations during 1935, the most important were those carried out by an expedition on the icebreaker *Sadko*, headed by Prof. George Ushakov. Going north into the Arctic ice pack to the west of Svalbard early in the summer, the *Sadko* slowly worked its way eastward in an effort to trace the warm waters of the Gulf Stream, which rise to the surface after passing Svalbard and markedly influence ice conditions. They found that the warm currents penetrated to Barents Sea between North Cape and Svalbard and also that after skirting Svalbard on the north, other warm currents flowed south into the Barents Sea between Svalbard and Franz Josef Land (Fridtjof Nansen Land) and then on into the Kara Sea between Franz Josef Land and North Land. Early in September the expedition discovered a previously unknown island east of Franz Josef Land at Lat. 80 degrees 51 minutes N. and Long. 75 degrees 25 minutes E. This oval-shaped island, about 11 miles wide and 28 miles long, was named Ushakov Island after the leader of the expedition. Five days later the *Sadko's* crew reported the discovery of three smaller islands near Komsomolets Island, the northernmost of the North Land group. Soundings taken from the ship indicated that all four islands were peaks of a submerged mountain chain to the northeast of Barents Sea and north of the Kara Sea, which formed a barrier preventing the southward movement into these waters of the heavier Arctic ice pack.

Returning to Archangel on September 29, Ushakov declared that the data obtained on the 85-day voyage of the *Sadko* permitted accurate prediction of ice formation in these regions for the first time. Supplementary data bearing out these conclusions were collected by another group of scientists aboard the icebreaker *Malygin* who conducted explora-

tions in this region and discovered six islands in the centre of the Kara Sea. An unsuccessful search for the mysterious Andreyev Land, supposed to exist somewhere northwest of Wrangel Island, was made by a party of Soviet airmen and scientists. The pilot V. S. Molokov reported that he had flown as far north as Lat. 73 degrees with several scientists without finding land. They found, however, a vast expanse of unbreakable and immovable ice, which strengthened the belief that the ice was held in position by islands situated north of the 73d parallel.

Three Soviet aviators surveying a proposed air route at the northeastern tip of Siberia disappeared after leaving Cape Wellen on Dec. 19, 1935. Another Soviet scientist was reported to have been lost in November while studying the migrations of seals and other sea animals on the ice floes at the entrance to the White Sea. See UNION OF SOVIET SOCIALIST REPUBLICS under *History*.

In Greenland and the Svalbard Archipelago a number of British exploring parties were active during the summer of 1935. A party headed by L. R. Wager arrived on the east coast of Greenland early in July. On August 7 six members of the expedition left Irminger Fjord and nine days later reached the Watkins Mountains, 100 miles inland, which were first seen by H. G. Watkins of the British Arctic Air Route Expedition during an aeroplane survey flight in 1930. On August 17 the party reached the summit of the highest mountain in the range, which rose to 12,250 feet. After making surveys, photographs, and observations, and climbing a number of other mountains, the party returned to the ship on August 22. Five men and two women under Mr. Wager were then landed at Kangerdluak, where they spent the winter, while the remainder of the expedition under Augustine Courtauld returned to England.

After spending the winter of 1934-35 at Etah, West Greenland, the British Ellesmere Land Expedition under Dr. Noel Humphreys divided into three parties for the summer's work in 1935. A. W. Moore and H. W. Stallworthy sledged from Fort Conger across the United States Range into Grant Land to Lat. 82 degrees 25 minutes N. Still further north they saw a great range of mountains, rising to an altitude of about 10,000 feet, which they named provisionally the British Empire Range. The second party consisted of Edward Shackleton and Robert Bentham, who did geological and survey work in the vicinity of Scoresby Bay. Meanwhile Dr. Humphreys and Mr. Haig-Thomas explored another section of the interior of Ellesmere Island but were unable to cross Grinnell Land due to the refusal of their Eskimos to accompany them. Leaving Greenland on board the Danish ship *Dannebrog* in August, the expedition reached home in October. It also had to its credit a crossing of the Greenland ice cap from Etah to Thule.

The Oxford University Arctic Expedition under A. R. Glen early in August established a winter base at Brandy Bay, on the north shore of North-East Land, the northernmost island of the Svalbard (Spitsbergen) Archipelago. Members of the party explored parts of the interior, surveyed the north coast of North-East Land, and established stations for meteorological and other scientific studies during the winter. They planned to visit Giles White Island, where the Andrée remains were discovered, and sought also to discover the fate of the Schroeder-Stranz expedition, which disappeared in 1912. Capt. Robert Bartlett made his ninth voyage to Greenland with a party of Ameri-

Statute Miles

POLITICAL AND SOCIAL SCIENCE. THE AMERICAN ACADEMY OF. A national forum for the discussion of political and social questions, founded in Philadelphia in 1889, and incorporated in 1891. The organization takes no sides upon controversial questions. Its aim is to secure and present reliable information to assist the public in forming an intelligent public opinion. A meeting held on February second discussed "The Federal Program for Economic Security." On February 13, the members and guests of the Academy were addressed by His Excellency, The Ambassador of the Union of Soviet Socialist Republics, Honorable Alexander Antonovich Troyanovsky on "The Foreign Policy of the Soviet Union." The 39th Annual Meeting held April 5 and 6, considered the general subject, "Socialism, Fascism and Democracy." A conference held April 13 was devoted to the topic, "The United States and Latin America." On May 3, Sir Josiah Stamp addressed the Academy on "International Cooperation in Economics and Finance." A meeting held May 23 and 24 dealt with the general topic, "The State Constitution of the Future." On November 29, the Academy was addressed on the subject of "Rising Prices and the Consumer" by Gilbert H. Montague, Esq., Dr. Edwin W. Kemmerer and Mr. Leon Henderson. On December 13, Dr. André Siegfried discussed "The World Challenge to Europe."

The *Annals*, issued bimonthly, is the official organ of the Academy. Each issue is devoted to a particular topic of economic, political, or social importance. Topics considered in 1935 were "Radio: The Fifth Estate"; "Increasing Government Control in Economic Life"; "Pressure Groups and Propaganda"; "Socialism, Fascism and Democracy"; "The State Constitution of the Future"; and "Education for Social Control."

The Academy has established a monograph series, the first of which was a study on *Private Police* with special reference to Pennsylvania, prepared by Dr. J. P. Shalloo.

The Academy has inaugurated also a pamphlet series, the first of which is entitled *Economics of Planning* and is an authorized reprint of a series of articles appearing under the title indicated, in the Manchester (England) Commercial Guardian. The second in the series is entitled *Financing New York City*, by William Whyte.

The officers in 1935 were: President, Ernest Minor Patterson; Secretary, J. P. Lichtenberger; Treasurer, Charles J. Rhoads; Vice Presidents, Herbert Hoover, Carl Kelsey, and Charles G. Haines. Headquarters are at 3457 Walnut Street, Philadelphia, Pennsylvania.

POLITICAL ECONOMY. Subjects in the field of applied economics are treated in this volume under the following heads: **BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; CHILD LABOR; COOPERATION; LABOR ARBITRATION AND CONCILIATION; LABOR LEGISLATION; MINIMUM WAGE; OLD AGE PENSIONS; STRIKES AND LOCKOUTS; UNEMPLOYMENT; WOMEN IN INDUSTRY; WORKMEN'S COMPENSATION.** See also such articles as: **CHILD WELFARE; LABOR, AMERICAN FEDERATION OF; STATISTICS; SO-**

CIALISM; TRADE UNIONS; WELFARE WORK. See also the article on **AGRICULTURE** and the various crops. Further discussions are to be found in articles on the several industries, minerals, public utilities, etc. Books on political science and economics for the general reader are to be found listed in the article **LITERATURE, ENGLISH AND AMERICAN, under Economics and Politics.**

POLITICAL SCIENCE, ACADEMY OF. An international learned society for advancing the political sciences and their application to political, economic, and social problems, founded in 1880 in New York City and incorporated in 1910. Its membership on Dec. 31, 1935, numbered 6692, of whom 7 were honorary members, 220 life members, 5218 individual members, and 1247 subscribing members, chiefly libraries and organizations. At the semi-annual meeting on Apr. 16, 1935, in New York City "Problems of Social Security Legislation in the United States" was discussed.

At the fifty-fifth annual meeting on November 14 the topic under discussion was "The Constitution and Social Progress." The officers for 1935 were: Wesley C. Mitchell, president; Albert Shaw and R. C. McCrea, vice presidents; Parker T. Moon, secretary and editor of publications; George A. Plimpton, treasurer, and Miss Ethel Warner, director and assistant treasurer. Headquarters were in Fayerweather Hall, Columbia University, New York City.

POLO. The thrilling triumph of Greentree, a new team in the national open championship and in the Monty Waterbury Memorial Cup tournament, made the 1935 polo campaign one of the best in years. Greentree's triumph served to bring Thomas Hitchcock, Jr., back to the game and at the close of the season he was playing with all the consummate skill and zest he possessed prior to his fall in 1933. For several years John Hay Whitney's Greentree team had attempted to annex the open title but had never been able to attain this goal until Hitchcock's generalship and aggressiveness gave the team the competitive spirit lacking in other years. With Hitchcock on the team that rode so sensationally through the major tournaments were George H. (Pete) Bostwick, Gerald Balding, and Whitney. As a result of the stylish play, Hitchcock was raised to 10 goals, the lone top man in the game, Balding to 9, and Whitney to five in the handicap ratings of the United States Polo Association in December.

Polo reached a new high in matters of spectator interest as well as player interest. And added attention was focused on the game when the team of the Hurlingham Club of London played on Long Island in the open championship. The team, made up of Capt. M. P. Ansell, Capt. H. C. Walford, Capt. P. B. Sanger, Capt. Humphrey Guinness, and Eric H. Tyrell-Martin, was eliminated early in the tournament, but gained invaluable experience for the Westchester Trophy matches to be played in London in 1936.

The junior championship tournament was staged at Bedminster, N. J., and a new champion was crowned. The Aiken Knights with Bostwick, James Curtis, Winston Guest, and Dunbar Bostwick won the title. The intercollegiate championship was played at Governors Island and Yale's four of Jay Secor, R. E. L. Wilson, Peter Dominick, and Peter Grace won the championship.

The indoor game progressed with the same speed of the outdoor sport and once again the New York Athletic Club four won the senior honors in the East-West series, the team of Billy

Reynolds, Clarence Combs, and Arthur Borden conquering 124th Field Artillery of Chicago, the trio which took the honors in the Sherman Memorial play. Governors Island won the national junior title and Army took the intercollegiate championship. A superb Lawrenceville School three won interscholastic honors.

PORTS AND HARBORS. Port and harbor work is a more or less continual activity throughout the world, and, unless a construction is of a spectacular nature or is technically outstanding, the details of such work are seldom recorded in the engineering journals. One of the most interesting constructions of this kind noted during the year was the new 15,000 ton floating dry dock which is nearing completion. Compared with the huge floating dock at Southampton, England (made floating to avoid costly gravity works but moored in a special basin), this Seattle dock is of relatively unimportant size. In fact, the Southampton Dock is 1200 ft. long and is capable of handling the great 73,000 ton *Queen Mary*. The Seattle construction, however, is notable for the unusual curved-bottom pontoons used in its design. These chambers, which supply the necessary buoyancy to lift a ship in the dock, are usually made flat-bottomed. The Seattle innovation, it is expected, will not only give increased stability but will permit more complete draining of the interior of the pontoons.

PORTUGAL. A republic of southwestern Europe. Capital, Lisbon.

Area and Population. Portugal has an area of 35,582 square miles, including the Azores and Madeira (1196 sq. miles). The estimated population in 1934 was 7,177,000 (6,825,883 at the 1930 census). Living births in 1934 numbered 203,058, deaths, 118,539; marriages, 47,542. The chief cities, with their 1930 populations, are: Lisbon (Lisboa), 594,390; Oporto (Pôrto), 232,280; Coimbra, 27,313; Braga, 26,962. Roman Catholicism is the dominant religion.

Education. Illiteracy increased from 54.7 per cent of the adult population in 1920 to about 60 per cent in 1930. The school attendance in 1932-33 was: Primary, 420,499; secondary, 19,457; university, 6753. There are three universities at Lisbon, Coimbra, and Oporto and a technical university at Lisbon.

Production. Agriculture, the main occupation, is supplemented by fishing, mining, and manufacturing. In 1934 about 2,187,000 acres, or 61 per cent of the total area, was under cultivation and 20 per cent was devoted to meadows. Yields of the chief crops in 1934 were (in thousands of units): Wheat, 20,486 bu.; rye, 4802 bu.; barley, 2346 bu.; oats, 5340 bu.; olive oil (1934-35 season), 7040 gal. In 1933 production of corn was 11,791,000 bu.; potatoes, 22,787,000 bu.; wine, 243,046,000 gal. Mineral production in 1934 was (in 1000 metric tons): Coal, 206,898; iron pyrites, 205,670; wolframite (tungsten ore), 540; cement, 184,146. Output of paper in 1934 was 13,827 metric tons; shoes, 149,891 pairs. Net imports of raw cotton were 47,724,000 lb. The textile industry, the chief manufacturing line, employed about 48,000 operatives in 1934. The sea fisheries in 1934 yielded 216,500 metric tons of fish, valued at 195,900,000 escudos.

Foreign Trade. Imports for consumption in 1934 were valued at 1,960,146,000 escudos (1,905,-

348,000 in 1933) and exports of Portuguese products at 852,705,000 escudos (802,453,000 in 1933). Leading 1934 imports were (in 1000 gold dollars): Gold bullion, 4056; raw and carded cotton, 3974; heavy iron and steel, 3730; coal, coke, and briquets, 3616. Leading exports were (in 1000 gold dollars): Port wine, 4167; canned sardines, 3629; cork and cork products, 3970; woven cotton fabrics, 1096. Imports come mainly from the United Kingdom (22.9 per cent of the total in 1934), Germany, Portuguese colonies, United States, and France. Exports go chiefly to the United Kingdom (26.3 per cent), Germany, Portuguese colonies, France, and the United States.

Including bullion and specie, the 1935 imports totaled 2,218,800,000 escudos; exports, 892,320,000 escudos. Exports to the United States were \$3,644,337 (\$4,137,484 in 1934); imports from the United States, \$10,836,713 (\$7,908,731 in 1934).

Finance. Budget estimates for the fiscal year ended June 30, 1935, were: Receipts, 2,178,000,000 escudos; expenditures, 2,176,000,000 escudos. Closed accounts for 1933-34 showed receipts of 2,015,000,000 escudos (1,953,200,000 in 1932-33) and expenditures of 2,086,900,000 escudos (1,957,200,000 in 1932-33). The funded debt on Apr. 30, 1935, was 6,506,905,000 escudos (external, 3,508,145,000) and the floating debt was 52,522,000 escudos; offsetting credits totaled 678,616,000 escudos. The escudo (par, \$0.0748 in 1935) exchanged at an average of \$0.0320 in 1932, \$0.0392 in 1933, and \$0.0461 in 1934.

Communications. Portugal in 1933 had 2155 miles of railway line (824 miles state-owned), which carried 23,000,000 passengers and 4,372,000 tons of freight. Highways extended about 8900 miles. The opening of an air line between Lisbon and Tangiers in October, 1934, linked the Portuguese capital with Brazil and South America by the Air France Transatlantic line. The merchant fleet on June 30, 1935, consisted of 183 steamers and motor ships of 237,840 gross tons.

Government. The dictatorship established by a military-civilian directorate in 1926 was placed on a corporative basis by the Constitution promulgated Feb. 22, 1933. This provided for a President, elected for seven years by direct suffrage by the "educated heads of families"; a National Assembly of 90 Deputies, elected for four years (45 by direct suffrage and 45 by economic corporations). A Corporative Chamber, attached to the National Assembly, was to report and advise on all bills introduced in the National Assembly before the latter body could act upon them. President in 1935, Gen. Antonio Oscar de Fragoso Carmona, reelected Feb. 17, 1935. Prime Minister, Minister of Finance, and dominant spirit in the dictatorship, Dr. Antonio de Oliveira Salazar.

History. The establishment in Portugal of a corporative state on the Italian model, as provided for in the Constitution adopted Mar. 19, 1933 (see above under *Government*), was carried to virtual completion in 1935. The new National Assembly and the appointive Corporative Chamber had been selected in December, 1934, entirely from the government-controlled National Union, as all the opposition political groups and labor unions had refused to participate (see 1934 YEAR BOOK, p. 585-586). The National Assembly and the Corporative Chamber assembled on Jan. 11, 1935, for a three-months' session. It was the first Parliament to meet since 1926, when General Carmona established his dictatorship. On the same day a Presidential election was called for February 17.

The voting for President was a foregone conclusion. No other candidate ventured to oppose President Carmona, and he was reelected for another seven-year term expiring Apr. 15, 1942.

The Ministry under Dr. Antonio de Oliveira Salazar, the real dictator of Portugal, continued in office, with a minor reorganization on May 11 which elevated Dr. A. R. Monteiro, former Colonial Minister, to the Foreign Office. During an illness of President Carmona in April, Premier Salazar took over all formal Presidential duties in addition to his own. There was no relaxation of the curb placed upon opposition political groups, the press, labor organizations, and other elements antagonistic to the dictatorship. The censorship of local news was extended in September to include all dispatches sent out of the country and all foreign newspaper correspondents were placed under the supervision of a government bureau.

The new Parliament approved the government's plans for a more systematic development and utilization of the economic resources of Portugal and of its extensive colonies. A 15-year programme was adopted providing for the improvement of national defense and the economic reorganization of Portugal at a total cost of 6,500,000,000 escudos. Included in the programme were the extension of railway, highway, and aviation facilities; the improvement of commercial and fishing ports; development of a national electric power system and of telegraph and telephone systems; the irrigation, improvement, and resettlement of agricultural lands; the building of new schools and of other state services; etc. A Council of the Colonial Empire was created to reorganize the colonial governments, speed up the rate of the colonies' economic development, and strengthen their defenses.

Rumors were again current in European capitals during 1935 that negotiations were under way among the great powers to satisfy the land hunger of Germany, Italy, and possibly Japan at the expense of Portugal's rich but practically defenseless colonial empire. On May 16 the government considered it necessary to announce that none of its colonial territory was for sale. On November 16 the Governor of Macao declared that Portugal would not sell Macao (q.v.) or any of its colonies to Japan, that he had taken precautions against Japanese espionage, and that Portugal relied upon Great Britain for aid in the event of aggression upon its colonies. The growing danger from the great militarist powers increased the importance to Portugal of its century-old alliance with Britain. Portugal accordingly supported the British in their dispute with Italy over Ethiopia (q.v.). On October 18 the *Diario de Noticias* of Lisbon announced that the Anglo-Portuguese entente had been extended to include Spain as a result of the visit to Madrid of Foreign Minister Monteiro. See SPAIN under *History*.

PORTUGUESE EAST AFRICA. See MOZAMBIQUE.

PORTUGUESE GUINEA. A Portuguese colony in West Africa. Area, 13,944 sq. miles; population (1930), 364,929. Capital, Bolama; chief port, Bissau. Rice, wax, oil, seeds, ivory, and hides were the chief commercial products. In 1932, imports were valued at 26,246,609 escudos; exports, 36,023,892 escudos (escudo averaged \$0.0320 for 1932). A decree of May 9, 1935, provided that future fiscal years should coincide with the calendar year and approved the budget expenditure of 20,783,803 paper escudos for the 18 months ending

Dec. 31, 1936 (escudo equaled \$0.0449 on June 13, 1935).

PORTUGUESE WEST AFRICA. See ANGOLA.

POST, WILEY. An American aviator, died in an aeroplane accident at Walkpi, near Point Barrow, Alaska, Aug. 15, 1935. He was born in Grand Saline, Tex., November, 1899, and educated in the local schools. His early interest in mechanics led him to seek further knowledge and he attended an automobile school in Kansas City, Mo. In 1916 he obtained work as a mechanic and chauffeur in the Chickasha and Lawton Construction Company, but in the summer of 1917 joined the Students' Army Training Corps at the University of Oklahoma, and there learned the intricacies of radio. At the close of the World War, he obtained work in the oil fields, and eventually became a driller. Always anxious to get into the aeronautical field, he persuaded friends to let him act as a parachute jumper on their air tour of the Southwest. They agreed and for almost two years he went about the country making parachute jumps. Making a successful flight in the plane of a friend, he was determined to buy his own plane and to obtain the money went back to oil drilling in 1924. On his first day at work he suffered an injury to his left eye which necessitated its loss. He was awarded about \$2000 compensation, and out of this money purchased his first aeroplane.

For a few years he toured the Southwest giving exhibitions, until in 1928 he became a pilot for F. C. Hall, an Oklahoma oil man. Hall purchased a Wasp-motored Vega monoplane, which he christened the *Winnie Mae*, in honor of his daughter. In order to qualify as a licensed pilot, Post had to furnish the Government with 700 logged flying hours, which was more than usually required, because of his defective vision. This he did in about eight months. Shortly after, Mr. Hall turned the *Winnie Mae* back to the factory and Post flew it to California, where the Lockheed Aircraft Co., offered him a job as a test pilot. He accepted and served as a flying escort for the Women's Air Derby of the 1929 National Air Races, and also demonstrated the Lockheed plane on the Ford Air Tour.

In 1930, Mr. Hall rehired Post and ordered a new ship, also named the *Winnie Mae*. Post persuaded him to let him use it in the Bendix Trophy Race from Los Angeles to Chicago, and he won first prize of \$7500, flying the Lockheed-cabin plane with a Pratt & Whitney Wasp engine, his time being 9 hours, 9 minutes, and 4 seconds. He now made plans for a round-the-world flight, and financed by Mr. Hall, he engaged Harold S. Gatty to act as a navigator. The pair flew 15,474 miles in 8 days, 15 hours, and 51 minutes. The flight was begun at Roosevelt Field, N. Y., on June 24, and was completed on July 10, 1931. See YEAR BOOK 1931.

Post then purchased the *Winnie Mae* from Mr. Hall and in 1933 made plans for a solo flight-around-the-world, which he started from Floyd Bennett Field, New York on July 15. The length of the flight was 15,596 miles and the elapsed time was 7 days, 18 hours, and 49½ minutes, beating the record he and Gatty made two years previously by 21 hours and 1½ minutes. His record of 25 hours and 45 minutes from New York to Berlin, made during this flight, was considered one of the greatest and most accurate flights ever made. The

flyer utilized to great advantage the automatic pilot, a gyroscopic stabilizer connected to ailerons and rudder, for holding the plane on a true course while he rested. See YEAR BOOK 1933. For this globe-circling flight he was awarded the gold medal of the Fédération Aéronautique Internationale in the following year. In 1934 he flew the *Winnie Mae* to an unofficial altitude of 48,000 feet, but a defective barograph prevented the record from being accepted.

During the latter part of 1934 and the first half of 1935, Post devoted considerable time to showing the feasibility of increasing aeroplane speed by flying in the rarefied air of the sub-stratosphere. He built a flying suit in which he could maintain normal atmospheric pressure and oxygen content about his body regardless of altitude, and had his ship's motor equipped with a supercharger to maintain its power in the thin upper air. He made four attempts to cross the North American continent by stratosphere flying but failed. His first attempt was made Feb. 22, 1935, and ended, due to mechanical trouble, in the Mohave desert; the second, begun March 15, ended at Cleveland, his plane running short of oil; the third ended at Lafayette, Ind., on April 14, and the fourth, at Wichita on June 15, the last two being due to mechanical defects.

After his unsuccessful stratosphere flights, he decided that the *Winnie Mae* had outgrown its usefulness, and so purchased a new plane, supervising the building of it himself. It was a red Lockheed monoplane of low wing type, with an Orion fuselage mounted on a Sirius wing, and equipped with pontoons for sea landings instead of wheels. Deciding to take a vacation and revisit Siberia, he, accompanied by Will Rogers (q.v.), left San Francisco on Aug. 1, 1935, on the way north. They made several short jumps, and on August 15 left Fairbanks for Point Barrow. They were forced down at Walkpi because of motor trouble but continued on their way after Post made a few repairs. Rising about 50 feet, the motor began to miss and Post, in an endeavor to glide back to the river, banked the plane, which dove earthward with terrific force, and its two occupants were killed.

One of the most capable of American flyers, whose achievements helped to place American aviation in the position it enjoys to-day, Post was awarded, besides the gold medal of the F.A.I., the Distinguished Flying Cross by Act of Congress in 1932, the Collier Trophy for the outstanding aeronautical feat of the year, and, in 1934, the gold medal and \$700 prize founded by the late King Albert of Belgium, and the Harmon Trophy of the F.A.I.

POTATOES. The 1935 potato production of 21 countries reporting to the International Institute of Agriculture, all countries of the northern hemisphere and not including the Soviet Republics, was reported as 3,710,265,000 bu. which was 12.9 per cent below their production in 1934 and 6.5 per cent below their average yield for the five years 1929-33. The 1935 acreage of 21,648,000 acres was 1.2 per cent below the acreage of 1934 and 1.3 per cent above the average area for the five-year period. The leading European potato-growing countries not including Czechoslovakia, France, Spain, Italy, and Rumania, reported the following yields in 1935: Germany 1,510,151,000 bu., Poland 1,079,762,000 bu., England and Wales 103,749,000 bu., Bulgaria 101,411,000 bu., and the Netherlands 91,670,000 bu. In 1934 France produced 611,887,000 bu., Czechoslovakia 340,580,000 bu., and Spain 177,152,000 bu. For the five years 1928-32 the

Soviet Republics recorded an average production of 1,602,822,000 bu. and an average acreage of 13,496,000 acres. In the crop-year 1933-34 Argentina produced 33,778,000 bu. The Canadian crop of 1935 was estimated at 64,643,000 bu. produced on 507,000 acres, the crop being 19.4 per cent and the acreage 10.9 per cent below the yield and area of 1934.

The 1935 production of potatoes in the United States as estimated by the Department of Agriculture was placed at 356,406,000 bu., approximately 29,000,000 bu. less than the large crop of 1934. In the northern States freezing weather in the fall of 1935 reduced the yield and impaired quality. The 1935 potato production of the 18 surplus States was estimated at 243,602,000 bu., and compared with 272,274,000 bu. in 1934 and 251,873,000 bu., the average production for the five years 1928-32. The production in the 12 other late potato States, estimated at 39,535,000 bu., was about 360,000 bu. below the 1934 crop. The yield per acre for the entire country was 109 bu. compared with 116.4 bu. in 1934 and an average of 112.8 bu. for the 10 years 1923-32. The average farm price during the earlier part of 1935 marketing season was 58.6 cents per bu. or 11.7 cents above the average farm price of the 1934 marketing season. On the basis of these prices the 1935 crop was valued at \$208,713,000 and the 1934 crop at \$180,761,000.

The yields of the leading producing States in different groups was reported as follows: late surplus States, Maine 38,640,000 bu., Minnesota 28,390,000 bu., Michigan 24,985,000 bu., and Pennsylvania 22,572,000 bu.; late non-surplus States, Ohio 12,826,666 bu., Iowa 6,300,000 bu., Indiana 5,280,000 bu., and Illinois 4,050,000 bu.; intermediate crop States, Virginia 11,352,000 bu., New Jersey 9,750,000 bu., Kentucky 5,763,000 bu., and Missouri 4,212,000 bu.; and early crop States, North Carolina 9,130,000 bu., Tennessee 4,446,000 bu., Arkansas 3,476,000 bu., and Texas 3,240,000 bu.

The 1935 certified seed potato production was estimated at 12,093,000 bu. Maine, the leading State, reported a yield of 5,872,000 bu., and North Dakota, ranking next, a yield of 1,430,000 bu. During the fiscal year ended June 30, 1935, the United States exported 73,067,000 lb. and imported 18,581,000 lb. of potatoes.

POUND, CUTHBERT WINFRED An American jurist, died in Ithaca, N. Y., Feb. 3, 1935. Born in Lockport, N. Y., June 20, 1864, he graduated from Cornell University and studied law with John E. Pound of Lockport, being admitted to the bar in 1886 and entering into partnership with his brother in Lockport until 1895. His first political office was that of city attorney, which he held from 1889 to 1891. Three years later he was elected a member of the New York State Senate and served until 1895 when he was defeated for the renomination. During his term of office he served on many important committees, including those of privileges and elections; state prisons, of which he was chairman, and the judiciary, internal affairs, and general laws. He was a member of the Lexow Committee to investigate the police department of New York City and was on the special committee which examined charges of bribery made by the *New York Press* against certain senators. Also, he served on the committee that investigated the Onondaga Salt Springs Reservation and was the author of the minority report adopted by the Senate. He introduced several bills which became laws, among which may be mentioned, the compulsory education act; amendment to the corrupt practices act

prohibiting bribery at caucuses and conventions; and the act creating a commission of prisons pursuant to the new constitution. He had charge of the woman suffrage constitutional amendment in the Senate, which for the first time passed both houses.

In 1895 he was appointed professor of law at Cornell University, teaching constitutional, corporation, and criminal law, and in 1900 was appointed to the New York Civil Service Commission, two years later being elected its president. In 1904 he resigned from the Cornell faculty and, in the following year, from the Commission to return to private practice. In that year he became counsel to Gov. Frank W. Higgins, and served until 1906, when he was appointed a justice of the Supreme Court for the 8th Judicial District of New York to succeed the Hon. Henry A. Childs. In 1907 he was elected for the full term of 14 years, but in 1915 was appointed associate justice of the New York Court of Appeals, being elected in 1916 for the term ending 1930. He was reelected in November of that year for the term 1931-34, and in 1932, Gov. Franklin D. Roosevelt appointed him chief justice. He retired at the expiration of his term in 1934, having reached the retirement age.

During the period he served on the bench, he was the author of many decisions, of which some of the more important ones were. *Quinby v. Public Service*, which limited the power of the Public Service Commission to raise trolley fares fixed by local franchise; *New York v. Brooklyn City R.R. Co.*, upholding the power of the city to operate street railroads; *P. ex rel Chadbourne v. Voorhis* on the constitutionality of literacy tests for new voters.

In 1921, Judge Pound was the chairman of the convention to revise the judiciary article of the New York State Constitution, and in 1934 was a member of the State Judicial Council formed to regulate and speed up court procedure. He contributed many articles to legal reviews, particularly "Defective Law. Its Cause and Remedy," to the New York State Bar Association *Bulletin*.

POWER PLANTS. An index of returning industrial activity during 1935 was provided by the notable increase in power output of the electric utilities as well as by the considerable new construction among industrial power plants. Not only was the central station output consistently greater throughout the year than that of 1934 by more than 9 per cent, but it also exceeded that of 1929 by over three billion kilowatt-hours. During the fall months the increase was especially marked and an all-time peak was reached in December. The total production of electricity by central stations in 1935 was approximately 93,500,000,000 kw-hr compared with 85,564,000,000 kw-hr in 1934 and 90,277,000,000 kw-hr in 1929. If the output of electric railways, public works, and other plants generating power for public use be added to that of the central stations, the total energy generated during 1935 would be 98,670,000,000 kw-hr. Of this approximately 60 per cent was generated by fuel and 40 per cent by water power. The foregoing figures are, of course, exclusive of electricity generated by private industrial power plants of which there is no combined record.

The growth of central station output (including electric railways and other plants supplying power for public use), the capacity and the improved efficiency of generation, as indicated by the consistent decrease in pounds of coal per kw-hr, are shown in the accompanying tabulation of figures compiled by the U.S. Geological Survey.

Year	Electricity generated (kilowatt-hours)	Capacity (kilowatts)	Coal per kilowatt-hour (pounds)
1919	38,921,000,000	13,093,972	3.2
1921	40,975,000,000	15,448,126	2.7
1923	55,655,000,000	17,458,367	2.4
1925	65,870,000,000	23,648,500	2.1
1927	80,205,000,000	27,052,197	1.84
1929	97,352,000,000	31,952,396	1.69
1931	91,729,000,000	35,590,072	1.55
1933	85,402,000,000	36,038,465	1.47
1934	91,150,000,000	35,873,825	1.47
1935	98,670,000,000	35,803,628	1.47

In April, 1935, the first Interim Report of the National Power Survey was released by the Federal Power Commission. This covered a study of 215 electric utility systems comprising 91 per cent of the installed generating capacity in central stations. The Report contended that a resumption of normal industrial activity, plus the greatly increased domestic use of electricity, would find the utilities short of capacity inasmuch as very little new generating capacity had been installed since 1931 and much of the older equipment was rapidly becoming obsolete. This contention was vigorously disputed by utility executives at the annual meeting of the Edison Electric Institute in June. Adequate capacity was claimed and those responsible for the Power Survey Report (see section on Water Power) were accused of attempting to justify the vast hydro-electric developments undertaken with government funds. The fact that the holding company legislation was then pending and was being vigorously opposed by the utilities was a factor in their deferring new construction.

However, toward the end of the year a number of the utilities were forced to heed the steadily increasing load by planning and initiating proposals for additional capacity and a number of contracts were let. The number of proposals pending at the end of 1935 were indicative of considerable construction activity in the utility field during 1936. In most cases these do not involve new power stations but rather the installation of large high-pressure boilers and turbines, exhausting to low-pressure equipment in existing stations. This arrangement, known as "Super-position," makes it possible to add capacity at minimum unit cost, since it involves no expenditure for site, building, condensers, circulating-water tunnels, etc., and at the same time increases the overall station efficiency.

In such additions boilers ranging from 300,000 to 900,000 lb. of steam per hour predominate and steam pressures of 700, 900, or 1200 lb per square inch are employed. There is also a decided trend toward higher steam temperatures of the order of 875 to 925 degrees F, advances in metallurgy having provided suitable materials for superheaters, piping, valves, and fittings to withstand such temperatures satisfactorily. With few exceptions, these large boiler units are being fired with pulverized coal and the slagging type of furnace is being employed in many cases. For boilers of capacities under 250,000 lb. of steam per hour either stokers or pulverized coal are being used, depending upon the coal available and local conditions or preferences.

The reliability of large modern boilers is now comparable to that of the turbines and this has resulted in the unit plan of one boiler per turbine being adopted in several instances, notably the new Port Washington Station of the Milwaukee Electric Railway, Power & Light Company which went into service during the Fall of 1935. This plant has a single boiler capable of supplying 690,-

000 lb. of steam per hour at 1200 lb. pressure to an 80,000 kw turbine generator.

During the year an extension to the capacity of Richmond Station in Philadelphia went into operation. This involved the installation of 165,000 kw capacity in space originally occupied by 50,000 kw. It consisted of a 165,000 kw turbine-generator and two 600,000-pounds per hour boilers.

A survey of investment and operating costs in 16 representative steam central stations, ranging in capacity from 15,000 kw to 200,000 kw, was recently made by *Electrical World* and published in the November 23d issue. This showed the total cost of power produced by these stations to range from 4.17 mills to 14.85 mills per kw-hr with an average of 8.2 mills. Fixed charges averaged 4.9 mills and the production charges 3.3 mills. That is, approximately 60 per cent of the cost was made up of fixed charges on the plant and 40 per cent covered fuel, labor, maintenance, and supplies. Of this 40 per cent, fuel accounted for 60 per cent. Hence of the total cost, fuel comprises 24 per cent. These figures do not, of course, include distribution costs, sales expense, taxes, nor administrative overhead. The heat rate of these stations ranged from 11,600 to 22,800 B.t.u. per kw-hr generated, thus covering a wide spread in overall efficiencies.

PRAIRIE PROVINCES. The general name applied to the three Canadian provinces of ALBERTA, MANITOBA, SASKATCHEWAN. See CANADA.

PRATT INSTITUTE. A nonsectarian educational institution in Brooklyn, N. Y., founded in 1887 and composed of four schools: Fine and applied arts, household science and arts, science and technology, and library science. The 1935 autumn enrollment was 4430. There were 188 members on the faculty and 13 special lecturers. The library contained 145,000 volumes. President, Frederic B Pratt, A.M., LL.D.

PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA. This is the largest body of the Presbyterian communion, being represented by churches in every State of the Union and having official mission stations in Alaska, Cuba, Puerto Rico, and 16 other foreign lands. In 1935 its churches in the United States and abroad were organized into 44 synods and 282 presbyteries. Statistics for the year ending Mar. 31, 1935, showed a total communicant membership in full standing of 1,959,923, with adherents numbering approximately 5,000,000. The Sunday school enrollment totaled 1,568,876. The number of churches was 9025 and of ministers, 9901. Contributions during the year amounted to \$35,718,531, of which \$29,245,506 was for current expenses and \$6,473,025 for benevolences. The board of national missions received \$2,215,302; the board of foreign missions, \$2,071,957; and the board of Christian education, \$438,528, all from living givers. The church maintains 53 colleges, 12 theological seminaries, and 2 training schools for lay workers. It publishes three national official periodicals, *Monday Morning, Everyone*, and *Women and Missions*. Three periodicals, *The Presbyterian*, *The Presbyterian Banner*, and *The Presbyterian Tribune*, are privately owned and have unofficial standing.

The 1935 general assembly was held in Cincinnati, Ohio, May 23-29, 1935. The Rev. Joseph Anderson Vance, D.D., LL.D., pastor of the First Presbyterian Church of Detroit, and president of the board of national missions, was elected moderator; the Rev. Albert I. Good, missionary to the Cameroon, West Africa, was appointed vice

moderator. Like other recent general assemblies of the Church, the 1935 assembly issued definite and vigorous utterances on social questions. It reaffirmed former assembly deliverances on the subject, and declared for "adequate unemployment relief," "social insurance against social hazards, illness and old age," "moral force instead of barbaric methods of violence," opposition to child labor, approval of the membership by the United States in the International Labor Organization, opposition to "the growing sentiment in favor of legalized gambling," condemnation of lynching, "reinvigoration of rural communities with spiritual life and social passion," and other social methods and purposes. The assembly authorized its commissioners from the Presbytery of Washington City to present to the German ambassador, in the name of the assembly, a letter regarding recent reports of an antagonistic attitude in Germany to the churches of the Reich, stating that the members of the Presbyterian Church in the U.S.A. "are deeply aroused over the apparent threat to the very substance of the Christian religion." It also sent to the leaders of the Confessional Synod in Germany a message of encouragement. Plans were approved for celebrating in 1938 the sesquicentennial of the general assembly, and in 1937 the centennial of the board of foreign missions.

The Church has its headquarters, including the offices of the general assembly and the general council, in the Witherspoon Building, Philadelphia, Pa., in charge of the Rev. Lewis Seymour Mudge, D.D., LL.D., stated clerk. The board of Christian education and the board of pensions also are housed there, while the board of foreign missions and the board of national missions are located in the Presbyterian Building, 156 Fifth Avenue, New York City.

PRESBYTERIAN CHURCH IN THE UNITED STATES (SOUTH). This division of the Presbyterian denomination covers the territory commonly known as the Southern States. It was composed in 1935 of 17 synods and 88 presbyteries, with 3545 organized churches, 2460 ministers, and 477,467 members. The ruling elders numbered 16,341 and deacons, 18,555. Contributions for current expenses amounted to \$6,626,358, and for benevolences to \$2,459,710. In 1935 the church was supporting 395 missionaries in Africa, Brazil, China, Japan, Korea, and Mexico; these missionaries were assisted by 4338 native workers. In the six countries there were 69,956 church members and 115,743 Sunday school members.

The church maintains 4 theological seminaries, 1 training school for lay workers (white), 2 training schools for colored people, 16 colleges, 10 junior colleges, 10 secondary schools, 10 mountain schools, 2 Mexican mission schools, and 16 orphans' homes and schools. It publishes the *Presbyterian Survey*, which is the medium of communication of all departments with the membership of the church. Privately owned papers of the denomination are the *Christian Observer* and the *Presbyterian of the South*.

The general assembly met in Montreat, N. C., May 30, 1935. The Rev. Henry H. Sweets, D.D., of Louisville, Ky., executive secretary of Christian Education and Ministerial Relief, was elected Moderator. The offices of the general assembly are at 722 Kirby Bldg., Dallas, Tex. The Rev. J. D. Leslie, D.D., who was stated clerk, died June 11, 1935, and the Rev. E. C. Scott, D.D., succeeded him by appointment of the Moderator.

PRESBYTERIAN CHURCH OF NORTH AMERICA, UNITED. A member of the family of Presbyterian churches, of Secession and Covenant origin, formed by the union in Pittsburgh, Pa., in 1858 of the Associate and Associate Reformed Churches.

The general assembly of the church convened in Akron, Ohio, on May 22, 1935. On that date there were reported in the United States 11 synods, 55 presbyteries, 875 congregations, 881 ministers, 5173 ruling elders, and a church membership of 179,338. The total membership, including missionary fields, was 243,593. The Sabbath school enrollment was 175,620, while the young people's societies numbered 1093 with a membership of 27,329. Contributions for the year 1934-35 totaled \$3,455,126, and missionary contributions \$882,246.

Strong action was taken by the Assembly in support of all accredited agencies working for the return of Prohibition. A Special Committee was appointed to work in cooperation with other bodies in a serious effort to introduce to Christ the 20 million boys and girls in America between 4 and 18 years of age who are receiving no Christian training.

The denomination supports 352 men and women in four foreign mission fields and 296 men and women in homeland mission fields. It carries on medical work in 29 foreign hospitals and dispensaries, conducts educational work in 353 schools at home and abroad, and in 1934-35 reached and influenced the lives of more than 32,000 young men and women in its schools and colleges. The colleges in the United States are: Westminster College at New Wilmington, Pa., Muskingum College at New Concord, Ohio, Monmouth College at Monmouth, Ill., Tarkio College at Tarkio, Mo., Sterling College at Sterling, Kans., and Knoxville College at Knoxville, Tenn. Denominational journals are the *United Presbyterian*, for adults, and the *Christian Union Herald*, for young people.

The moderator of the general assembly of 1935 was the Rev. E. C. McCown, D.D., of Pittsburgh, Pa. The Rev. O. H. Milligan, D.D., of Avalon, Pa., was stated clerk. Headquarters of the Board of Administration are at 705 Publication Bldg., Pittsburgh, Pa.

PRIESTLEY MEDAL. See CHEMISTRY.

PRINCE EDWARD ISLAND. A Province of Canada. Area, 2184 sq. miles; population (1935 est.), 89,000 compared with 88,038 (1931 census). During 1934, there were 1943 births, 1033 deaths, and 536 marriages. Chief towns (with 1931 populations): Charlottetown, the capital (12,361), Summerside (3914). In 1933, there were 476 schools with a total of 18,397 students.

Production. The preliminary estimated value of field crops for 1935 was \$7,871,000 (\$9,054,000 in 1934) of which hay and clover (263,000 tons) accounted for \$2,506,000; potatoes (152,250 tons), \$2,132,000; oats (4,777,000 bu.), \$1,720,000. Livestock in 1934: 96,800 cattle, 54,100 sheep, 31,500 swine, and 27,430 horses. The fisheries catch (1934) was valued at \$963,926 of which lobsters represented \$674,186; cod, \$84,445; oysters, \$60,061. Fur production (1933-34) 14,452 pelts valued at \$540,355 of which silver fox (13,088 pelts) accounted for \$532,960. In 1933, from the 263 factories, with 1065 workers, the value of products was \$1,485,516 net.

Government. For the fiscal year ended Dec. 31, 1935, revenue amounted to \$1,914,671; expenditure, \$2,997,399; public debt, \$5,221,746;

sinking funds, \$1,114,033. Government was administered by a lieutenant-governor and a legislative assembly of 30 members elected for four years by popular vote (30 Liberals were elected at the Provincial general election of July 23, 1935). The Province was represented in the Dominion Parliament at Ottawa by 4 Senators and 4 members in the House of Commons (4 Liberals were elected at the Dominion general election of Oct. 14, 1935). Lieut.-Gov., G. D. DeBlois; Premier, T. A. Campbell. See CANADA under *History*.

PRINCETON UNIVERSITY. A nonsectarian institution of higher learning for men at Princeton, N. J., founded in 1746. The total enrollment in the autumn of 1935 was 2569, of whom 2295 were undergraduates and 274 were graduate students and fellows. The faculty numbered 319. The endowment in 1935 was \$26,929,810.18; the total operating income, \$2,825,078.72; and the total operating expenditures, including reserves, \$2,750,498.75. Requests and gifts amounted to \$304,154.58 for endowment, \$143,270.79 for current expenses, \$16,401.10 for student aid, \$100,627.87 for buildings, and \$4650 unallocated. The library in 1935 contained about 720,000 volumes, exclusive of pamphlets, broadsides, and manuscripts. President, Harold Willis Dodds, Ph.D., LL.D., Litt.D.

PROHIBITION. The Federal Alcohol Administration. Among the numerous agencies whose authority was destroyed by the declaration that the NRA was unconstitutional was the Federal Alcohol Control Administration, created by Executive Order 6474 on Dec. 4, 1933. Its powers were derived from the National Industrial Recovery Act. Under the provisions of H. R. 8870 (74th Congress Public 401, approved Aug. 29, 1935), the Federal Alcohol Administration was established as a division in the Treasury Department to replace the defunct organization, and all papers, records, and property of the latter were transferred to the new Administration.

Immediately on the signing of the act the Director of the expiring FACA issued a press release calling the attention of the members of the several alcoholic beverage industries to the fact that some of the provisions of the new law were effective immediately and that violation of them would entail the penalties described. Among these provisions were those prohibiting the establishment of exclusive outlets (known as "tied houses"); commercial bribery; consignment sales; alteration, mutilation, destruction, obliteration, or removal of labels; and interlocking directorates. The laws regulating bulk sales and bottling were also a part of the fundamental law, but the same exemptions were allowed as formerly, e.g. bulk sales to distillers, rectifiers of distilled spirits, wine makers, etc., were permitted. Various other matters, such as labeling, advertising, and the obtaining of basic permits were made points for administrative action.

During the period between the collapse of the authority of the FACA and the establishment of the FAA there was virtually no national regulation of the liquor business of the country. The Administrator of the new organization had, therefore, to start from the beginning and work out new plans. This task was given to Franklin C. Hoyt,

Mr. Hoyt was forced to resign as of Dec. 31, 1935, because of ill health. In his letter of resignation he said that,

Since I have been in office I feel that considerable progress has been made toward that end [working out the preliminary organization of the administration], although our activities, as you know, have been carried on under somewhat difficult circumstances. All of the permits to producers which under the provisions of the law had to be issued by November 23 have been passed upon, public hearings have been held and practically all the general regulations required by the act have been drawn and either adopted or proposed for adoption.

At about the same time as Mr. Hoyt's resignation was announced, it was also made known that in his report to Congress the retiring administrator would advocate that the FAA be made an independent bureau, entirely separate from the Treasury Department. This was interpreted as a move to simplify the activities of the Administration.

In explaining the FAA to the public, Administrator Hoyt summarized the law as follows:

The new act gives the Federal Alcohol Administration jurisdiction over distillers, wine-growers, importers, and wholesalers—the large-scale distributors—by providing a permit system under which a rigid supervision of those who enter the field of producing and distributing liquor can be exercised. These permits can be revoked after proper hearing by the administrator for violation of the law and his regulations.

The main purpose of the new act is to protect the public and the consumer from inferior and harmful products manufactured and marketed by unscrupulous liquor dealers. While it may not result in limiting the consumption of liquor, it will at least help to safeguard the consumer in respect to the quality of the goods he may buy and in large measure will prevent the entry of criminal disreputable and undesirable characters into the wholesale liquor trade.

It was also pointed out that fines can be levied for violations of the regulations of the Administration and that while limited personnel at present precludes the possibility of detecting all violations, it is presumed that few violators entirely escape because they are under the surveillance of tax-collectors, fellow dealers, and the general public. In the Administrator's opinion, entirely to control the situation would require that the personnel of the organization be increased from 140, as at present, to about 200. It is also the task of the Administration to prevent the shipping of liquor into bone-dry States, and the shipment of "hard" liquors into States permitting wines and beers only. While the organization has comprehensive powers over bad trade practices, it is not concerned, as was its predecessor, with price fixing.

Liquor Revenues. In early December, Secretary of the Treasury Morgenthau announced that the levies collected on distilled spirits, beer and wine from December, 1933, through October, 1935, amounted to \$772,577,452, and the November receipts were expected to push the figure of the eight hundred million mark. During the same 23 months, customs collections on liquor imports were in excess of \$77,000,000. In an intensive drive to obtain greater collections from the liquor traffic, the Treasury started strict supervision of retail stores in cities of more than 100,000 population, using unemployed "white collar workers" and the inspectors of the Alcohol Tax Unit. This drive was a success. The Department also cooperates with local governments in enforcing all liquor laws.

Distilled spirits withdrawn from bonded warehouses for consumption during the 1934 fiscal year totaled 38,459,023 gallons, and increased to 75,072,993 gallons in the 1935 fiscal year. On Sept. 30, 1935, there were 175,885,829 gallons of whiskeys of various types stored in bonded warehouses, an increase of over 84,000,000 gallons since Dec.

31, 1934. While consumption is on the increase, the Treasury officials calculate that last year's consumption was but 70 per cent of that of 1917, the peak of pre-prohibition years. In announcing the figures, Secretary Morgenthau said that:

The collection of revenue has been heavy. The production of bootleg liquor has decreased. The price of liquor has gone down. The quality has improved. Overseas smuggling is almost nil.

The Bootleg Industry. There is, however, another side to this picture. Aerial rum patrols are maintained on the Canadian and Mexican borders, and Coast Guard cutters are constantly on the alert for rum runners off the sea coasts. Moreover, the manufacture of bootleg liquor still goes on within the country and finds a ready market in the big cities. Counterfeit labels and revenue stamps are turned out by the thousands. What proportion of the liquor actually consumed in the United States (not reflected in the figures cited above) is bootleg is impossible to say, but some figures issued by the office of the Commissioner of Alcoholic Beverage Control of New Jersey give an insight into the extent of the illicit traffic.

During the first 10 months of 1935, the operatives of this office seized 389 stills with a capacity of 161,385 gallons; 10 cleaning plants in which denatured alcohol is "washed" with ether, chloroform and caustic soda; 7 rectifying plants; 58,549 gallons of alcohol which the bootlegger would expand into approximately 234,000 gallons of vendible liquor; 15,383 gallons of wine and 1,643,176 gallons of alcohol mash. These figures, of course, merely indicate the quantity discovered and seized in one State of the union. Joseph Choate, Jr., Administrator of the defunct FACA, estimated that 50,000,000 gallons were consumed untaxed in the first year of repeal. There are indications that the situation has materially changed during the second year. But it is known, on the other hand, that liquor smuggling has experienced something of a revival.

Under the dateline of Nov. 20, 1935, the *New York Times* carried a story in which it was asserted that Antwerp, Belgium, was rapidly becoming the headquarters of the international bootleggers catering to the American trade. Using Antwerp as a base, liquor is ostensibly shipped to Newfoundland, and then transferred at sea to rum-runners who land it in the United States. As an example, the story cited the case of a Norwegian tramp steamer which was loaded at Antwerp with 21,000 cases of pure alcohol consigned to St. John's, Newfoundland. This represented 500,000 quart bottles of whisky when cut, labeled, and treated. The steamer was under charter by a Halifax, Nova Scotia, company identified with rum-running and the cargo was transferred at sea to rum-runners. The steamer was fined \$500 on arrival at St. John's for violating the technical rule governing "breaking bulk," an offense against international shipping rules.

Not only is the continued distribution of bootleg liquor a menace to health, but it is also a disastrous competitive factor in the legitimate liquor trade. A competent authority presents the figures as follows:

As it stands, the Federal tax is a protective tariff for the bootlegger. Alcohol costs the legitimate dealer only 20 cents a gallon to produce because he produces in great bulk. But it bears a Federal tax of \$2 and a State tax of \$1 per gallon—a tax of 1500 per cent. Add to this the expense of distribution and the reasonable profits of the distiller, the wholesaler and the retailer, about \$1.27, and the minimum price at which legitimate alcohol may reach the consumer is \$4.47. The bootlegger sells it for \$2.50 a gallon.

Fair competition is out of the question. As long as these high taxes remain the differential between legitimate and illicit industry is a standing invitation to violate the law.

A second aspect of the situation is the constancy of the number of prisoners committed to Federal jails for violations of the liquor laws. Mr. Sanford Bates, director of the Bureau of Prisons, reported on this latter for 1935 as follows:

The relief which we expected to come from the repeal of prohibition has not materialized. During the year 1932, when the enforcement of the liquor laws under the Department of Justice was at its height, nearly 50 per cent of those committed to Federal institutions were sent there for liquor law violations. For 1935 the proportion is nearly as large as it was during the prohibition days.

The Repeal Debate. It is but natural that the argument over the meaning of the repeal of prohibition should continue unabated and that contradictory statements should be made from time to time. A typical pro-repeal statement was that issued by J. M. Doran, Administrator of the Distilled Spirits Institute, Inc., on the occasion of the second anniversary of repeal. He listed as benefits:

- 1 Increased receipts to the Federal Treasury and to State governments where sales are legal.
2. A corresponding reduction in the operations of bootleggers who, during the first year of repeal, were said to have sold 50 per cent of the liquor consumed by the public.
- 3 Fourteen additional States by statute turned from a situation of no control of the liquor traffic to legalization of sales and strict enforcement.
4. The Federal Congress met the desire of our industry by adopting a vigorous statute to take the place of control imposed by the code system.
- 5 Greater stabilization of the industry in plant operation and marketing methods which have resulted in improved quality of the product and a corresponding reduction in the price level.
6. Fragmentary statistics quoted from time to time relative to increased accidents are somewhat surprising inasmuch as in many instances greater percentage increases are shown, both with respect to accidents and deaths from alcoholism, in dry States than in the more populous States where control is exercised over the beverage liquor traffic. In attempting to draw conclusions from fragmentary accident statistics, apparently no account is taken of the increased population, the increased number of cars and trucks in operation and the much greater speed of the motors as compared with three years ago. The accident curve appears to reach its top on Sundays, and it is difficult to attribute this top figure to drunken driving.

This may be taken as a "brief" for one side. Equally indicative of conditions, and far more impartial, are figures issued by the Census Bureau on the number of deaths from alcoholism. The study extends over a number of years and from it it is possible to discover that the high point of such deaths occurred in 1913 when the rate was 5.9 per 100,000 population, followed by a slump, and a rise to 5.8 in 1916. The figure once more declined and during prohibition never reached a point higher than 4 deaths per 100,000 population. The figure for 1933, the last year yet available, was 2.6. There is considerable variation among the several States. Nevada, for example, reached the highest rate on record in 1929 with 26.6. As between 1933 and 1934, the States showing the largest individual increases (national average not available) were technically dry States, Georgia, North Carolina, Oklahoma, and Texas. On the other hand, in a wet State like New York, the year 1934 marked an abrupt decline in the number of deaths from alcoholism.

Closely related to these figures, although not concerned with death, is the statement of the Secretary of the Keely Institute, a "drink cure" establishment, to the effect that there was a 14 per cent increase in the number of women patients during the first 10 months of 1935. Of these 77 per cent were housewives and the 23 per cent remain-

ing school teachers, nurses, bookkeepers, saleswomen, office workers, and restaurant keepers. This would seem to indicate that the home is a very unsafe place. In this connection it is interesting to observe that the Alcohol Commissioner of New Jersey released a statement early in December condemning the advertising for sale of small liquor flasks that "fit the purse."

Under the stimulation of these very contradictory facts and figures the "drys" are once more about to launch a campaign for a prohibition amendment under the leadership of the Women's Christian Temperance Union and the Methodist Board of Prohibition and Public Morals. Although relying to some extent on carrying on the fight under the local option laws, chief attention will be concentrated on Congress. It is hoped to make a beginning by drying up the national capital and the sympathetic cooperation of Representative Guyer and Senator Capper, both from Kansas, has been enlisted. The nation-wide campaign has been assigned to the National Temperance and Prohibition Council which embraces all the dry organizations. It is calculated that the nation is divisible into thirds: Dry, wet, and neutral. Late in December the Anti-Saloon League let it be known that it, too, would soon be active in the campaign again. Dr. F. Scott McBride, Superintendent, issued the following list of points to be stressed by the workers:

No promise of the wets to regulate liquor has been kept. Drinking and drunkenness have increased decidedly everywhere, returning the "staggering drunk" to the streets. Automobile and other accidents caused by alcohol "have made repeal the bloodiest period in our peacetime history." The bootlegger has remained, furnishing more than half the hard liquor consumed since repeal.

The cocktail hour and other drinking schemes have proved "a greater menace to women and girls than the old-time saloon ever did to men and boys."

One distillery has advertised a "mild" whisky for women, saying as many women as men would be drinking whisky in 25 years, thereby breaking a wet "promise" to sell liquor only to those who would drink anyway.

Revenues from liquor are "less than the relief money squandered for liquor," but "repeal is impoverishing both labor and the farmer," and the public must pay for damage and crime caused by alcohol.

Corruption has increased and "Legislatures have again become submissive to liquor." The saloon has returned—"the better wets are moving toward the saloon as an improvement over present conditions."

Repeal has undermined the veracity of political leaders.

At the same time Mr. McBride stated that over 2000 different local governmental units had voted dry during the past two years; that in his opinion a majority of the States would be dry by their own action in 1940; and that "with an aggressive campaign" 40 States can be dry in 1945. He pointed out that in recent State-wide contests on the issue, the drys won in Mississippi, North Dakota, Kansas, Alabama, and Georgia. At present but seven States are legally dry: Alabama, Kansas, Oklahoma, Georgia, Mississippi, North Dakota, and Tennessee. Florida, Texas, and North Carolina are partly dry. Mr. McBride did not specify which seven States would remain wet even after 1945.

That the hopes of the professional drys are not figments of heated imagination is indicated by a statement of the chairman of the New York State Liquor Authority, Edward P. Mulrooney. According to Mr. Mulrooney, three trends are observable: (a) a growing indifference on the part of the public about safeguarding the fruits of repeal; (b) strenuous efforts on the part of certain liquor interests to circumvent or nullify the liquor regulations; and (c) the increase of dry sentiment. While commenting on the fact that in certain re-

spects there had been an improvement in consumption habits, all was not well. He instanced, however, the fact that whereas in 1932 three and a half truck loads of empty whisky bottles were removed from Yankee Stadium after each football game, in 1935 this had been reduced to half a truck load. Yet it is on the heavy drinking of football crowds that dry critics have based many of their statements. There is also widespread criticism of increasing drunkenness among very young women. Summing up his impressions, Mr. Mulrooney said:

Reports indicate the never-ceasing activity of the dry sentiment, and if the apathy of the general public is to continue, unquestionably the dries will make definite inroads and endeavor to restrict many of the privileges now enjoyed by the people of the State.

In an effort to control the situation, the State Liquor Authority has initiated a temperance campaign, utilizing booklets, colored posters, and official speakers as the occasion offered.

PROTESTANT EPISCOPAL CHURCH.

During the year 1935 the Episcopal Church observed the centennial, and in some instances the sesquicentennial, anniversaries of significant events in the life of the Church. Of foremost importance was the centenary of the great missionary General Convention of 1835. Under the leadership of George Washington Doane, second Bishop of New Jersey, and other churchmen of that time, the Convention of 1835 squarely faced the missionary task of the Church; reorganized the little voluntary missionary society that had been begun in 1821 by declaring that the Church itself is the missionary society and that all baptized persons are members thereof; elected the first domestic Missionary Bishop; appointed the first missionaries to Liberia; and provided for the publication, beginning in January, 1836, of a monthly missionary magazine, *The Spirit of Missions*.

The year 1935 also marked the centenary of the departure of the Church's first missionaries to China, Francis R. Hanson and Henry Lockwood. This anniversary was marked in China by special services in all parishes and missions in the three Dioceses of Shanghai, Anking, and Hankow, of the Chung Hua Sheng Kung Hui (Holy Catholic Church in China), and a great union service of thanksgiving in the Church of Our Saviour, Shanghai. Chinese churchmen in the three dioceses also made a thank offering to the Church in America for the blessings of the Gospel and the nurturing care received during the past century.

The celebration of the 150th anniversary of the first General Convention held at Philadelphia, Sept. 27 to Oct. 7, 1785, brought to America two distinguished guests from England, the Rev. Stacy Waddy, Secretary for the Society for the Propagation of the Gospel in Foreign Parts, and Sir Edward Midwinter, K.B.E. In December, 1935, not only the Church in America but the nation had the privilege of welcoming a third distinguished guest, the Most Rev. William Temple, Archbishop of York.

The Forward Movement inaugurated by the appointment of a commission headed by the Rt. Rev. Henry Wise Hobson, Bishop of Southern Ohio, at the General Convention of 1934, began its work early in 1935.

The House of Bishops at its annual session in Houston, Texas, Nov. 5-7, 1935, faced missionary

problems of first magnitude when called upon to elect Missionary Bishops for North Tokyo and Liberia, and to seek a solution to administrative problems in the Missionary District of Idaho. The House accepted with expressions of genuine regret the resignations of the Rt. Rev. John McKim as Bishop of North Tokyo on account of age, and of the Rt. Rev. Robert E. Campbell as Bishop of Liberia because of impaired health. Bishop McKim's resignation brought to a close 56 years of missionary activity in Japan, of which 42 were spent as Bishop. His service covered the entire life-span of the Nippon Sei Ko Kwai (Holy Catholic Church in Japan) of which he had been for many years Presiding Bishop. The House elected the Rt. Rev. Charles S. Reifsnider, Suffragan Bishop of North Tokyo, a veteran of the Japan Mission and long distinguished in the educational life of the Empire, as Bishop McKim's successor. The Very Rev. Leopold Kroll, Dean of Holy Trinity Cathedral, Port au Prince, Haiti, and formerly a missionary in the Hawaiian Islands, was elected Bishop of Liberia. His consecration on Feb. 20, 1936, will be within a month of the centenary of the inauguration of the Liberia Mission.

The Missionary District of Idaho, vacant since the translation of the Rt. Rev. Middleton S. Barnwell to Georgia, was divided. The northeastern "panhandle" of the State was transferred to the Missionary District of Spokane. It was impossible at this time to add the southern part of Idaho to the Missionary District of Eastern Oregon. The House, therefore, transferred the Rt. Rev. Frederick B. Bartlett, Missionary Bishop of North Dakota and Executive Secretary of the Department of Domestic Missions of the National Council, to Southern Idaho.

The House of Bishops also accepted the resignations of the Rt. Rev. Albion W. Knight as Bishop Coadjutor of New Jersey, the Rt. Rev. Charles E. Woodcock as Bishop of Kentucky, the Rt. Rev. Charles Fiske as Bishop of Central New York, and the Rt. Rev. Wilson R. Stearly as Bishop of Newark.

Other changes in the membership of the House of Bishops during 1935 were occasioned by the deaths of the Rt. Rev. Thomas F. Gailor (q.v.), Bishop of Tennessee and sometime President of the National Council, who was succeeded by his Coadjutor, the Rt. Rev. James M. Maxon; the Rt. Rev. Edward Fawcett, Bishop of Quincy; the Rt. Rev. Walter T. Sumner, Bishop of Oregon; the Rt. Rev. Samuel B. Booth, Bishop of Vermont; and the Rt. Rev. Ralph E. Urban, Suffragan Bishop of New Jersey. Late in 1935 some of these vacancies were filled by elections but no consecrations were scheduled until early 1936.

In 1935 the total number of communicants of the Episcopal Church in 8098 parishes and missions, was 1,389,592, an increase of 26,178 over the preceding year. The clergy numbered 6410; 162 priests were ordained during the year, while the 15 theological seminaries of the Church reported 426 candidates for orders. In the 5000 Church (Sunday) schools, 506,400 pupils were enrolled. Baptisms during the year numbered 63,056 and confirmations 67,096. The government of the Church centres in a General Convention which meets triennially, the next session (the 52d) to be held in Cincinnati, Ohio, in October, 1937. The affairs of the Church between sessions are conducted by a National Council composed of 28 members.

During 1935 the National Council was forced to carry on its world-wide work on a curtailed emergency budget of \$2,313,000. Work in Dornakal, India, inaugurated in 1933, was strengthened late in 1935 by the sending out of an agricultural missionary. American missionaries abroad numbered 407; native staff abroad, 1508. During the year 8 new missionaries were appointed.

The headquarters of the National Council, which is the board of directors of the Domestic and Foreign Missionary Society, are in the Church Missions House, 281 Fourth Avenue, New York. The chairman of the board is the Presiding Bishop, the Rt. Rev. James DeWolf Perry, of Rhode Island, and the president is the Bishop of Delaware, the Rt. Rev. Philip Cook.

PROTOZOA. See ZOOLOGY.

PRUSSIA, prűsh'a. A constituent Republic of Germany which by a law of the government of the Reich of Apr. 7, 1933, was placed under the absolute rule of a governor (statthalter) who appoints the cabinet. Area, on June 16, 1933, exclusive of the Saar (574 sq. m.), 114,120 sq. miles. Total population (June 16, 1933), 39,934,011. The budget for the year ended Mar. 31, 1936, was balanced at 2,001,000,000 reichsmarks; for 1934-35, 2,094,403,790 reichsmarks. On Apr. 1, 1934, the public debt amounted to 715,871,434 reichsmarks. Governor, Adolf Hitler; Prime Minister, Hermann Goring. See GERMANY.

PSYCHICAL RESEARCH. The last year was one of re-action, and that for many reasons. The previous year had been one of unusual activity and publication, and there was much, consequently, to be digested and tested. In addition, there was a reaction from a change in personnel in both America and England. In America the death of Dr. Walter Franklin Prince was a serious blow, from which the Boston Society for Psychic Research has not yet fully recovered. They have gone a long way, however, by appointing to succeed Dr. Prince one whose work has attracted much attention lately, Dr. J. B. Rhine, of Duke University. In England, Theodore Besterman resigned from his post as Investigation Officer of the Society for Psychical Research, which is now attempting to carry on its work by means of a Research Committee. It is too soon to judge of the results, but it is earnestly to be hoped that this venerable and valuable Society will maintain its activities unimpaired. The S.P.R., as it is affectionately known, has to give a lead to the rest of the students of the subject, and not content itself with following in well-trodden paths; and at the same time it must not concentrate too much on any one aspect of psychical research.

Another outward change during the year was the windingup of the so-called National Laboratory for Psychical Research, in London, the organization of Mr. Harry Price. It cannot be pretended that this was a serious loss, and it was odd to see this body taken over by a University of London Council for Psychical Investigation, even though this is wholly unofficial and extra-academic, as briefly announced last year. This Council has now existed for a year, during which period it has given no sign of life.

Now let us turn to research reactions. The important experiments of Dr. Rhine in telepathy and clairvoyance have had widespread repercussions. Several investigators have repeated his experiments and have tried to obtain his results, but so far without success of any significance. The S.P.R. has published reports on several of these efforts. Hence Dr. Rhine's observations remain as inex-

pliable as ever, and are still quite unique. Efforts must be redoubled to localize the precise cause that enabled him to obtain such an enormously high and so greatly diffused percentage of paranormal perception in his subjects.

Mr. Whately Carington has continued the researches described last year. In a further report in the *Proceedings* of the S.P.R. he studied the control experiments of Theodore Besterman and Oliver Gatty, and frankly acknowledged that his original view "was quite evidently wrong." This result, however disappointing to those who thought that the scientific proof of survival had been approached, if not attained, is nevertheless to be welcomed. It shows that psychical research is growing up, that we are willing to admit our mistakes, and thus much more seriously than before aspiring to the status of true scientific work. At the same time, Mr. Carington believes that there is still valid material in his researches and is continuing his work.

One of the most interesting researches of the year was one by Mr. E. S. Thomas, an Oxford anthropologist. He studied the evidence for the fire-walk, according to which it is claimed of a number of peoples that they are able, in certain cases and in certain circumstances, to walk barefoot, without injury, over live, red-hot wood, charcoal, etc. Mr. Thomas did not content himself with studying the evidence, he tried to repeat it in his own person. He accordingly filled a trench with embers and walked across them, first in his shoes, and then in socks, without experiencing appreciable discomfort. However, the conditions were not altogether comparable.

The Earl of Balfour published a very lengthy study, in the *Proceedings* of the S.P.R., of the psychological aspects of the mediumship of Mrs. Willett. His argument is elaborate and likely to be of interest only to very advanced students of psychical research in its most recondite aspects.

Other publications of the year include, in rough chronological order: Malcolm Grant, *A New Argument for God and Survival*; Mrs. W. H. Salter, *Evidence for Telepathy*; J. Arthur Hill, *Experiences with Mediums*; Joseph J. Williams, *Psychic Phenomena of Jamaica*; Boston Society for Psychic Research, *Walter Franklin Prince. A Tribute to His Memory*; Frau von Moser, *Okkultismus. Tauschungen und Tatsachen*; Gertrude Ogden Tubby, *Psychics and Mediums*.

PSYCHOANALYSIS. See PSYCHOLOGY.

PSYCHOLOGY. An outstanding trend of the past year has been the convergence of psychological approaches, both near and remote, upon social problems. Coupled with this interest in applications there has been a consolidation of the more strictly theoretical lines of thought. The flood of psychological literature is certainly undiminished, and memberships in professional organizations continue to mount at a spectacular rate. It is also evident that the objective and experimental nature of psychological investigations is now taken for granted; significant pronouncements of psychologists are expected to have the laboratory behind them. Summing up these trends one may conclude that psychology as an academic discipline has gained during the past year in prestige and in self-assurance.

Child Psychology. Basic studies of child development, especially of the early years, continue to appear in large numbers. In the United States, where child psychology is a relatively recent interest, attempts to establish developmental norms

were particularly in evidence. E. Dewey published a survey of literature since 1920 on *Behavior Development in Infants* (New York: Columbia University Press) which discloses the special interest of investigators in prenatal development. *Observation of Young Children*, by L. C. Wagoner (New York: McGraw-Hill), contains nearly a hundred schedules for suggested laboratory observations. The experimental work of M. B. McGraw and others in infant behavior, which received much publicity while in progress, appeared under the title *Growth: A Study of Johnny and Jimmy* (New York: Appleton-Century). This investigation of selected twins, which also involved 68 other children, covered two years of life, and in many ways confirmed previous findings in regard to maturation. J. A. F. Roberts furnished a summary of present knowledge about twins ("Twins," *Eugenic Review*, Vol. 27, pp. 25-32). "Twin Investigations in the U.S.S.R.," by S. G. Levit (*Character & Personality*, Vol. 3, pp. 188-193), gives an account of the extensive Russian research, which has been especially vigorous. Another book emphasizing norms and covering most of the preschool period was I. N. Kugelmass' *Growing Superior Children* (New York: Appleton-Century). *Guiding Your Child through the Formative Years*, by W. deKok (New York: Emerson Books), is similar in scope. G. Adams' *Your Child Is Normal* (New York: Covici-Friede) is designed to counteract the stress lately laid upon maladjustment and conflicts in child development. A like point of view characterizes the treatment of the later years of childhood by E. S. Conklin in *Principles of Adolescent Psychology* (New York: Holt). In England, R. Griffiths contributed *A Study of Imagination in Early Childhood* (London: Kegan Paul), outlining the function of imagination in mental development, and making use of drawings by children, the Rorschach procedure, and similar material. *Glands and Efficient Behavior*, by F. Mateer (New York: Appleton-Century), is a non-technical consideration of glandular therapy in relation to children's behavior problems.

Cultural and Social Psychology. Of importance to social psychologists was the *Encyclopaedia of the Social Sciences*, edited by E. R. A. Seligman and A. Johnson (New York: Macmillan), now complete with the publication of Vols. 13-15 and the index. Another extensive undertaking was the English translation of V. Pareto's treatise on general sociology, *The Mind and Society* (four volumes; New York: Harcourt, Brace). This work, many years in preparation, emphasizes somewhat in the manner of Rignano, but far more diffusely, the irrationality of human thought and conduct. The numerous implicit psychological assumptions on which it is based were examined and criticized by W. McDougall ("Pareto as a Psychologist," *Journal of Social Philosophy*, Vol. 1, pp. 36-52), who pointed out the unhappy results of Pareto's lack of acquaintance with modern psychology.

Social problems are being brought more definitely into psychological focus. Continuing its interest in culture and personality, the Social Science Research Council appointed a committee to survey the frontiers of knowledge in respect to competitive and cooperative practices in the affairs of man. One objective of this investigation is to disentangle, so far as possible, "biological causation" from "cultural causation," a much disputed issue at the present time. Another basic problem, of peculiar interest in connection with nationalistic polit-

ical movements, was dealt with by O. Klineberg in *Race Differences* (New York: Harper). This book comprises a comprehensive investigation of racial characteristics and differences, as established by the several biological sciences. The author concludes from his searching examination that cultural influences are of major importance in accounting for racial variations. This point is also admitted by some European investigators, but deductions of "Aryan" superiority are also often made by those working under the surveillance of political interests, as is illustrated by L. J. Bykowski's "Untersuchung des intellektuellen Niveaus der arischen und Jüdischen Schüler in den polnischen Gymnasien" (*Zeitschrift für pädagogische Psychologie*, Vol. 36, pp. 38-40).

An outstanding contribution to the timely topic of influencing thought and behavior was made by L. Doob (*Propaganda*; New York: Holt), who gives a strictly psychological analysis of the factors involved, and an explanation of the successful techniques of propaganda. H. Cantril and G. W. Allport investigated an instrument important not only in propaganda but also in the diffusion of thought in a comprehensive volume entitled *The Psychology of Radio* (New York: Harper). H. L. Hollingworth contributed to the same sphere of interest *The Psychology of the Audience* (New York: American Book). The recent concern of psychologists with the moving pictures continued. Statistics on attendance at moving pictures and the content of scenarios were compiled by E. Dale (*The Content of Moving Pictures*; New York: Macmillan).

The literature of sexual study was enriched by the *Encyclopedia Sexualis*, edited by V. Robinson (London: Dingwall-Rock), as well as by an American handbook called *Encyclopedia of Sexual Knowledge*, edited by A. Costler (New York: Coward-McCann); an English translation appeared of P. Mantegazza's *The Sexual Relations of Mankind* (New York: Eugenic Publishing Company). Another book in this field was M. E. Harding's *Woman's Mysteries, Ancient and Modern* (New York: Longmans, Green) which, following the lead of Jung in employing the background of cultural history, sets forth in detail pertinent myths and legends. M. Mead continued her contributions with *Sex and Temperament in Three Primitive Societies* (New York: Morrow), which concerns three tribes of New Guinea. L. Levy-Bruhl's *Primitives and the Supernatural* was made available in an English translation (New York: Dutton). J. Jastrow's investigation of superstitions (*Wish and Wisdom: Chapters in Erratic Psychology*; New York: Appleton Century) is based upon the eccentric beliefs of civilized people.

An inclusive work on the psychology of industrial problems is *Psychologie van het Bedrijfsleven Problemen en Resultaten der Psychotechniek* by G. Révész (Haarlem: Bohn). H. Baker made a survey of the social-psychological problems of 50 department stores (*Personnel Programs in Department Stores*; Princeton, N. J.: Industrial Relations Section, Princeton University). Miscellaneous contributions to cultural psychology range from G. Wallas' *Social Judgment* (New York: Harcourt, Brace), an empirical and historical account of the judgment process, to *The Psychobiology of Language* by G. K. Zipf (Boston: Houghton Mifflin), which sets forth laws pertaining to the frequency of use of words and other verbal elements. In *Modern Mystics* (New York: Dutton), F. Younghusband emphasizes the ubiquity

of certain mystical experiences. Work in æsthetics included a general discussion, *Concerning Beauty*, by F. J. Mather (Princeton University Press), while G. T. Buswell's study, *How People Look at Pictures* (University of Chicago Press), deals largely with perceptual processes. A comprehensive application of psychological research to æsthetics was published by A. W. Melton (*Problems of Installation in Museums of Art*, American Association of Museums, N.S., No. 14, Washington, D. C.). D. H. Yates made a useful investigation of the activities of commercialized pseudo-psychologists (*Psychological Racketeers*; Boston: Humphries), and this subject was treated also by G. A. Farner ("Praktische Psychologie," *Zentralblatt für Psychotherapie*, Vol. 8, pp. 132-138).

Educational Psychology. Notable in the field of educational psychology was E. L. Thorndike's continued work in adult learning, which he summed up in *Adult Interests* (New York: Macmillan). This book presents detailed measures of performance of people 45 years old or older as compared with the accomplishments of younger individuals. New textbooks in the field include *Educational Psychology* by A. C. Eurich and H. A. Carroll (Boston: Heath); *An Introduction to Educational Psychology* by C. D. Griffith (New York: Farrar & Rinehart); *Psychology of Learning* by R. A. Davis (New York: McGraw-Hill); and *The Psychology of Learning* by E. R. Guthrie (New York: Harper).

The social problems of youth are receiving much attention. N. Miller treats the vocational, economic, environmental, and familial problems of girls in rural districts in the south in *The Girl in the Rural Family* (Chapel Hill, N. C.: University of North Carolina Press), and two studies on *Interests, Activities and Problems of Rural Young Folk*, dealing with girls and with boys, by M. B. Thurrow and W. A. Anderson, were issued by the Cornell University Agricultural Experiment Station.

General and Theoretical Psychology. The "totality" conception has continued to dominate psychological thought. The original nucleus underlying this "totality" conception, Gestalt Psychology, has developed steadily, and its progress was attested by two notable contributions: *Principles of Gestalt Psychology* by K. Koffka (New York: Harcourt, Brace) and *Gestalt Psychology* by G. W. Hartmann (New York: Ronald Press). The former book is especially important for its extension of the principles of Gestalt to topics not hitherto treated by the school, e.g., action, self-consciousness, and social groups. Hartmann reviews the whole movement and also forecasts the treating of psychiatric and educational problems from this point of view. Another "totality" approach which aroused much interest was set forth in *A Dynamic Theory of Personality* by K. Lewin (New York: McGraw-Hill), which comprises a number of experimental papers based on Lewin's "topological" method. This method is also employed by J. F. Brown in approaching in a novel way the problems of social psychology ("Towards a Theory of Social Dynamics," *J. Soc. Psychol.*, Vol. 6, pp. 182-213).

Still another aspect of "totality" psychology, that of personalistics, received thorough treatment by W. Stern in his *Allgemeine Psychologie auf personalistischer Grundlage* (The Hague: Nijhoff). The point of view of this systematic general psychology focuses attention not only upon the unitary nature of mental structures, but upon their personal nature as well. E. L. Thorndike's *The Psychology*

of Wants, Interests and Attitudes (New York: Appleton-Century) expresses a widespread interest on the part of American psychologists in dynamic factors.

The effect of bringing the "uncertainty principle" of physics into psychology was to initiate a new line of attack in theoretical problems, which has acquired the name of "operationism." According to this point of view, the concepts employed by any science need constant purging through a reference to the concrete operations from which each concept is derived. "It is clear that the examination of psychology's conceptual heritage under the searchlight of operationism needs to be undertaken seriously if we are to be rid of the hazy ambiguities which result in ceaseless argument and dissension" (S. S. Stevens, "The Operational Definition of Psychological Concepts," *Psychol. Rev.*, Vol. 42, pp. 517-527). An article by S. Hecht calls attention to the logic underlying this new movement ("The Uncertainty Principle and Behavior," *Harper's Magazine*, No. 1016, pp. 237-249). A further account, for psychology, was furnished by D. McGregor ("Scientific Measurement and Psychology," *Psychological Review*, Vol. 42, pp. 246-266), while a similar application was set forth in Germany by K. Popper (*Logik der Forschung*; Vienna: Springer). The resemblance of this trend of thought to the logical positivism of Carnap should not be overlooked.

Legal Psychology. One field which has long been recognized in Europe, especially in Germany, as a standard domain of psychology, is that of legal processes. This field, which has hitherto been limited in the United States to crime and criminality, was considerably extended during the past year. E. S. Robinson's *Law and the Lawyers* (New York: Macmillan) provided a comprehensive and critical survey of the psychological assumptions and implications of law and of legal procedure. In detailing the many shortcomings of jurisprudence this author urges that fictional or mythological assumptions concerning man and human institutions be replaced by facts. In *Law and the Social Sciences* (New York: Harcourt, Brace), H. Cairns also deals with these assumptions, but points out that the lack of unity in psychology is a hampering factor; *Law and the Social Order* by M. R. Cohen (New York: Harcourt, Brace) further prepares the groundwork for the legal psychology of the future.

Personality and Psychometrics. Factor analysis continues to loom large as a programme for investigating personality and human capacity. C. E. Spearman of London, originator of the factoring method, delivered a special lecture at the annual meeting of the American Psychological Association, presenting an account of new tests using the two-factor procedure. L. L. Thurstone published an inclusive account of his own method of factoring (*The Vectors of Mind*; University of Chicago Press). In *Essential Traits of Man* (Harvard University Press), T. L. Kelley presents still other methods. In general the effort at present is to evolve techniques that are simple enough to be practicable, and unambiguous in their results. Critics of the movement generally attack the obtained factors as meaningless, artificial products, not squaring with the "realities" of mental structure. In contrast to the factoring method, theories of personality based on different conceptions of traits are also being carried forward. There is, for example, the approach through the study of linguistic usage. G. W. Allport and H. S. Odbert have

classified and examined nearly 18,000 designations of traits in English (*Trait-Names: A Psycho-lexical Study*, Psychological Monographs, No. 208), presenting a theory of traits quite different from that advanced by factor-analysis.

A general study of individual differences was produced by D. Wechsler (*The Range of Human Capacities*; Baltimore: Williams & Wilkins). A somewhat similar but more restricted work, based on abilities of business executives, was *Psychometrics* by J. O'Connor (Harvard University Press). Testing of some sort is foundational to most American studies of personality and mental capacity. Although some psychologists cast doubt upon their efficacy, F. Kuhlman ascertained from a questionnaire sent to teachers and institutional staffs that more than half those addressed consider tests "essential and necessary for their work."

Psychopathology. In view of the growing popular belief that conditions of modern living cause an ever-increasing amount of maladjustment and insanity, Dr. Carney Landis of the New York Psychiatric Institute compared institutional figures on insanity for the past generation with population increase, extended life span, and rural and urban distribution of population. He concluded that there has been no appreciable increase in the incidence of mental disease due directly to the economic depression. Arteriosclerosis, a direct result of the prolongation of life, is chiefly responsible for the slight increase in insanity in recent years. A radical revision of current conceptions in psychiatry was proposed by G. Y. Rusk ("Gestalt Psychiatry," *J. of Abnorm. and Soc. Psychol.*, Vol. 29, pp. 376-384), C. M. Campbell in his book entitled *Destiny and Disease in Mental Disorders* (New York: Norton) deals especially with schizophrenia.

A clinical and psychological investigation of *Aphasia* was made by T. Weisenburg and K. E. McBride (New York: The Commonwealth Fund). The editors of *Fortune* contributed a popular survey of psychoneurotic conditions (*The Nervous Breakdown*; Garden City: Doubleday, Doran). A similar German treatment was presented by W. Niederland in *Nervosität! Jedermanns Krankheit* (Berlin-Lichterfelde: Falken-Verl.). Much interest was shown by the public in the "lie detector" because of its possible use in criminology; at the meeting of the American Psychological Association its chief sponsor, V. W. Lyon, declared in favor of the term "emotion detector" as a more appropriate designation for this composite measuring device. The work of H. Davis and F. A. Gibbs on cerebral action currents proved of special interest to psychopathology because of the definitive records obtained in epileptic conditions.

Historical notes on the development of the mental hygiene movement were brought together by W. L. Cross in a book called *Twenty-Five Years After*, the chronological reference being to the early activities of C. W. Beers, whose pioneer work, *A Mind that Found Itself*, was reissued in an anniversary edition by the National Committee for Mental Hygiene. A textbook on mental hygiene is *Mental Health*, by F. E. Howard and F. L. Patry (New York: Harper); another by E. W. Wallin is entitled *Personality Maladjustments and Mental Hygiene* (New York: McGraw-Hill). L. Kanner's *Child Psychiatry* was announced as "the first textbook of child psychiatry in the English language" (Springfield, Ill.: Thomas). One important trend is the increasing favor of psychiatry and mental hygiene among religious workers; some training in clinical psychiatry is now a part of the

curriculum in many of the theological seminaries.

Psychoanalysis is now beginning to close the gaps that hitherto have separated it from other psychological schools of thought. An instance of this tendency is L. S. Kubie's article "Über die Beziehung zwischen dem bedingten Reflex und der psychoanalytischen Technik" (*Imago*, Vol. 21, pp. 44-49), and also P. Schilder's "Psychoanalyse und bedingte Reflexe" (*ibid.*, pp. 50-66). These papers indicate the community of interest between psychoanalysis and Russian "reflexology." Among other psychoanalytical publications was a revised edition of Freud's *A General Introduction to Psychoanalysis* (New York: Liveright).

Psychoanalysis of children is a rapidly growing technique. A. Freud's *Psychoanalysis for Teachers and Parents* gives an account of the author's research in the application of psychoanalytic methods to children and their problems (New York: Emerson Books). In a work entitled *Roots of Crime*, F. Alexander and W. D. Healy (New York: Knopf) discuss eleven selected cases of juvenile delinquents who were psychoanalyzed, and consider the limitations and value of psychoanalysis in dealing with incipient criminality. A somewhat similar much-heralded study is *Wayward Youth* by A. Aichhorn (New York: Viking), whose identification of crime with neurosis has had wide influence in the western world. The book is a good illustration of the type of effect that psychological science is having in modern civilized life.

Special Fields. An undertaking of large proportions in animal psychology was initiated with the publication of the first of three volumes on *Comparative Psychology* by C. J. Warden, T. N. Jenkins, and L. H. Warner (New York: Ronald Press), dealing with "principles and methods." The other volumes will be devoted to plants, invertebrates, and vertebrates. As before, experiments in animal psychology comprised the largest class of papers read before the American Psychological Association.

Much psychological research is being carried on in the Soviet Union, and the ordinary difficulty of the language barrier is overcome in part by three summaries of such work, by R. A. McFarland ("Psychological Research in Soviet Russia," *Sci. Mo.*, Vol. 40, pp. 177-181); G. H. S. Razran ("Psychology in the U.S.S.R.," *J. of Phil.*, Vol. 32, pp. 19-24); R. S. Schultz and R. A. McFarland ("Industrial Psychology in the Soviet Union," *J. Appl. Psychol.*, Vol. 19, pp. 265-308).

Several new inventions and measuring devices in the auditory field are of direct or indirect interest to psychologists. In the Soviet Union much activity was devoted to experiments with "synthetic music" produced by drawing "artificial" sound tracks on moving picture films. N. Volnov of Moscow and E. Sholpo of Leningrad were prominent in this field. Theoretically its extension makes possible the production of any desired tone or tonal combination regardless of the existence of appropriate sound-generating instruments. E. W. Scripture described the use of the reverse procedure in an article on analyzing speech ("Film Tracks of English Vowels," *Journal of the Acoustical Society of America*, Vol. 6, pp. 169-172).

News and Notes. The new quarterly *Journal of Social Philosophy*, open to psychological articles having social significance, was commenced in October with Robert M. MacIver as editor, and published at the College of the City of New York. Alfred Adler is editor of the *International Journal*

of *Individual Psychology* (Chicago: International Publications), also a quarterly, which began in April. To relieve pressure upon American psychological periodicals, and to insure prompt publication, the *Journal of Psychology* was founded at Worcester, Mass., C. C. Murchison, editor. New foreign journals are the *Scandinavian Theoria*; *Tidskrift för Filosofi och Psykologi*, published in Sweden and edited by A. Petzell and others; *Die Schrift*, a journal of graphology published bimonthly (Brunn: R. M. Rohrer) and edited by O. Fanta and W. Schönfeld; *Zeitschrift für politische Psychologie und Sexualökonomie* (Copenhagen: Verlag für Sexualpolitik), edited by E. Parell; *Revista de medicina legal y jurisprudencia médica* (Rosaria, Argentina: Talleres Fenner), R. Bosch, editor. *Contributions to Psychological Theory*, edited by D. K. Adams and H. Lundholm, issued its opening number from Duke University Press.

Professor Joseph Peterson of the George Peabody College for Teachers, Nashville, Tenn., a former president of the American Psychological Association, died in September at the age of 57. Dr. Robert Saudek died in London on April 15 at the age of 54. In 1931 he founded *Character and Personality*, of which he was editor up to the time of his death.

Professor Wolfgang Kohler resigned from the faculty of the University of Berlin, where he became professor emeritus, receiving an appointment as visiting professor at Swarthmore College. Professor Karl S. Lashley, formerly of the University of Chicago, became Professor of Psychology at Harvard. Professor Mark A. May was made Director of the Institute of Human Relations at Yale, and Professor W. S. Hunter of Clark was elected to membership in the National Academy of Sciences. Professor Egon Brunswik of Vienna served as visiting lecturer at the University of California. C. E. Spearman became editor of *Character and Personality* following the death of Dr. Saudek.

A new handbook of psychology was published under the editorship of Charles E. Skinner, having the title *Readings in Psychology* (New York: Farrar & Rinehart). Its 26 chapters, written by nearly as many contributors, contains a varied selection of topics of fundamental importance in psychology. *The Evolution of Modern Psychology* by R. Muller-Freienfels and translated by W. Béran Wolfe contains a detailed account of the major problems in psychology as treated by the various schools of mental science since the advent of experimental psychology (Yale Univ. Press).

The spread of instructional and experimental moving picture films dealing with psychological topics deserves mention, a large number of such films being prepared and marketed in the past year. Among the sponsors and originators of these films are E. A. Doll, S. G. Longwell, A. Gesell, W. L. Valentine, A. Ford, H. Musgrave, M. Metfessel. The subjects include records of animal and infant behavior, stimuli for classroom presentation, and illustrations of experimental techniques. Descriptions of new films now appear regularly in *Psychological Abstracts*.

Among the new textbooks are *Psychology, A Factual Textbook* edited by E. G. Boring, H. S. Langfeld, H. P. Weld (New York: John Wiley & Sons). It is based wholly on experimental data and was produced with the aid of 19 collaborators. Another elementary text is *Psychology* by L. B. Hoisington (New York: Macmillan), coordinating numerous approaches and emphasizing every-

day mental activities. Another text is *General Psychology* by A. R. Gilliland, J. J. B. Morgan, and S. N. Stevens, which also stresses practical applications (New York: Heath). Work books have become popular; an example being the *Student's Guide for Beginning the Study of Psychology* by W. L. Valentine, J. H. Taylor, K. H. Baker, and F. N. Stanton (New York: Prentice-Hall). The fourth volume of the *Nouveau traité de psychologie*, edited by G. Dumas, made its appearance (Paris: Alcan). This volume deals with general organizational functions, and is written by H. Piéron, H. Delacroix, P. Janet, C. Blondel, E. Claparède, and other prominent French psychologists.

Organizations. The American Psychological Association held its forty-third annual meeting at the University of Michigan, Ann Arbor, September 4th to 7th. One hundred and twenty-nine papers were presented at 23 sessions, abstracts of all being printed in the *Psychological Bulletin* (Vol. 32, No. 9). The officers elected for 1935-36 are C. L. Hull (Yale), president; H. E. Jones (California) and M. A. May (Yale), directors. The total enrollment of members and associates is now close to fifteen hundred. The establishment of a new local section of the association for Washington, D. C., and Baltimore was authorized. Two current trends are illustrated by the appointment of two committees, one headed by G. B. Watson, to "study problems connected with the teaching of psychology in high schools and junior colleges," the other with A. T. Poffenberger as chairman, to "examine the question of the social utilization of psychologists, particularly those now unemployed." The activities of the numerous sectional branches of the A.P.A. which met during the year were reported in the *Psychological Bulletin* (Vol. 32, No. 8).

At the fifteenth International Physiological Congress, which met at Leningrad in August, 1500 were present, one of the principal addresses being made by Dr. I. P. Pavlov, now 86 years of age, the pioneer in work on the conditioned reflex. Of considerable interest to psychologists was a paper by W. B. Cannon of Harvard on the chemical products of the nervous impulse. This type of work is discussed by J. S. Gray ("An Objective Theory of Emotion," *Psychol. Rev.*, Vol. 42, pp 108-116).

At the sixth Scandinavian Congress of Psychiatry, held in Stockholm, August 22-24, the general theme was the "somatology of schizophrenia." The meeting of the American Psychiatric Association was held at Washington in May. As is customary, psychological papers were included in the programmes of the American Association for the Advancement of Science, which met at Minneapolis in June and at St. Louis in December. In England, the National Institute of Industrial Psychology considered "temperamental factors in industry." A symposium on "convergent trends in psychology" was held in November at the University of Southern California.

PSYCHOPATHOLOGY. See **PSYCHOLOGY.**
PUBLIC AFFAIRS. INSTITUTE OF. An organization inaugurated in 1927 at the University of Virginia for the purpose of advancing an enlightened public opinion on current political, social, and economic questions of a national character, but enlarged in 1932, after the closing of the Institute of Politics at Williamstown, to include international problems as well.

The attendance at the 1935 session, which was

held from June 30 through July 13, consisted of 2693 registered members and visitors, representing 33 states and 8 foreign countries. Membership in the Institute is open to men and women who have taken part in public life and to all those interested in the discussion of public affairs. There were 156 participants in the programme of round table discussion groups and large popular evening meetings. The largest attendance at an evening meeting in 1935 was 6000. Accounts of the proceedings of the 1935 session were carried in 702 newspapers in 513 cities throughout the United States, Canada, Hawaii, Philippine Islands, and Latin America.

The international part of the 1935 programme included round tables on the following subjects: "Reconstruction Problems in the Light of History"; "Latin-America—International, Economic, and Social Developments"; "European Relations—Rebuilding Peace"; "The Church in a Changing World"; "The Significance of American Membership in the International Labor Office"; "Contemporary Educational Issues"; "Conflict and Cooperation Across the Pacific"; and "American-German Relations." The national programme was composed of round tables on "Economic Security"; "Taxation for Prosperity"; "The Constitution and the New Deal"; and "The Place of Religion in Character Education."

The officers of administration in 1934 were: John Lloyd Newcomb, president of the University of Virginia; Charles Gilmore Maphis, director of the Institute; and Marjorie McLachlan, secretary of the Institute. Headquarters are at the University of Virginia, Charlottesville, Virginia.

PUBLIC FINANCE. There was no change during the year 1935 in the anxiety with which the public regarded the question of Treasury finance and the problems of the balanced budget. Previous years, with their huge deficits, had been the subject of some anxiety and of critical comment on the part of publicists, but at no time had there been any serious apprehension. The position taken had rather been that of asserting that, important as the Treasury situation might be, the purposes for which money was being spent were so much more significant that they ought to be given a leading position in public discussion. During the year 1935, the restiveness of the banks which had been asked to absorb the entire deficit of the community and the urgent representations of qualified economic authorities had led President Roosevelt to devote a considerable amount of attention to the study of the budget; while self-confessed administration spokesmen undertook in magazine articles to forecast the probable length of time in which it would be feasible to place public finance upon a balanced footing.

Concretely there was no immediate change in the simple fiscal policy of the government which consisted in floating enough assorted bonds, notes, bills, and other forms of Treasury obligations to provide the money necessary to cover the deficit. The sums asked for during the early portion of the year footed up to the tremendous total of nearly five billions of dollars; while during the early autumn further refunding and requests for new money practically skimmed off a large portion of the community's savings. These funds were spent as the President had previously foreshadowed, in paying the expenses of public works and "projects" of various kinds, designed to furnish employment to needy persons and hence, to prevent the recurrence of suffering. According to an announcement made by the President, at about the end of No-

vember, places had been found for about 3,500,000 men, and in paying their salaries the enormous appropriations of Congress were steadily used.

Authentic reports of enormous waste and fruitless spending upon impossible projects, as well as bad management of outlays were reported from widely scattered sources, and had the effect during the year of disgusting the public more than ever with this way of destroying the wealth of the nation. The administration, however, although mentally somewhat disturbed by the situation, continued to push further with its programme and as a result the close of the fiscal year 1935 (June 30, 1935) resulted in showing an aggregate deficit after all allowances of \$3,082,128,043. The first half of the new fiscal year resulted in a still larger proportionate invasion of the funds of the community, there being reported on the 31st of December, an excess of expenditures amounting to over two billion dollars. The total debt of the United States rose to a figure well above thirty billion dollars by the end of the year.

One factor of the situation which attracted particularly widespread attention was the continued maintenance of great staffs of Federal employees with relatively limited duties who were allowed to persist in office after the Supreme Court had declared their functions unconstitutional. This was conspicuously true of the NRA, which retained in its employ more than 2000 persons up to a comparatively advanced season of the year. Although the improvement of business and the slight reduction of the number of unemployed tended in some measures to distract the attention of the country from what was occurring, it still remained true that a very large number of the population continued well aware of the status of things and had grown more and more critical of financial method.

The year 1935 was further made noteworthy from the fiscal standpoint by the action of Congress in passing early in August a tax revision bill of drastic character. This measure raised the rates on large incomes above one million dollars a year and on large inheritances, to a practically confiscatory level. The action thus taken was not due to any studied plan for improving fiscal conditions, but was apparently the outgrowth of a political duel between the President and the Senator from Louisiana, the latter constantly asking what had been done or was going to be done to check the growth of large fortunes. As a result of the irritations thus engendered, President Roosevelt, early in July, requested that Congress should, within a few days thereafter, adopt his confiscatory income tax measure. The leaders of both houses refusing to act as thus directed, a summer extension of the Congressional session became necessary. According to official administration estimates the new taxes were calculated to produce an additional income of \$300,000,000, but these figures remain wholly unsubstantiated by any reliable data based upon past experience.

At one stage in the discussion, it was proposed by Senate leaders to make the new measure a real income raising bill by pushing the taxable level of income much lower down than had ever previously been attempted. This proposal was objected to by the President and in the final measure, the rates on small and medium incomes were left unchanged, while the level of exemption was not altered and the measure was characterized by its confiscatory features for large incomes and inheritances. At the same time, although nothing

had been said on the subject and no discussion of it took place, an extensive revision of administrative rulings and methods was put forward by the administration and adopted with little or no discussion by Congress. The measure however, was not to take effect until after the close of the calendar year, so that it produced no influence whatever upon actual Federal incomes during the first half of the fiscal year (up to Dec. 31, 1935). For the first half—July 1 to December 31—the improvement in yield which had begun to show itself in former months was still further emphasized. This improvement was in no small measure due to the fact that provisions previously enacted, to take effect at later dates, were now coming into full operation; while far greater stringency of administration and the application of dubious tax decisions on the part of the Treasury, resulted in the extortion of larger sums on the basis of the old duty rates than had ever before been collected.

It is worth noting at this point that during the summer of 1935, in addition to the tax measure already described, Congress further adopted the so-called Social Security Act, in which provision was made for the ultimate imposition of new taxes amounting to 9 per cent of all payrolls in specified occupations. Of this 9 per cent 3 per cent was to be

paid by the recipient of wages, while 6 per cent was to rest upon the employer. Liability for these duties was, however, spread over a series of years, increasing from year to year, and did not begin until Jan. 1, 1936. Still it remained true that the knowledge of this forthcoming enormous exaction, estimated by trustworthy persons to amount practically to a doubling of all existing taxation, had its effect upon the psychology of the public as to the tax question and tended to strengthen in their minds the thought that something must definitely be done to place the country upon a more scientific basis of levy before much further time had elapsed.

Federal Incomes. The total incomes for the fiscal year ending June 30, 1935, had been enlarged partly by the change in the gold dollar and partly by the changes in taxation for the preceding year. Stated without regard to the effect of such changes, ordinary incomes for the Federal Treasury were \$4,030,127,436 against \$3,277,733,940 for the previous year; while ordinary outlays were \$6,538,697,829 against \$6,883,861,532. The general tendency of incomes was to increase throughout the year due to the fact that business was improving and that actual earnings of corporations and to some extent of individuals were tending upward.

RECEIPTS AND EXPENDITURES FOR THE FISCAL YEAR 1935, ON THE BASIS OF DAILY TREASURY STATEMENTS (UNREVISED), AND ESTIMATED RECEIPTS AND EXPENDITURES FOR THE FISCAL YEARS 1936 AND 1937

GENERAL AND SPECIAL ACCOUNTS		1935, actual	1936, estimates	1937, estimates
Receipts				
Internal revenue—				
Income tax		\$1,099,118,637.90	\$1,434,112,000.00	\$1,942,600,000.00
Miscellaneous internal revenue		1,657,191,518.70	1,873,091,000.00	2,103,114,000.00
Processing tax on farm products		521,379,871.22	529,042,000.00	547,300,000.00
Other internal revenue—				
Tax on carriers and their employees			33,000,000.00	101,600,000.00
Bituminous Coal Conservation Act			5,600,000.00	12,300,000.00
Social Security Act				433,200,000.00
Customs		343,353,033.56	353,191,000.00	354,000,000.00
Miscellaneous receipts—				
Proceeds of Government-owned securities—				
Principal—foreign obligations		66,709.53	69,898.00	72,094.00
Interest—foreign obligations		601,114.48	324,871.00	322,365.00
All other		38,105,611.49	79,476,253.00	62,688,694.00
Panama Canal tolls, etc.		24,704,262.38	24,890,500.00	24,905,500.00
Seigniorage		58,035,251.37	20,000,000.00	19,000,000.00
Other miscellaneous		57,911,191.33	57,996,424.00	53,114,997.00
Total		3,800,467,201.96	4,410,793,946.00	5,654,217,650.00
Expenditures

^a Additional expenditures on these accounts for the fiscal year 1935 are included under "Recovery and relief"

^b Detail on basis of checks issued.

^c The Executive order of June 10, 1933, as amended, provides for the transfer of the function of disbursement of all moneys of the United States (except those relating to the Military and Naval Establishments, rivers and harbors, and Panama Canal) to the Division of Disbursement, Treasury Department. The transfer of such functions in Washington, D. C., of the several departments and establishments subject to the Executive order of June 10, 1933, was completed on July 1, 1934. Therefore, effective July 1, 1934, in the interest of economy and efficiency, the disbursements by the Division of Disbursement, Treasury Department, which appear in daily Treasury statements under the caption "Departmental Expenditures" are on the basis of checks issued. The total shown, after making adjustment for outstanding checks of the Division of Disbursement, relating to such "Departmental Expenditures," is on the basis of checks paid as published heretofore.

^d This item represents seigniorage resulting from the issuance of silver certificates equal to the cost of the silver acquired under the Silver Purchase Act of 1934 and the amount returned for the silver received under the President's proclamation dated Aug. 9, 1934.

^e This item represents transfers of balances in checking accounts of certain special agencies of the Government, net transactions in which will hereafter be shown under this caption.

NOTE.—Excess credits and adjustments in italics to be deducted.

The movement was slow in getting under way but during the first half of the fiscal year 1936 (second half of the calendar year 1935) the enlargement was substantial. On Dec. 31, 1935, the indicated total ordinary deficit was \$1,879,651,192. Receipts for the year 1935 (including postal incomes) were \$4,660,922,938, and gross expenditures (including postal costs) were \$7,744,888,927.

Federal Expenditures. The outlays for the year were gradually increased on account of the action of Congress in placing in the hands of the President a fund of \$4,800,000,000 to be laid out upon "relief" or in any way that seemed likely most to advance the public welfare and to keep men employed. Enormous assignments of funds for so-called "works projects" were made in the belief that it would be possible to transfer persons who were "on relief" to those works projects and thus to "kill two birds with one stone"—help the consumer and at the same time bring about as large a circulation of money, upon the erroneous supposition that rapid and large spending would be beneficial to the community. Expenditures themselves, even without such incidental enlargement, had been very greatly swollen by reason of the fact that the bureaucracy had been so greatly extended and that governmental salaries had been so largely increased in various directions. Although from time to time it was stated that the Reconstruction Finance Corporation had come to the end of its funds available for aiding industry, the total of its commitments stood at December 1, 1935, at \$6,548,000,000. The table on pp. 615-617 showing total receipts and expenditures indicates the situation of the government as made public at the end of the calendar year.

ORDINARY RECEIPTS, EXPENDITURES CHARGEABLE AGAINST ORDINARY RECEIPTS, AND SURPLUS 1922 TO 1935

[On basis of daily Treasury statements (unrevised)]

Fiscal year	Total ordinary receipts	Expenditures chargeable against ordinary receipts	Surplus
1922	4,109,104,150	3,795,302,499	313,801,651
1923	4,007,135,480	3,697,478,020	309,657,460

1934	3,115,000,000	7,105,050,085	3,989,496,035 ^{a, b}
1935	4,030,127,436	7,112,556,079	3,082,128,643 ^b

^a Including an increase in emergency expenditure from \$1,277,000,000 to \$4,004,000,000. ^b Deficit.

Banking and Financing Policy of the Treasury. The habit of relying upon the banks to fill up deficits in the Treasury which had been acquired during the later years of the Hoover Administration and had grown fixed during the first two years of the Roosevelt period, now became almost unalterable. Secretary Morgenthau, who had taken office in the late autumn of 1933, had continued during 1934 to get what funds he needed by placing short and long term securities of every description in the hands of the banks. The financing of the year 1935 did not differ materially from that of 1934 although greater hesitation and doubt was exhibited by Federal administrators concerning the safety of the projects which they were carrying through. At various times during the year there was hesitation and on one

or two occasions a government bond panic apparently impended, being averted by the use of the funds of the Treasury in buying and operating in the bond market. In fact these operations were frankly admitted, the Treasury at one time (November, 1935) reporting that it had used as much as \$60,000,000 during the month for the purpose of buying securities and upholding the market.

Conditions grew more and more delicate on account of the tendency of bankers in many parts of the country to dispose of government obligations after they had acquired them, thereby keeping their net holdings down to what they considered a moderate figure. This policy obviously tended to limit the field for the placement of new issues of bonds. At the end of the calendar year the total holdings of government securities by all banks were at a high point. They had been estimated by the governor of the Federal Reserve Board at a Congressional hearing in May, 1935, as 60 per cent of the outstanding debt—probably about 18 billions of dollars, or more, of which the reporting member banks of the Federal Reserve system (on Dec. 31, 1935) held some 6 billions.

The Treasury continued the same policy as before, of offering securities at very low prices and at one period of the year undertook to sell them by auction, thereby tending to disorganize existing methods of distribution and to loosen the artificial support which the government bonds were receiving. The method was revoked after a couple of months, fairly late in the year. The average yield of government securities continued low, at one time reaching a point near 2.60, while at the end of 1935 it was probably in the neighborhood of 2.68 per cent. Nevertheless, the Treasury was able to carry through with substantial success its entire programme for the year which included the acquisition of some five billion dollars of new money through the extensive process of refunding old issues that had matured. The farce of pretending that offerings were greatly oversubscribed was largely abandoned—a step which added greatly to the sincerity and straight-forwardness with which Treasury affairs were conducted. So low, however, was the yield on securities that private investors very largely ceased to hold them and they became almost exclusively a banking and money market type of paper, although the banks were increasingly disposed to limit themselves to very short term maturities.

The Debt. In the table on pp. 619-620 the position of the debt as it existed at the close of the year 1935 is presented.

More than ever in the past, the increase of early refundable debts, the result of short term maturities, became worthy of comment and tended to cause in the financial community a feeling that conditions were in a very unstable situation. Toward the end of the year an address made by the President put forward the statement that he had been informed at the time of the bank holiday by "great bankers" that the country was capable of carrying indebtedness up to 70 billions of dollars. This precipitated a general discussion as to the amount of burden which the nation could probably support in the form of vested indebtedness, with the result that a good many persons became inclined to the view that the enlargement of debt that was going on was by no means so hazardous in comparison with the situation in other countries as had been supposed. The more cautious analysts were disposed to take note of the circumstances that the burden or weight of the debt was

PRELIMINARY STATEMENT OF THE PUBLIC DEBT, DEC. 31, 1935

Series maturing Sept. 30, 1936	50,000,000 00	2,404,192,000.00
Total interest-bearing debt outstanding		29,596,328,977.50
Matured debt on which interest has ceased:		
Old debt matured—issued prior to Apr. 1, 1917	5,059,440.26	
3½%, 4%, and 4¼% First Liberty Loan bonds of 1932-47	59,753,650.00	
4% and 4¼% Second Liberty Loan bonds of 1927-42	1,648,100 00	
4¼% Third Liberty Loan bonds of 1928	2,656,400 00	
4¼% Fourth Liberty Loan bonds of 1933-38	92,640,200.00	
3¾% and 4¾% Victory notes of 1922-23	757,400 00	
Treasury notes, at various interest rates	17,096,450 00	
Certificates of indebtedness, at various interest rates	10,010,100 00	
Treasury bills	34,356,000 00	
Treasury savings certificates	316,775 00	224,294,515.26
Debt bearing no interest:		
United States notes	346,681,016 00	
Less gold reserve	156,039,430 93	
	190,641,585 07	
Deposits for retirement of national bank and Federal Reserve bank notes	540,742,451 50	
Old demand notes and fractional currency	2,034,903 82	
Thrift and Treasury saving stamps, unclassified sales, etc.	3,281,629 54	736,700,569.93
Total gross debt		30,557,324,062.69

COMPARATIVE PUBLIC DEBT STATEMENT

(On the basis of daily Treasury statements)

	Mar. 31, 1917, pre-war debt	Aug. 31, 1919, highest post-war debt	Dec. 31, 1930 lowest post-war debt	Dec. 31, 1934, a year ago	Nov. 30, 1935, last month	Dec. 31, 1935
Gross debt ...	\$1,282,044,346.28	\$26,596,701,648.01	\$16,026,087,087.07	\$28,478,663,924.70	\$29,634,021,333.94	\$30,557,324,062.69
Net balance in general fund	74,216,460.05	1,118,109,534.76	306,803,319.55	2,563,845,517.46	1,434,388,082.00	2,208,733,788.67
Gross debt less net balance in general fund	1,207,827,886.23	25,478,592,113.25	15,719,283,767.52	25,914,818,407.24	28,199,633,251.94	28,348,590,274.02

entirely a matter of the burden or extent of the taxation to be imposed and the opinion was quite general that with taxes as they stood (and without some concerted effort to push the line of exemption very much farther down) the debt of the United States could not safely be much enlarged.

Legislative Prospects. Legislative prospects at the end of 1935 were conflicting. Some official statements had been put out within the preceding 60 days and were broadly repeated in the Presidential annual message to the effect that no new taxation or legislation was to be expected in the new Congress. The fact remained that both the tax and the currency situations were chaotic and that non-partisan persons recognized the necessity of a thorough overhauling of both. Fears of a breakdown of the current monetary situation were frequent and intense. Although the revival of business, especially on the sales side, toward the latter part of the year, had been encouraging; there was no improvement in public finance of corresponding dimensions, and pessimism on the part of the informed section of the community with regard to the fiscal position of the government was correspondingly unrelieved.

PUBLIC UTILITY ACT. See ELECTRIC LIGHT AND POWER INDUSTRY.

PUBLIC UTILITY HOLDING COMPANY ACT. See UNITED STATES under Congress; LAW.

PUBLIC WORKS ADMINISTRATION (PWA). See MUNICIPAL OWNERSHIP; UNITED STATES.

PUERTO RICO, pwër'tō rē'kō. An American island possession in the West Indies. Capital, San Juan.

Area and Population. Puerto Rico has an area of 3435 square miles and a population estimated on July 1, 1934, at 1,648,601 (1,543,913 at the 1930 census). With 449.5 inhabitants to the square mile in 1934, the island was one of the world's most densely populated places. Births in 1934 numbered 65,595 (39.8 per 1000 of population) and deaths numbered 31,703 (19.2 per 1000). In 1930, 74.3 per cent of the population was classed as white and 25.7 per cent as Negro. There were about 2000 continental Americans and 5000 Spaniards on the island in 1930. The chief cities, with their 1930 populations, are: San Juan, 114,715; Ponce, 53,430; Mayaguez, 37,060; Caguas, 19,791. Spanish is the chief language but English is widely used. Roman Catholicism is the prevailing religion.

Education. Primary education is compulsory, but 41.4 per cent of those 10 years of age or over in 1930 were illiterate. In 1935 there were 2121 public schools, with a total enrollment of 246,414 pupils (239,495 in 1934), distributed as follows: Elementary rural schools, 123,910; elementary urban schools, 106,761; high schools, 8587; second unit rural schools, 7158. The number of teachers was 5077 and the educational budget for 1934-35 was \$3,740,089, or 26.87 per cent of all expenditures. Enrollment in the University of Puerto Rico in 1934-35 was 3724, including 407 in the

College of Agriculture and Mechanic Arts at Mayagüez and 30 in the School of Tropical Medicine.

Production. The 1930 census showed 52.4 per cent of the working population engaged in agriculture, fishing, and mining; 22.1 per cent in manufacturing; 11.4 per cent in trade and transportation; and 9.6 per cent in domestic and personal service. Production of the chief crops in 1934-35 was: Sugar, 773,021 short tons (1,103,822 in 1933-34); tobacco, about 22,500,000 lb. (25,000,000 in 1933-34); coffee, 7,000,000 lb. (9,000,000); grapefruit, 800 boxes; pineapples, 500,000 crates. The sugar quota allotted Puerto Rico under the Costigan-Jones Act was 802,842 short tons raw value for 1934 and 786,814 short tons for 1935. Cotton, cacao, coconuts, beans, plantains, and vegetables also are grown. Manganese and salt are the principal mineral products. The chief manufactures are refined sugar, cigars and cigarettes, garments, fine needlework, and canned and preserved fruit. Sugar grinding mills numbered 41 in 1934.

Overseas Trade. For the fiscal year 1934-35 imports into Puerto Rico were valued at \$69,985,938 (\$63,924,883 in 1933-34) and exports totaled \$79,677,688 (\$85,971,974 in 1933-34). The United States supplied imports valued at \$63,573,573 (\$57,503,315 in 1933-34) and purchased exports to the value of \$77,602,195 (\$83,214,473 in 1933-34). The chief exports to the United States in 1934-35 were: Raw sugar, \$40,470,061; wearing apparel, \$11,645,492; refined sugar, \$7,922,271; unmanufactured tobacco, \$7,146,428; molasses, \$2,098,703; linen handkerchiefs, \$1,036,727. Rice, wheat flour, cigarettes, cotton sheetings, oil products, etc., were leading imports.

Finance. Total general fund receipts of the Insular Government during the fiscal year 1934-35 were \$13,561,333, including revenue receipts of \$12,642,828, and expenditures totaled \$12,917,412, leaving a surplus of \$643,921. The final liquidation of general fund operations for the year showed an excess of resources over liabilities on June 30, 1935, of \$606,477, compared with a deficit of \$278,984 a year earlier. The bonded indebtedness of the government on June 30, 1935, was \$27,480,000, representing a reduction of \$395,000 since June 30, 1934.

Communications. Puerto Rico in 1935 had about 307 miles of railway lines, more than 1100 miles of hard-surfaced roads, and some 500 miles of graded dirt roads. San Juan is on the Pan American Airways circuit. San Juan and Mayaguez are the chief ports. During 1934-35 the entrance channel and harbor of San Juan were widened and deepened, enabling the larger tourist ships to enter without difficulty. During 1933-34 a total of 1628 overseas vessels of 2,713,833 gross tons entered and cleared Puerto Rican ports.

Government. The basic law of Puerto Rico is the Jones Act passed by the U. S. Congress Mar. 2, 1917, and subsequently amended. This Act conferred American citizenship collectively upon the inhabitants. Executive power is vested in a governor appointed by the President of the United States and legislative power in a legislature of two houses—the Senate of 19 members and the House of Representatives of 39 members, all elected for four years by universal male and female suffrage. A resident commissioner, elected for four years, represents the island in the United States Congress. The seven departmental heads form an executive council presided over by the Governor. Governor

in 1935, Maj. Gen. Blanton Winship. Resident Commissioner in the United States, Santiago Iglesias, elected Nov. 8, 1932.

HISTORY

Economic Recovery. In his Annual Report covering the fiscal year 1934-35, Governor Winship reported a marked economic improvement over the conditions of the previous year. He said that merchants and industrialists had had a profitable year, employment had increased slightly, bank deposits and savings rose while bank loans decreased, the construction trades had experienced a marked expansion, and the farmers had enjoyed a fairly good season. These improved conditions he attributed mainly to the large sums disbursed by the Puerto Rican Emergency Relief Administration and other Federal agencies. The improvement in the government's financial position was especially marked, tax revenues being the largest for any year since the establishment of the American civil government.

On the other hand, the Governor pointed out that unemployment was still very great and that the exodus of the rural population to urban centres continued and was "not expected to decrease until the Puerto Rico Reconstruction Administration has well under way the execution of its broad plans for the island's rehabilitation." He also emphasized the fact that although the activities of the various Federal emergency organizations had been "of tremendous assistance in maintaining the island socially and economically during these years of the depression," Puerto Rico had not received its due share of these funds. It was estimated late in 1935 that there had been allotted to Puerto Rico \$64,000,000, whereas on a par capita basis the island should have received \$157,000,000.

Rehabilitation Programme. The Puerto Rican Emergency Relief Administration, headed by James Bourne, had been spending \$1,000,000 monthly for a work relief programme supporting 75,000 persons, chiefly heads of families. After repeated delays a comprehensive plan for permanent economic and social rehabilitation of the overcrowded island was launched by President Roosevelt late in May, under authority conferred on him by the Emergency Relief Act of 1935. The Puerto Rico Reconstruction Administration was established, with Dr. Ernest Gruening as director. Its major objectives were the breaking up of the large agricultural holdings, owned largely by United States capitalists, and redistribution of the land among the thousands of families dependent upon Federal relief. In 1900 Congress had limited corporate holdings in the island to 500 acres but the law had been disregarded by sugar planters and others, with the result that in 1935 one-third of the cultivated area was in holdings of more than 500 acres.

A fund of \$42,000,000 was allotted to the PRRA for the first fiscal year. About three-fourths of this was to be spent on the land redistribution and rural rehabilitation programme and the remainder on related projects, as follows: Housing and slum clearance, \$2,200,000; reforestation, forestation, and prevention of soil erosion, \$994,144; new buildings and equipment for the University of Puerto Rico, \$1,197,068; rural electrification, \$2,727,600; cattle tick and coconut budrot eradication, \$306,740; rural rehabilitation and land utilization, \$5,917,840; rural resettlement, \$8,374,000; rehabilitation of coffee, tobacco and citrus fruit farms, \$7,909,600;

establishment of coöperative sugar centrals, coffee mills, cold-storage plants, etc., \$4,000,000.

Dr. Gruening was confronted from the beginning of his task with successive reductions in the original PRRA appropriation, with criticism and obstruction on the part of the coalition in control of the insular Legislature, and with legal obstacles to the progress of his programme. Pending the beginning of work on all the PRRA projects, the Relief Administration was obliged to continue its temporary activities. However by the end of November, 1935, more than 8700 persons had been transferred from temporary relief to PRRA projects and an additional 1500 non-relief workers had been engaged. The PRRA employment rolls were expected to increase at the rate of about 2500 weekly until the projects were fully manned. The cornerstone of a new library at the University of Puerto Rico was laid December 21, inaugurating a \$1,000,000 building project. On December 31 Dr. Gruening announced the purchase of the first land in connection with the rural rehabilitation programme—a 4400 acre tract owned by a subsidiary of the American Tobacco Co. Recognizing that this programme could only prove successful on a long-term basis, the PRRA asked Congressional authority to extend the expenditure of PRRA funds up to 1940, instead of to June, 1937, as required on other Federal Emergency Relief Administration projects. Congress failed to act on the measure in 1935 and it was to be reintroduced in 1936.

Statehood vs. Independence. The pressing nature of Puerto Rico's economic and social problems and the extent of Federal assistance brought to a head in 1935 the long-debated issue of Statehood versus independence. None of the island's political parties were satisfied with its existing political relationship to the United States. But while the government parties, representing a coalition of the Union Republicans and Socialists, favored Statehood as a means of obtaining unrestricted autonomy, the Liberals and Nationalists espoused full independence. The Liberals adopted a policy of cooperation pending achievement of independence, but the numerically small Nationalist party assumed an intransigent attitude and refused to participate in elections or to permit its members to hold office in the insular government.

A bill authorizing the Puerto Rican Legislature to draft a Constitution and become the 49th State in the American Union was introduced in Congress early in 1935 and hearings on the bill were opened before the Committee on Territories in June. The hearings were to be resumed when Congress reassembled in 1936. Meanwhile the Nationalist agitation had assumed considerable momentum, especially after a clash between the police and armed Nationalists in the university town of Rio Piedras on October 24, in which four Nationalists were killed. At the funeral services, attended by 8000 persons, the Nationalist leader, Pedro Albizu Campos, asked all present to raise their right hands and swear to avenge the "murdered national heroes, fallen for their country's honor."

Legislation. The third regular session of the Thirteenth Legislature convened on Feb. 11, 1935, and adjourned *sine die* on April 14, after passing 103 bills and 99 joint resolutions, of which the Governor approved 47 bills and 37 joint resolutions. The measures passed included the restriction of appeals from decisions of the Public Service Commission, extension of the suffrage to illiterates of both sexes, and the extension of the public

electric power lines to San Juan, Ponce, and Adjuntas for use for public purposes only.

The Coalition Government had been at loggerheads with Relief Administrator Bourne on the ground that he had not consulted it in connection with the administration of his office. Accordingly the Legislature adjourned several days earlier than usual, without acting on a number of important bills, in protest against the alleged dictatorial attitude of the Washington Government. Governor Winship recalled the Legislature in special session from June 25 to July 8, during which 49 additional bills and 16 joint resolutions were passed and received the Governor's signature. The budget bill called for expenditures in 1935-36 of slightly more than \$11,000,000, an increase resulting from the partial restoration of the salary reductions imposed on teachers and police, the employment of 200 continental American teachers of English, and the extension of health and agricultural services. To offset these larger expenditures, inheritance taxes were increased and higher income taxes were imposed, but the latter bill was vetoed by the Governor because of certain defects.

A number of acts were passed permitting Puerto Rico to take full advantage of Federal appropriations; giving effect to the United States law of 1900 restricting land holdings to 500 acres; regulating the branding and sale of coffee, regulating gambling in connection with horse racing and clandestine lotteries; limiting the hours of employment to eight per day. A new Workmen's Compensation Act went into effect July 1, 1935.

Consult Harwood Hull, "Better Times for Puerto Rico," *Current History*, January, 1936.

PULITZER PRIZES. A series of awards established in 1915 by the will of Joseph Pulitzer, publisher of the *New York World*, to be presented annually by Columbia University, on recommendation of the advisory board of the Pulitzer School of Journalism, for outstanding achievements in letters and journalism. The value of the prizes in the group devoted to letters is \$1000, with the exception of that for the best work on the history of the United States which is \$2000. The value of the prizes in the journalistic group is \$500, with the exception of that for the best example of a reporter's work during the year, which is \$1000.

The awards for the year 1934 were announced on May 6, 1935. In literature, prizes were as follows: for the best novel by an American author, *Now in November*, by Josephine Winslow Johnson, was adjudged the outstanding work; for the best drama, *The Old Maid*, by Zoe Akins, based on a story of old New York by Edith Wharton, was the selection of the committee; for the best volume of verse, *Bright Ambush*, by Audrey Wurdemann (Mrs. Joseph Auslander); for the best book dealing with the history of the United States, *The Colonial Period in American History*, by Prof. Charles McLean Andrews of Yale University; for the best American biography, *R. E. Lee*, a four-volume study of the Confederate States leader, by Douglas Southall Freeman.

In journalism, the gold medal for "the most disinterested and meritorious public service rendered by an American newspaper" was awarded to the *Sacramento (Calif.) Bee* for publishing a series of articles by Arthur B. Waugh that led to the withdrawal of the nominations of two men for Federal judgeships. For distinguished service as a foreign or Washington correspondent, the award for 1934 was presented to Arthur Krock, Washington correspondent of the *New York Times*, for his articles

reflecting scenes in the capital under the New Deal. For a distinguished example of a reporter's work, the award was given to William H. Taylor, a sports writer on the New York *Herald Tribune*, for his stories on the America's Cup races. The prize for the best example of a cartoonist's work went to Ross A. Lewis of the *Milwaukee Journal* for the cartoon published Sept. 1, 1934, over the caption, "Sure, I'll Work for Both Sides." No editorial published during the year was adjudged sufficiently meritorious to receive an award.

PUPIN, pû-pên', MICHAEL IDVORSKY. An American physicist and inventor, died in New York City, Mar. 12, 1935. Born at Idvor in the Banat of Hungary, of Serbian ancestry, Oct. 4, 1858, he attended school in his native country and at the age of 16 came to the United States to seek his fortune. Working day by day, and attending Cooper Union in New York at night, he saved enough with which to enter Columbia College in 1879. He received the A.B. degree in 1883. Under the first John Tyndall Fellowship, he studied abroad at Cambridge, England, and at Berlin under Van Helmholtz. From the latter university he received the degree of Ph.D., for his mathematical dissertation, *Osmotic Pressure and Free Energy*. He returned to America to become assistant teacher of electrical engineering at Columbia, and became successively instructor of mathematical physics (1890-92); adjunct professor of mechanics (1892-1901); professor of electromechanics (1901-31), and professor emeritus (1931). From 1911 he served as director of the Phoenix Research Laboratories.

One of the foremost physicists in the world, Dr. Pupin's researches were connected principally in electrical resonance, in theoretical and experimental consideration of the magnetization of iron, and electrical-wave propagation. He had many inventions to his credit, the most important being a system of multiplex telegraphy accomplished by electrical tuning (1894), later acquired by the Marconi interests; the Pupin coil, a telegraph or telephone cable through which transmission was made more effective by the use of inductances located at regular intervals. (For a detailed account of this invention, see the article *Telephone* in *THE NEW INTERNATIONAL ENCYCLOPEDIA*). In 1901 he sold the patent to the Bell Telephone Company and the German telephone interests for one of the largest sums ever given to an inventor, said to be about a million dollars. During the World War (1914-17) he worked on and completed an invention to overcome static resistance to wireless telegraphy. At the time of his death he was working, with the aid of an assistant, on electric circuits, particularly in conjunction with submarine transmission. His scientific discovery of secondary X-ray radiation, and the production of a photographic method whereby the time of exposure was shortened from about an hour to a few minutes (1896) were no less important.

An ardent patriot, he was nevertheless deeply interested in the affairs of Serbia, and in 1912 was appointed Honorary Consul General in New York City by that Government, from which he resigned in 1920. During the World War he was an active exponent of the Serbian cause, and in 1915 organized a group of Columbia students who went to Serbia to do relief work. He served also as a member of the National Research Council and the National Advisory Committee for Aeronautics, and in 1919 attended the Paris Peace Conference

as a scientific adviser. In 1930 the Yugoslav Government conferred on him its highest decoration—the Order of the White Eagle.

For his scientific achievements, Dr. Pupin received many honors, foremost among which were the Herbert Prize of the French Academy (1916); the Edison Prize for his work in mathematical physics (1921); Gold Medal of Honor, Institute of Radio Engineers (1924); the Washington Medal for engineering of the Western Society of Engineers (1928) and the John Fritz Gold Medal of the American Institution of Electrical Engineers in conjunction with other engineering societies. A fellow of the American Association for the Advancement of Science, he was its president, 1925-26, and held membership in the National Academy of Sciences, and the American Institute of Electrical Engineers, president 1925-26.

Pupin's writings include: "Electrical Oscillations of Low Frequency and Their Resonance," in the *American Journal of Science* (1893); *Resonance Analysis of Alternating Currents* (1894); *Electro-Magnetic Theory* (1895); "Propagation of Long Electrical Waves," *Transactions, American Institute of Electrical Engineers* (1899); "Wave Propagation over Non-Uniform Conductors," *Transactions, American Mathematical Society* (1900); *Immigrant to Inventor*, his biography, for which he received the Pulitzer Prize Award in 1924 (1923); *The New Reformation* (1927); *Romance of the Machine* (1930).

PURDUE UNIVERSITY. A State technological institution in Lafayette, Ind., founded in 1869. The enrollment for the autumn of 1935 was 4615; registration in the 1935 summer session was 793. There were 371 members on the faculty. The endowment amounted to \$340,000, and the income for the year was \$3,617,560. The library contained 120,000 volumes. A common programme of studies was established for all freshmen entering the engineering schools, and a combined engineering-law curriculum and a public service curriculum were introduced. President, Edward C. Elliott, Ph.D.

PYROMETALLURGY. See METALLURGY.

QATAR. See under ARABIA.

QUEBEC, kwê-bek'. A Province of Canada. Area, 594,534 sq. miles; population (1935 estimate), 3,062,000 compared with 2,874,255 (1931 census). During 1934, there were 76,432 living births, 31,923 deaths, and 18,242 marriages. Chief cities (with 1931 populations): Montreal (818,577), Quebec, the capital (130,594), Verdun (60,745), Three Rivers (35,450), Hull (29,433), Sherbrooke (28,933), Outremont (28,641). In 1933, there were 677,250 pupils in the 8576 schools (including high, superior, and normal schools). The four universities (McGill, Bishop's, Laval, and Montreal) had 22,863 students enrolled during 1933-34.

Production. The preliminary estimated value of field crops for 1935 was \$85,711,000 (\$98,309,000 in 1934) of which hay and clover (5,116,000 tons) accounted for \$44,151,000; oats (45,570,000 bu.), \$19,595,000; potatoes (562,760 tons), \$8,674,000; turnips, etc., \$3,131,000; fodder corn, \$2,237,000; barley, \$2,062,000; buckwheat, \$1,983,000; mixed grains, \$1,815,000; wheat, \$1,130,000. Live-stock in 1934: 1,725,600 cattle, 612,000 sheep, 551,400 swine, 264,500 horses. Fur production (1933-34): 307,819 pelts valued at \$1,479,811 of which silver fox (22,690 pelts) represented \$762,212. The fisheries catch (1934) was valued at \$2,306,517.

Mineral production (1934) was valued at \$31,-

269,945 of which gold (390,097 fine oz.) accounted for \$13,458,347; copper (73,968,545 lb.), \$5,487,948; silver (470,254 fine oz.), \$223,187; asbestos (155,980 tons), \$4,936,326; magnesitic dolomite, \$382,927. Mineral production (1935): gold, 474,746 fine oz., valued at \$16,706,312; copper, 77,555,112 lb. During 1933, from the 8384 factories, with 163,571 workers, the net value of products was \$360,115,939.

Government. For the year ended June 30, 1935, ordinary revenue amounted to \$31,984,885; ordinary expenditure, \$36,924,121; net funded debt, \$118,935,750. Budget estimates (1935-36): ordinary revenue, \$33,580,478; ordinary expenditure, \$35,877,393. The Province was administered by a lieutenant-governor aided by a responsible ministry, a legislative council of 24 members appointed for life, and a legislative assembly of 90 members (47 Liberals as against 42 for the opposition—made up of Conservatives, Action Nationale Libérale, and National Unionists—were elected at the Provincial general election of Nov. 25, 1935; one seat was in dispute). Quebec was represented in the Dominion Parliament by 24 Senators (appointed for life) and 65 members in the House of Commons (56 Liberals, 5 Conservatives, and 4 Independent Liberals were elected at the Dominion general election of Oct. 14, 1935). Lieutenant-Governor, E. L. Patenaude; Premier, L. A. Taschereau (Liberal). See CANADA under *History*.

QUEENS-CHICORA COLLEGE. A college for women in Charlotte, N. C., founded in 1857; nonsectarian in purpose but under the direction of the Presbyterian Church. The enrollment for the autumn term of 1935 was 354. There were 30 members on the faculty. The endowment amounted to \$336,000, and the income for the year was \$15,000. The library contained approximately 14,000 volumes. President, William H. Frazer, D.D.

QUEENSLAND. A State of Australia. Area, 670,500 sq. miles, population (Mar. 31, 1935), 962,213 exclusive of 16,957 (1933 census) aborigines (12,532 full-blood and 4425 half-caste). During 1934 there were 17,300 births, 8192 deaths, and 7635 marriages. Chief towns (with 1933 census populations): Brisbane, 299,782; Rockhampton, 29,373; Toowoomba, 26,430; Townsville, 25,872; Ipswich, 22,499. In 1933 there were 1933 schools of all kinds with a total enrollment of 190,884.

Production. Sugar cane, wheat, bananas, pineapples, maize, tobacco, grapes, cotton, hay, and oranges were the important agricultural products. Livestock in the State (1934): 21,134,633 sheep, 5,982,074 cattle, 439,606 horses, and 217,448 (1933) pigs. Production (1933-34): Wool, 169,989,516 lb.; butter, 127,343,160 lb.; cheese, 13,887,233 lb.; bacon and ham, 18,881,267 lb. Mineral production (1934) was valued at \$2,773,373 including gold (115,471 oz. fine), £982,636; silver and lead, £671,255; copper, £95,903; tin, £179,404; coal (956,558 tons), £752,303. During 1933-34 the value of production from the 2345 factories, with 40,083 employees, was £13,712,508.

Government. For the year ended June 30, 1935, revenue amounted to £15,280,000; expenditure, £15,845,000; gross public debt (June 30, 1934), £117,817,352 (£ Australian averaged \$4,0095 for 1934). Budget estimates (1935-36): Revenue, £15,036,810; expenditure, £16,199,183. Executive power was vested in a governor, and legislative power in a parliament consisting of a legislative assembly of 62 members elected for three years. Legislative Assembly (elected May 11, 1935): 45 Labor, 14 Coun-

try, and 3 Nationalist. Governor in 1935, Lieut.-Col. Sir L. O. Wilson; Premier, W. F. Smith. See AUSTRALIA.

RACING. Alfred Gwynne Vanderbilt, America's youngest sportsman who breeds and races thoroughbreds, dominated the American turf in 1935, the most successful season from almost every standpoint in 10 years. Vanderbilt's stable accounted for an unusual amount of important stakes and also for the handsome total of \$302,955 in prize money. That sum, more than a third of it accounted for by the master handicap horse, Discovery, was one of the bright spots of the campaign. Omaha, William Woodward's three-year-old, was the other bright spot. He won six races, was second once and third twice, and was the leading money winner of the year with \$142,255.

Omaha won a conditioning race, was third to Cornelius Vanderbilt Whitney's Today and Mrs. Payne Whitney's Play Eye in his second start—in the Wood Memorial, in which he was bumped at the start. He then won the Kentucky Derby, the Preakness, the Belmont, the Dwyer, and the Arlington Classic before he went lame late in the season. He was beaten by Rosemont in the Withers—a mile race—a distance a bit short for a slow beginner. He went out of his class in the Brooklyn Handicap and was content with third to Discovery and King Saxon in which Discovery hung up a new world's record of 1:48½ for a mile and a furlong. Firethorn was probably the second best three-year-old—being runner-up to Omaha in both the Preakness and Belmont, winning the Lawrence Realization and the Jockey Club Gold Cup and the Washington Handicap. He wasn't eligible for the Kentucky Derby.

Though Alfred Vanderbilt's Discovery finished behind Omaha and Fred Alger's Azucar (winner of the \$100,000 Santa Anita Handicap) in the matter of money winning, he was easily the outstanding horse of the season. Once this son of Display found himself in the Brooklyn Handicap, he was invincible, impervious to everything but overpowering weight. Discovery was beaten in each of his first three starts—the Toboggan, Metropolitan and Suburban Handicaps. Then he won eight successive stake races, traveling all over the country to do it. He beat Azucar in the Detroit Challenge Cup, won the Stars and Stripes at Arlington Park, The Butler at Empire City, The Bunker Hill at Suffolk Downs, The Arlington Handicap, the Wilson, the Merchants', and the Citizens' Handicaps. In the Narragansett Special Discovery, under 139 lb. was beaten by Top Row, carrying a burden twenty-nine pounds less. He also bowed to Top Row in the Massachusetts Handicap. He finished the season by winning the Whitney, the Hawthorne Gold Cup and the Coney Island Special.

William Woodward, Omaha's owner, was second to Vanderbilt in money winning, taking down \$195,860. C. V. Whitney was third with \$147,830, and E. R. Bradley fourth with \$142,455. C. Stevenson was high jockey with 205 winners in 961 mounts, topping Wayne Wright by 14 winners. Wright also rode 961 horses. R. Workman had the best percentage among the jockeys, riding 514 mounts, finishing first 121 times, second 73, and third 60. Hirsch Jacobs, for the third successive year, topped American trainers when he saddled 109 winners.

C. H. Knebelkamp's King Saxon was the season's best sprinter, and that after a rugged winter of racing in Florida. The two-year-old situation

was muddled with no youngster standing out at the end of the season. Slight weight shifts would enable the best to avenge previous defeats the next time out. C. V. Whitney's Red Rain, winner of the Hopeful, Marshall Field's Tintagel, Futurity victor, Coldstream Stud's Coldstream which ran a dead-heat with Red Rain in the Saratoga Special, and Hal Price Headley's Hollywood, winner of the Pimlico Futurity, were rated on a par. Bomar Stable's Grand Slam, winner of the Arlington Futurity, Vanderbilt's Postage Due, United States Hotel Stakes winner, and Ogden Phipps White Cockade were all well considered.

The Aga Khan's Bahram won the English Derby by two lengths from Sir Abe Bailey's Robin Goodfellow, an outsider. It was Bahram's seventh straight victory and the second Derby for the Aga Khan, whose Blenheim won in 1930. Major Noel Furlong's Reynoldstown, an outsider at 22 to 1, ridden by the owner's son, Frank, won the Grand National Steeplechase at Aintree, Liverpool, by three lengths from Lady Lindsay's Blue Prince.

Harness Racing. While none approached Peter Manning's long standing world record of 1:56 $\frac{1}{4}$, the speed of the light harness horses in 1935 set new marks for the Grand Circuit meetings and for the half mile tracks as well. It's difficult to name the achievement which excelled, but the feat that made veteran horsemen gasp was the mile in 2:00 by the four-year-old filly, Calumet Evelyn, the first time she trotted in public. And she had won a pacing race in 1:59 $\frac{1}{4}$, fastest time of the season, four days earlier. The two performances at Lexington made her the fastest double gaited harness horse yet to appear.

Tara, another four-year-old filly, showed remarkable speed and stamina in the free-for-all at Goshen in August, going three heats in 2:00, 2:01, and 2:02. Greyhound, 2:00, unbeaten three-year-old of the season ranks with Calumet Evelyn, and Tara. His fastest heat was in at Springfield, Ill, but his greatest performance was his victory in the \$33,000 Hambletonian at Goshen. He won consecutive heats in 2:02 $\frac{1}{4}$ and 2:02 $\frac{1}{4}$. Rosalind, 2:03, winner of the Kentucky Futurity, was the outstanding juvenile trotter of the campaign. Besides Calumet Evelyn, the ranking pacers of the season were Laurel Hanover, 1:59 $\frac{1}{4}$, Cardinal Prince, 1:59 $\frac{1}{2}$; J. E. Vonian, 1:59 $\frac{1}{4}$; Theo Guy, 2:00, and Dominion Grattan, 2:00.

Steeplechasing. Reynoldstown, winner of the Grand National probably rates in this category, but his race ranks with the thoroughbred races of the world. In the United States, all jumping honors of note were split among four sons of Stefan the Great. John Schiff's Indigo was the leading timber topper and J.W.Y. Martin's Luckite was the best brush horse of the season. Mrs. T. W. Durant's St. Francis, another son of Stefan, won the hurdle championship and was a fine brush horse. And the fourth son, J. E. Widener's Bush-ranger, was best brush horse on the race tracks, and later tried flat racing and won the Whitney Gold Vase at the United Hunts meeting. Mrs. Marion DuPont Somerville's stable sent out 32 winners. Carroll K. Bassett was the leading rider with 22 victories.

RACKETEERING. See CRIME; NEW YORK.
RADCLIFFE COLLEGE. A nonsectarian college for women in Cambridge, Mass., founded in 1879. The enrollment for the autumn of 1935 was 1000. Instruction was given by 380 teachers from

Harvard University. The productive funds amounted to \$5,020,467 and the income, including tuition, for college purposes, was \$507,635. The library contained 80,000 volumes, exclusive of pamphlets. President, Ada Louise Comstock, Litt.D.

RADIO. The two outstanding new developments in the radio art in 1935 were the introduction of the "all-metal" radio tubes by the General Electric Company, and the demonstration of broadcasting and reception by "frequency modulation" by E. H. Armstrong inventor of the "feed-back" and "superheterodyne" circuits.

The all-metal tubes (made of steel) are smaller than glass tubes, and the metal case acts as a shield from other electrostatic and magnetic fields. The essential feature which makes this construction possible is the new "seal" by which the various connecting conductors are carried into the inside of the case and insulated from the case by beads of glass which make an air tight seal. This was made possible by the development of a special metal, and special glass which have the same coefficient of expansion with heat, thus keeping the seal tight in spite of the heating and cooling of the tubes during operation. Because the tubes are metal and black they will dissipate heat more rapidly than glass tubes and thus will remain cooler or can be made smaller for the same necessary rate of heat dissipation.

Armstrong's invention was an attempt to eliminate the disturbances caused by "static" of all kinds. The usual broadcast systems impressed the voice modulations on the carrier wave by varying the strength or intensity of that wave, which is also what static does to the wave, suddenly altering its strength. Armstrong decided to vary the frequency of the carrier, that is, change the number of waves per second sent out by the transmitter. This is a characteristic of the carrier which is not acted upon by static. The principle had been proposed and discussed before but there was no way known of reducing it to practice. Armstrong accomplished this by means of phase modulation and correction. His invention's principal disadvantage is that it requires a wider wave band or channel than the more usual method. The demonstration was carried on at ultra-high frequencies, in some cases at 150 megacycles or 2 meter wave length. At these high frequencies the width of the channel or band is not as important as at the lower frequencies of broadcasting.

In the commercial broadcasting field an improvement in fidelity of reproduction was accomplished both by changes in the transmitter and improvements in the home receivers. Frequencies from 130 kc. to 60,000 kc. are now in use and some receiving sets will respond to this range although the majority of "all-wave" receivers are adapted to from 500 to 18,000 kc. in four bands. Some of the transmitting antennae have been designed using the tower itself as the main radiator. In some cases an inductance and capacity are connected in series with the tower at the top and this is said to give better radiation. Many new ultra-high frequency broadcasting stations have been installed all over the world and it has become a fad to "fish" for distant stations. One enthusiastic fan reported that he had received and recorded 887 stations aggregating some 916,000 miles of distance. Australia and Java are near neighbors to these fans.

There were 1126 new models of radio receiving sets on the market in 1935, brought out by 110

different manufacturers. Of these 21 per cent of the models and 47 per cent of the manufacturers used the new metal tubes. There were 5,500,000 sets sold, an increase of 17 per cent over 1934. There was an average of 6 tubes per set and the average price was \$73. A considerable improvement was made in the design of the doublet antenna for all-wave reception and various manufacturers sold complete equipments for this purpose.

One million auto radios were sold during the year. The use of the all-steel body for automobiles required ingenuity in the construction of the antenna which is frequently placed under the running board. Radio cars are used by the police in 398 cities. Most of these cars are for one-way communication and have a working range of from 10 to 14 miles. Two thousand vessels now have radio and almost one thousand planes. Of the latter about a third are for two-way communication.

There is an installation of wired radio in Cleveland in which about 400 homes receive radio programmes over the power wires. Radio played a very important part in the stratosphere flight of the balloon *Explorer II* on Nov. 11, 1935, in the Dakotas. Communication by short waves was maintained throughout the whole flight. A portable transmitting and receiving set called a "Transceiver," which may be carried on a man's back, was brought out and used by foresters in the protection of forests from fires. It had a range of from one to ten miles. See INTERNATIONAL LAW; PHYSICS.

National Committee on Education by Radio. Education by radio first received national recognition when on June 6, 1929, Secretary of the Interior Wilbur appointed a committee to study the problems of radio in education. See NEW INTERNATIONAL YEAR BOOK for 1934, p. 609.

The Committee's activities include publishing the periodical—*Education by Radio*; and a service bureau to assist educational stations in securing licenses and in other technical procedures. The Committee called a national conference on "The Use of Radio as a Cultural Agency in a Democracy." This conference, held on May 7 and 8, 1934, adopted a set of fundamental principles which are basic to the setting up of a sound system of broadcasting. The Committee has encouraged research in education by radio and has promoted and coordinated experiments in the use of radio, both in school and adult education. It has sent representatives to state, national, and international conferences and has furnished speakers for important national civic groups.

The chairman of the Committee is Arthur G. Crane, president, University of Wyoming. The vice-chairman is H. J. Umberger, director, division of extension, Kansas State College of Agriculture and Mechanic Arts. The secretary and research director, who administers the Committee's activities, is Tracy F. Tyler. The offices of the Committee are located at 1201 Sixteenth Street, Northwest, Washington, D. C.

RADIOACTIVITY. See CHEMISTRY; PHYSICS.

RAILWAY ACCIDENTS. The number of persons killed in connection with the movement of trains, locomotives, or cars in the United States was reduced from 4816 in 1933 to 4652 in 1934, according to the annual report for the latter year as issued by the Interstate Commerce Commission in January, 1936. Of the persons killed, 435

were employees and 27 were passengers, as compared with 420 employees and 38 passengers in 1933. Trespassers accounted for more than half of the total fatalities. Non-trespassers, chiefly in automobile accidents at grade-crossings, accounted for 1612 deaths in 1934. In the first seven months of 1935, according to a news item issued by the Commission in November, 853 persons had been killed at grade-crossings.

Some of the major accidents throughout the world in the year 1935 were:

January 6. At the Torbine station, 130 miles south of Leningrad, Russia, the Leningrad-Moscow express crashed into the Leningrad-Tiflis express. Twenty-three persons were killed, and 56 seriously injured.

January 8. Near Kostov, in Southern Russia, a rear-end collision caused six deaths and many injuries.

January 29. At Harrison, N. J., a passenger train of the Lackawanna R. R. crashed into a stalled electric train seriously injuring three persons.

February 10. At the Karian-Stroganoff station, about 475 miles southeast of Moscow, Russia, a head-on collision between a passenger train and a freight train resulted in 18 deaths and 9 persons seriously injured.

February 17. Near Tiflis, Russia, three persons were killed and 12 injured when a passenger train ran through an open switch into a freight train.

April 7. On the main line between Ringe and Svengbord, Denmark, a collision between two trains due to faulty signals caused 13 deaths and 57 injured.

April 14. At Marche Prime, France, 3 were killed and 10 injured by a derailment of the Pyrenees Silver Coast Express, caused by a broken flange.

April 17. At Heatherton, Nova Scotia, an express train of the National Railways went off the rails, killing the engineer and four others.

June 16. At Welwyn, 20 miles north of London, England, a news train crashed into the rear of a passenger train killing 14 persons and causing serious injury to 29.

June 21. In a head-on collision in a fog near Deodora, 10 miles from Rio de Janeiro, 4 persons were killed and 20 seriously injured on the Brazilian Central Railway.

July 5. Cloudbursts in eastern Montana undermined the tracks of the Great Northern Railway near Culbertson, and of the Chicago, Milwaukee & St. Paul Railway near Baker, causing wrecks on each line and injuring 22 persons.

August 4. At Neufchatel, France, a train crowded with holiday travelers crashed into a standing freight, causing critical injuries to eight persons.

August 6. In the southeastern Caucasus, Russia, a collision between freight and passenger trains seriously injured eight persons.

August 10. Near Springfield, Ohio, a head-on collision between a work-train of the Cincinnati & Lake Erie and an interurban passenger car killed four persons outright and caused critical injuries to 15 others.

September 14. In the derailment and subsequent burning of a train of tank cars of the Illinois Central R. R. near Monroe, Louisiana, at least 9 transients were killed and 7 were injured.

October 16. Near São Francisco Xavier, Brazil, two passenger trains of the Brazilian Central Railway collided. Eight persons were killed and 83 injured.

December 8. Near Naples, Italy, in disregard of signals, a Sicily express crashed into the rear of the Rome express. Nine passengers were killed and 50 injured.

December 24. At Gross Heringen, Germany, the Berlin-Basle express side-swiped a local train that, loaded with holiday passengers, had just left the station against signals. Several coaches were hurled into the frozen river over which the trains were passing. The known killed numbered 36, with 22 persons critically injured.

RAILWAYS. The sale, on Sept. 30, 1935, of 2,054,492 shares of the Alleghany Corporation carrying control of the Chesapeake and Ohio Railway, the Erie, the New York, Chicago, and St. Louis (Nickel Plate), Pere Marquette, Chicago, and Eastern Illinois, and possibly the Missouri Pacific and the Denver and Rio Grande Western, to a group of men unconnected with the powerful bankers who have heretofore kept control of large railways as their private game preserve, gave a measure of the level to which steam railway credit had sunk by 1935. The Van Sweringen brothers held control of 25,000 miles of railway through a holding company device centering in the Alleghany Corporation. Controlling stock of the Alleghany Cor-

poration was pledged as collateral for a loan from the banking firm of J. P. Morgan. The Midamerica Corporation bidding through L. P. Ayres, Vice President of the Cleveland Trust Company, bought in the block of collateral, of which the common stock of the Allegheny Corporation was the principal item, for \$3,121,000. The loan, including interest, amounted to \$50,000,000. The price received for all of the collateral totaled \$4,703,000.

Bridge Across the Mississippi River. Heretofore there was no bridge across the Mississippi south of Vicksburg. A rail and highway bridge was started at New Orleans. At present, the Southern Pacific trains are ferried across the river at that city. The New Orleans Belt Railway, which is a municipal institution, obtained a loan from the Federal Reconstruction Finance Corporation in 1932 to pay for a bridge across the river at New Orleans. In 1935 the structure was nearly completed. The river span is 3524 ft., 10 in. The east approach is 10,971 ft. The clear head room is 135 ft. See **BRIDGES.** State aid to railways as manifest by the financing of the Moffat tunnel west of Denver, the electrification of the Pennsylvania Railroad, and the bridge building in 1935 across the Mississippi is in contrast with the land grants, etc., given the transcontinental railways earlier.

Coöperation Between Railways. The Minneapolis and St. Louis running west from Minneapolis into South Dakota and south from Minneapolis toward St. Louis, which had for years presented an insoluble problem of profitable, independent operation, was taken over by the Chicago and Northwestern; the Chicago, Burlington, and Quincy; the Chicago, Great Western; the Chicago, Milwaukee, St. Paul, and Pacific; the Chicago, Rock Island, and Pacific; the Great Northern; the Illinois Central, and the Minneapolis, St. Paul, and Sault Ste. Marie railways. Many railway operating men believe that the joint operation of this property will result in economies. The very substantial banker's profits incident to a reorganization were absent in the 1935 solution of a heretofore baffling problem.

Under date of June 12, 1935, Joseph B. Eastman, Federal Coordinator of Transportation, submitted a report to the Regional Coordinating Committees showing the economies that might result from the establishment of a consolidated agency in New York City to take over the fiscal work of railways heretofore conducted through offices maintained separately by railways or through outside agencies. The estimated saving was over three quarters of a million dollars. The sum is not large when compared with total railway expenses, but it is noteworthy because it cuts off a potential source of profit to those who control a railway company.

Eastman Freight Traffic Report. On May 6, 1935, Joseph B. Eastman, Federal Coordinator of Transportation, sent a three-volume report to the Regional Coordinating Committees. It was the first really comprehensive study of the transportation situation in the United States ever made. It was summarized by Mr. Eastman as follows:

The report is the result of concurrent surveys of freight transport operations of all types of carriers. It assembles traffic, service, charge, and operative data, essential to design a coordinated system of transport, utilizing all types of facilities and agencies.

Freight transport tends to become unprofitable because of a surplus of facilities, competitive rate-making and service, and utilization of obsolete equipment, plant and methods as well as less economical modes of transportation.

It appears unlikely that increased production within the immediate future will provide a volume of carrier freight

as large as that which existed prior to 1930. This is true because of the relocation and decentralization in industry, change in power and fuels, and increase of private transportation.

The bulk of American traffic is produced in small towns but principally consumed in large cities. Basic materials are produced in the South and West and processed and largely consumed in the East.

American commerce has definitely assumed a national aspect. This development requires subordination of provincial to national consideration in dealing with carrier relations, facilities, operations, and charges. Modern business demands celerity in movement, universal door-to-door service, and equipment adapted to business needs.

The potential superiority of the railway, resulting from its road speed, is dissipated by voluntary restrictions, infrequent schedules, and frequent yardings and interchanges. As a result, a large volume of carload traffic now moves by highway.

Equipment is now available whereby rail and water carriers can render complete service to all patrons economically.

The motor vehicle is superior in its ability to synchronize its schedules with the patron's needs. Rail and water carriers are handicapped by a limited number of schedules, and by operation of parallel schedules for competitive reasons. Rail carriers have it within their power to reduce, if not to overcome, this handicap.

Carriers can reduce substantially the shipper's cost of transportation by providing vehicles which are shock proofed to reduce packing, fitted with economical temperature control apparatus, and constructed to facilitate cheap loading and unloading.

The present system of freight charges should be reorganized to meet conditions, which have resulted from the ability of the shipper to provide his own transportation.

The present carlot sales unit and minimum weight requirements, no longer adapted to commercial needs, are conducive to uneconomical loading, and tend to divert cargo shipments from the railways. The price scale should vary with the size of shipment, from a ton to a train load, permitting shipments in any amount, but creating an incentive for full instead of minimum loading.

Modern conditions require that all commodities be classified objectively into a limited number of groups, according to nature, utility, and state of processing, and that such groups be rated solely with respect to their potentialities to produce the maximum volume of profitable traffic, excluding consideration of cost characteristics.

The present level of railway rates generally is higher than that of other carriers, and in many cases exceeds the cost to the shipper of providing his own transportation. To assure efficient and stable service, the price level should be designed to make transportation profitable.

The data indicate that different carrier rate structures, in different territories, are no longer justified by present conditions. To avoid discrimination among shippers and uneconomic distribution of traffic between carriers, the present rate structure should be readjusted to evaluate the distinctive cost characteristics of shipments.

Tariff complexity can be reduced and the utility increased by unification of rate systems and publishing authorities, by simplifying commodity classification and by grouping carrier routes into a limited number of definite channels.

Capacity of present transport facilities appears to exceed the prospective demand. Additional facilities are justified only when their economic superiority makes present facilities obsolete, and when demanded by general as distinguished from individual or local welfare.

Additional cost of transport, resulting from the circuit of the average rail shipment, can be reduced by cooperative group routing.

To provide an equivalent amount of transport service the pipe line carriers require the least in capital investment, and the rail carriers the most, if governmental expenditures for waterways and highways be excluded. The cost of operative transport is cheapest in the case of water cargo carriers, and most expensive in the case of rail and water carlot carriers.

Due to the burden of an exclusive transport way, rail and pipe line unit costs for maintenance of fixed plants are relatively the same, and if government expenditures for maintenance of waterways and highways be excluded, much higher than the comparable costs of carriers using such ways.

The data indicate that in thin traffic areas, consideration should be given to the utilization of small power freight cars and light locomotives which manufacturers now offer.

A railway car of shock-proof chassis, with multiple sets of containers, which are interchangeable between railway, waterway, and highway vehicles, accessible for economical loading and unloading and are versatile in design, adapted to present-day sales units, would improve transportation service, reduce its cost, and discourage uneconomic distribution of traffic.

The cost of operating carrier facilities is relatively

greater for carlot than for cargo carriers. Substantial economies in rail transportation costs appear possible in operation of freight station facilities and in assemblage operations.

Rail overhead expenditure for executive direction, sales promotion, and insurance are relatively lower than comparable expenses of the other types of carriers, while rail tax expenses are relatively higher.

Economy in rail yard service has been sacrificed to attain economy in road movement by heavy train loading, with the result that yard costs are greater than road costs. The terminal cost of rail and water carlot carriers far exceeds that of other carriers and is about twice the cost of highway service.

Due largely to intermediate yardings and to the distribution of freight from terminal centres by way of trains, rail line costs are relatively higher than the costs of comparable services of all other transport media, except highways.

It appears that rail transport can be improved and its cost reduced by motorizing many collection and delivery services, establishing cargo (train load) service, and, in the case of many distributive operations, by substituting small-powered light trains of a few cars for conventional trains of cargo type but of carlot consist.

The present policy of wide-open routing leads to preferential treatment of shippers, undue prolixity and complexity in tariffs, circuitous routing, unnecessary interchanges, excessive terminal delays and thereby burdens industry, as well as the carriers, with avoidable waste.

Coordination seeks, by a speedy, complete, convenient carrier service at simple, cheap but profitable rates, to develop the nation's transport adequately to fulfill every need of industry, promote trade and commerce among its citizens, develop markets of production and distribution, and stabilize the industry to the end that labor and capital employed therein shall be well compensated and made secure. To attain these objectives, it proposes to eliminate evil competition, to fuse common facilities of whatever kind into a single transport system, and to integrate joint functions into common agencies.

Integration of commerce, territory, and industry makes necessary a parallel integration in joint carrier agencies of the common functions of pricing, through scheduling, redundant service, routing, marketing, and research.

Each form of transport is superior to each other form in some important respects, and inferior in others. All should be integrated by joint rates, interchangeable equipment, and common facilities, under a programme designed to use each form in the field of its greatest utility.

Wherever necessary for serviceable, efficient, or economical operations, all carrier equipment, terminals, and facilities should be used jointly and interchangeably by carriers of all types, under appropriate and fair user arrangements.

The suggested plan of coordination will promote public welfare and at the same time protect and conserve the interests of owners and employees of the transportation industry.

Eastman Report Suggesting Legislation. Legislation subjecting highway and waterway carriers to regulations similar to that now enforced on the railways was suggested by the Federal Coordinator in a report sent to the Interstate Commerce Commission. The Commission, in sending the report on its way toward Congress, in the letter of transmittal dated Jan 23, 1935, said: "The bills for the regulation of water and motor carriers we regard as vital. Upon their early enactment depends the preservation and development of a healthy, adequate coordinated system of transport for the nation. We can have such a transport system only by unified regulation of these important competing agencies."

This report, while made public before the one on Freight Traffic, can be understood only when taken in connection with the later report. Besides suggesting this legislation, this report gives three plans which may be followed in the future development of the transportation system of the United States.

Plan I. This would put all transport agencies under the Interstate Commerce Commission acting through a coordinator. Provision to be made for supernannuated employees of railways. Improvement to be made in the reorganization and bankruptcy proceedings of railways. Improvement to be made in the labor conditions of agencies other than railways. Plan I would have to be carried out voluntarily under private management and by the use of private credit.

Plan II. This would provide for a corporation that

would acquire all railways and other transport agencies through the exchange of government-guaranteed debentures, having a sinking fund, for outstanding securities. The stock of the corporation would be owned by the government. Preferred stock and income bonds would be sold to private individuals. Direction would rest with five trustees, three appointed by the President and two elected by the holders of preferred stock and income bonds. These trustees would have salaries of the same amount as those of members of the Supreme Court. They would work under a declaration of trust to manage the properties in the public interest and to earn interest on the income bonds, dividends on the preferred stock besides fixed charges (interest on the debentures). There would be an advisory council of 24 unpaid men selected by business, labor, and agriculture. Their advice would be made public.

Plan III. This would be government ownership and operation. The railways would be taken over by the government as they were during the war. The President would appoint five trustees who would select a director general.

In Mr. Eastman's opinion, Plan I would work in the unlikely event of whole-hearted cooperation on the part of those in control of railways. If Plan I fails he thought Plan III would be adopted, seeing little sentiment in favor of Plan II.

Expenditures. There was a drastic curtailment of upkeep expenditures on railway properties from 1930 to 1933 with a somewhat larger expenditure in 1934 as compared with 1933, and in July, 1935, considerably greater amounts were spent for maintenance as compared with July, 1934. Railway officers could and did take steps to correct the trend of property repair and replacement but railway credit was not in their control.

In July, 1935, \$38,028,346 was spent for repair and replacement of railway track and buildings as compared with \$34,356,187 spent in July, 1934. These figures were reported to the Interstate Commerce Commission under oath and were exactly comparable except that the mileage reporting in 1935 was 237,700 and that reporting in 1934 was 239,002, so the spread was slightly greater than was indicated by difference in number of dollars.

An idea of the condition of railway property in 1935 may be had from a comparison of the expenditures on upkeep since 1925. In 1926 the Class I railways spent, in round numbers, \$2,130,000,000 for repairs and replacements of track, buildings, and rolling stock. At that rate they should have spent \$10,650,000,000 in the five years 1930 to 1934 inclusive. Actually, they spent \$5,957,000,000. There was at the beginning of 1935 deferred maintenance, on the basis of 1926 expenditures, of \$4,693,000,000. In 1935, the railways spent \$1,071,000,000.

There were many indications that private banking capital would be reluctant to finance this huge amount of deferred maintenance. Government financing of that as well as betterment of the railways is an alternative.

A start in rehabilitation work was made prior to 1935 through loans for the repair or replacement of cars and locomotives. Total loans to railway companies from the Reconstruction Finance Corporation (a U.S. government agency) amounted on Nov. 30, 1935, to \$487,123,572, of which \$74,327,446 had been repaid.

Rehabilitation work does not appeal to the imagination as strongly as new construction. Public aid for new construction, therefore, was forthcoming before loans for rehabilitation. Railway men themselves saw the need for a higher standard of maintenance as their limited higher expenditures in 1935 show, but it was in loans for new construction that government aid, local or national, manifested itself.

Electrification of the Pennsylvania Railroad between New York and Washington, D. C., had been made possible through loans from the national gov-

ernment. The work was nearing completion in 1935.

Miscellaneous. Erie Loan Extended. In October, 1935, the Interstate Commerce Commission approved the extension for three years of a loan of \$12,110,310 which the Erie Railroad had obtained from the Reconstruction Finance Corporation.

Denver and Rio Grande Western Reorganization. In October, 1935, the Denver and Rio Grande Western made application under section 77 of the Federal Bankruptcy Act to reorganize.

Other Railroads. The year 1935 was one of cleaning up financially for the railways—the top heavy Van Sweringen holding company device discredited, the Minneapolis and St. Louis made use of jointly, the New York, New Haven, and Hartford giving up the boot strap method of lifting itself out of its difficulties, the Denver and Rio Grande, which the Goulds had used as a base on which to build a transcontinental railway system, making efforts to straighten out its own affairs, the Erie, a sound transportation property, carried along by the government.

On the technical side the developments of the year were towards replacement of the steam locomotive by some other form of traction. Beginning electric operation of the Pennsylvania New York to Washington line, a 9-car train, consisting of a streamlined, 4800-h.p. electric locomotive, 1 passenger baggage car, 2 passenger cars, 1 Pullman compartment car, 3 parlor cars, 1 dining car, and 1 observation car, was run from Washington to Philadelphia and return on Jan. 28, 1935, making an average speed for the entire trip of 74 miles an hour.

The Union Pacific began a passenger service between Portland, Ore., and Chicago, with a 7-car articulated train hauled by a 1200 h.p. Diesel-electric locomotive. There were 12 stops in a run of 2274 miles, the average speed being 57.1 m.p.h.

The reduction of weight of passenger trains would have increased relatively the factor of air resistance, but this was just about offset by the streamline design of cars and locomotive.

Alloys of steel were used to reduce the non-revenue weight of freight cars. The Chesapeake and Ohio Railway put in service a hopper car, the capacity of which was 134,400 lb., and the weight of the empty car was 34,600 lb., increasing the ratio of revenue load weight to gross weight from 75 per cent to 79.5 per cent. The cars were built of Cor-ten steel.

The Pullman Company, using Cor-ten steel, built a standard box car, reducing the weight of the car by 5 tons.

New York, New Haven, and Hartford Troubles. In the New Haven situation, many of the factors of the general railway problem are intensified. At a time when trolley and water transport competition was making the operation of the steam railway unprofitable, the late J. P. Morgan, father of the present head of J. P. Morgan and Co., instructed C. S. Mellen, then President of the road, to buy up competing trolley and water lines. Even if this had been legal it did not prove profitable. Then E. J. Pierson became President of the New Haven. He built two large railway yards, one at the east end of the system, the other at the west end. Operation of the railway was carried on profitably. Then bus and private automobile competition proved too great. In 1935 the New Haven applied to the Reconstruction Finance Corporation for a loan of \$5,000,000, but the Interstate Commerce Commission, having the duty of passing on

the loan, disapproved of it. The New York, New Haven, and Hartford applied under section 77 of the Bankruptcy Act to reorganize without receivership. On October 31 the railway company was ordered by the United States District Court at New Haven to withhold interest on underlying bonds, but the court authorized the payment of what amounts to interest on certain equipment trusts.

Pensions. On August 19, a new pension tax bill was passed by Congress which was thought to meet the objections that the courts had found to the former pension tax bill. The new bill provided for a tax of 7 per cent on railway pay rolls, 3½ per cent to be paid by the employers and the other 3½ per cent to be paid by the employees. The bill provided for retirement at the age of 65 or after 30 years' service. The maximum pension is \$120 a month.

Railway-Owned Busses. The Southern Pacific has two rail routes from Los Angeles, Calif., to San Francisco, one following the coast and one through the San Joaquin Valley. In 1935 the Pacific Greyhound lines, allied with the Southern Pacific, put into service sleeper coaches having accommodations for 25 passengers, making the run from Los Angeles to Kansas City in 52 hours. The fare is \$24, and \$5 is charged for a single lower berth and \$7 for a double lower.

Wages. There have been no reduction in railway wage scales since 1934. By the beginning of 1935, cuts in railway labor pay had been completely restored. In the first four months of 1935 there were about 40,000 less men employed on railways than in the first four months of 1934.

Revenue and Expenses. The income account for class I railways in 1935 as compared with 1934 was

	1935 (in millions)	1934 (in millions)
Total operating revenues . . .	\$3,440	\$3,272
Total operating expenses . . .	2,575	2,442
Taxes . . .	238	240
Net railway income . . .	500	460
Deficit after fixed charges . . .	15	17

The breakup of revenue and expenses follows.

	1935 (in millions)	1934 (in millions)
Freight revenue . . .	\$2,780	\$2,634
Passenger revenue . . .	355	346
Mail revenue . . .	92	91
Express revenue . . .	53	54
All other . . .	160	147
Total . . .	\$3,440	\$3,272
Maintenance of way expenses . . .	\$ 399	\$ 365
Maintenance of equipment . . .	672	628
Traffic expenses . . .	93	89
Transportation expenses . . .	1,241	1,164
General and other expenses . . .	170	186
Total expenses . . .	\$2,575	\$2,442

Railway Built and Abandoned. There were 45 miles of new first track, 12 miles of new second track, and 1 mile of new third track built in the United States in 1935. This compares with 76 miles of first track built in 1934 and with 6026 miles of new first track built in 1902, the year in which the greatest number of miles was built according to the records of the *Railway Age*. The railway mileage abandoned in 1935 was 1843, comparing with 1995 in 1934, the year in which the greatest number of miles were abandoned according to statistical records of the *Railway Age*. The only State in which as much as ten miles of

new railway line was built in 1935 was Utah where the Union Pacific built 10.79 miles from Iron Springs to Iron Mountain on its Salt Lake-Los Angeles line.

Locomotives Ordered. There were 125 locomotives ordered from United States builders in 1935, 83 for service in the United States, 27 for service in Canada, and 15 for export to other countries. This compares with 200 ordered in 1934 of which none were for service in Canada but 17 were for export to other countries.

Locomotives Built. There were 201 locomotives built in the United States in 1935 of which 184 were for domestic service and 17 were for foreign service. This compares with 110 built in 1934 of which 91 were for domestic service and 19 for foreign service.

Freight Cars Ordered. In 1935 there were 21,230 freight cars ordered from builders in the United States. Of these 18,699 were for domestic use, 2421 were for use in Canada, and 110 were for export. This compares with 25,946 ordered in 1934 of which 24,611 were for domestic use, 1323 were for use in Canada, and 12 were for export. There were 7821 cars built in the United States in 1935 and 25,327 built in 1934.

Passenger Cars Ordered. In 1935 there were 79 passenger cars ordered from United States builders of which 63 were for domestic use and 16 for use in Canada with none for export. This compares with 403 ordered in 1934, none of which was for use in Canada and 15 of which were for export.

There were 179 passenger cars built in the United States in 1935 all of which were for domestic service. In 1934 there were 283 built of which 268 were for domestic service and 15 for foreign service.

Equipment Prices. Prices derived from reports of the Interstate Commerce Commission may not be strictly comparable because details are not obtainable but are given for what they are worth. In 1935 a passenger locomotive weighing 475,000 lb. was bought for \$120,898 and in 1934 a passenger locomotive weighing 477,400 lb. was bought for \$122,000. In 1935 a 40-ton steel box car was bought for \$2135 and in 1934 a 50-ton steel box car was bought for \$2411. In 1935 a streamlined Diesel-electric five-car train cost \$423,085.

New Financing. The total face value of new securities of railways sold to the public in 1935 was \$144,028,000. In 1934 the total was \$243,142,000. None of the offerings to the public in 1935 was made by J. P. Morgan because that firm, heretofore looked upon as the outstanding railway bankers of the world, had withdrawn from the underwriting business.

The largest railway issue in 1935 was that of the Pennsylvania Company, an issue of \$50,000,000 4 per cent bonds due in 1963 and secured by Norfolk and Western Railway stock. The bonds were sold to Kuhn, Loeb and Company at 97½ by the railway company and offered to the public by the bankers at 100. An issue of \$16,000,000 4 per cent bonds of the Chicago Union Station was sold by the Station Company to Kuhn, Loeb and Company at 98½ and offered to the public by the bankers at 101. The bonds are due in 1963. The New York Central, its bankers heretofore being J. P. Morgan, sold an issue of Toledo and Ohio Central, guaranteed by the New York Central, 3¾ per cent bonds due in 1960. The amount of the issue was \$12,500,000 and the price paid the railway com-

pany by the bankers was 97, the offering price to the public was 99. The Bankers in this case were the First Boston Corporation. An issue of \$12,000,000 5 per cent bonds due in 1945 of the Atlantic Coast Line railway (bankers heretofore J. P. Morgan) was bought from the railway company for 97 and offered to the public at 100 by Brown, Harriman and Company.

Refunding. The Great Northern Railroad had an issue of \$100,000,000 7 per cent bonds falling due in the latter part of 1935. Private bankers had offered to underwrite the refunding of these bonds with an issue of 5 per cent bonds for a commission of about \$1,000,000. The Reconstruction Finance Corporation, a government agency, underwrote the sale of \$1,000,000 4 per cent bonds at par without commission. Indications were that the offering would be a success. This is of the greatest importance because, heretofore the periodically recurring necessity for refinancing was the strangle hold which an individual banking firm had on a railway company.

Receiverships and Foreclosure Sales. There were in all 16 railway companies placed in the hands of receivers or trustees in 1935. Three of these were subsidiaries of the St. Louis Southwestern. The total mileage of all of the roads was 29,018. The total funded debt outstanding was \$1,281,864,412. The total stock outstanding was \$901,114,755. Legally there is a difference between placing a railway in the hands of a receiver and in the hands of a trustee. In both cases a need for reorganization is acknowledged but with a receivership bankruptcy is an established fact. The establishment of this fact is not necessary. Comparing receiverships only the records of the *Railway Age* show 10 railways with a total mileage of 3953 placed in receivers' hands in 1935 and eight with a mileage of 744 placed in receivership in 1934. The larger railways that were placed in the hands of receivers or trustees during the year 1935 were: the Chicago and North Western, 8428 miles, the Chicago, Milwaukee, St. Paul, and Pacific, 11,123 miles; the New York, New Haven, and Hartford, 2073 miles; the Denver and Rio Grande Western, 2584 miles; the Western Pacific, 1213 miles; and the St. Louis and Southwestern, which with its three subsidiaries has a mileage of 1780.

The receivership of the Chicago and North Western is especially noteworthy because it is a conservatively capitalized railway company. The development of the property has been conservative and, heretofore, its geographical position has been considered most favorable. Its main line connects the eastern end of the Union Pacific with Chicago. It has a network of lines in Wisconsin, Iowa, and South Dakota. Neither busses nor aeroplanes have cut drastically into its business. Grain and livestock furnish a large part of its freight business. While the country that it serves and the country west of the Missouri River were being developed it had a westbound freight haul of settlers' goods which were required for the establishment of homes. Even if grain and livestock had continued to move east in increasing volume there would have been scant loading for westbound cars after new settlement had ceased. Only a few years ago Chicago and North Western bonds were considered a very conservative investment for sav- ings banks.

There were only five small railways sold at foreclosure in 1935. It denotes the same thing to say that there were only 437 miles of railway

bought at foreclosure in 1935 but it connotes the situation more correctly.

Dividend Changes. The Pittsburgh and Lake Erie, controlled by the New York Central, paid \$1 extra on the common stock in addition to the regular \$2.50 paid annually on that stock. The Alabama Great Southern, controlled by the Southern Railway, omitted the \$2 dividend usually paid in December. The Wheeling and Lake Erie made a payment of \$8.75 towards cumulated back dividends on its prior lien stock on which the arrears had amounted to \$43.75.

Rates. The Interstate Commerce Commission allowed a temporary increase in certain freight rates, the increase to expire on June 30, 1936.

RANDOLPH-MACON WOMAN'S COLLEGE. An institution for the higher education of women in Lynchburg, Va., under the auspices of the Methodist Episcopal Church, South, founded in 1893. The enrollment for the autumn of 1935 was 631. The faculty numbered 60. The endowment amounted to \$1,203,630, while the income for the year was \$407,762. The library contains 43,003 volumes; 191 current periodicals, a browsing room of 1300 volumes, the gift of the Carnegie Corporation; and a rare book room. President, Theodore H. Jack, Ph.D.

RAPID TRANSIT. As has been previously noted, subway construction is confined to our largest cities where traffic volumes and surface congestion force recourse to costly underground work for rapid transit. We have been through a great era of subway building in New York, and it seems probable that, for some years to come, there will only be scattered and, compared with these recent works, small scale constructions. It has been reported that San Francisco is seeking Federal aid for the construction of the first subway transit system in that city. Tentative plans, estimated to cost 50 million dollars, have been prepared.

In New York one link of the Municipal System, built a few years ago, was not completed. Construction of the so-called Sixth Avenue subway was postponed until the completion of the new water supply distribution Tunnel No. 2 because this subway followed the line of Tunnel No. 1, which furnished the only means of distributing the Catskill supply to lower Manhattan, Brooklyn, and Staten Island. Tunnel No. 2 has now been finished and bids have been taken for the Sixth Avenue construction.

RAYON. According to the annual statistical survey of the rayon industry by *Rayon Organon*, the world production for 1935 was estimated at about 950,000,000 lb. as compared with 775,000,000 lb. in 1934. The estimate is based on the known production of Japan and of the United States for the year and upon partial returns from the other leading producing nations, which indicate that the total for the year was about 22 per cent greater than in 1934. Japanese production increased 40 per cent, rising from 153,000,000 lb. in 1934 to 215,000,000 lb. in 1935.

In the United States rayon production increased 23 per cent over 1934, with a total of 256,659,000 lb. as compared with 208,496,000 lb. in 1934. Domestic consumption reached a new high figure of 251,722,000 lb. compared with 194,808,000 lb. in 1934. During the calendar year 1935 the United States exported 2,187,192 lb. of rayon yarn, valued at \$1,158,604. Total exports in 1934 amounted to 2,509,067 lb. valued at \$1,322,595. Imports of rayon yarn to Dec. 31, 1935, totaled 25,815 lb. valued at

\$25,623, a further decline in imports which had reached a peak of more than 15,000,000 lb. in 1929.

READING, rēd'ing, RUFUS DANIEL ISAACS, FIRST MARQUIS OF. A British statesman, died in London, Dec. 30, 1935, where he was born, Oct. 10, 1860. Educated at University College School and in Hanover and Brussels, as a boy he went to sea as a "ship's boy" on a tramp steamer, but later began a city career as a jobber on the Stock Exchange. His firm failing, young Isaacs decided to embrace the law and at the age of 24 entered the Middle Temple. He was called to the bar in 1887, and his experience in the city proved beneficial, being the cause of his retention in many financial cases. He became a queen's counsel in 1898. He began his parliamentary career in 1904 as a Liberal member for Reading, holding his seat until 1913. During the years 1905-10, he advanced steadily in his profession, becoming known as an eminently fair attorney with great ability as a cross-examiner, but his success in the Courts was not repeated in the House.

In 1910 he became Solicitor-General and soon succeeded to the Attorney-Generalship. Also in that year he was knighted. In June, 1912, Asquith made him a member of his cabinet, an honor which no attorney general had ever before received. Like Chancellor Lloyd-George, he was accused of speculation in Marconi stocks, admitted the charge, and seemed to lose nothing in political prestige.

Succeeding Lord Alverstone as Lord Chief Justice in 1913, in the following January he was made baron, taking the name Lord Reading. His dignity, courtesy, and carefully delivered judgments were the highlights of his judgeship. His ability and experience in financial matters led to his being enlisted by the Chancellor of the Exchequer for aid in the financial crisis of 1914. In the following year he was made Knight Grand Cross of the Bath, and in the autumn was appointed a member of the Anglo-French Loan Mission to America, which proved the turning point of his career.

So successful was he in his conduct of the affairs of the mission, that in 1917 he was appointed Special Envoy to America, and in 1918, on the death of the British Ambassador, he was made High Commissioner and Special Ambassador, while still retaining the office of Lord Chief Justice. In the meantime, he had been raised in the peerage, becoming a viscount in 1916 and an earl in 1917. In 1919 he returned to England.

Three years later, the Earl was appointed Viceroy of India, an appointment that was met with some dissatisfaction, for India at that time was seething with unrest. Reading's policy was one of patience and conciliation as well as persistence and firmness, and his tact and justice won him the respect of all classes. He consulted with M. Gandhi, and although the Home Government was desirous of Gandhi's arrest, Reading felt it would be unwise to make a martyr of him, especially when his popularity was so great. The threat of resignation by two of the more important Governors, however, led him to alter his plans. During his first year in office the country was visited by the Prince of Wales, and in certain sections hostile demonstrations took place. During his régime, the financial condition of the country improved, due in part to the Viceroy's experience and also to bumper crop production, and at the expiration of his term in March, 1926, he was made a Marquis and returned to England,

where he was given the Freedom of the City of London in June.

In 1927, he became chairman of the United Newspapers, Ltd., the publishers of a group of Liberal papers, and gradually took up various business activities. He was a member of the Indian Round Table Conference in 1931, and of the joint Select Committee, which in 1933-34 laid down the principles that were followed by the Government of India Act in 1935. In August, 1931, on the fall of the Labor Government, he was appointed a Secretary of State for Foreign Affairs in the National Cabinet of Ten formed to pass a supplementary budget, but it dissolved after the abandonment of the gold standard. From 1926 to 1934 he was captain of Deal Castle, and from 1934, Lord Warden of the Cinque Ports. In 1933 he resigned the presidency of the Anglo-German Association, which he had held since 1929, because of the treatment accorded to Jews in Germany.

RECLAMATION. Irrigation projects in the United States, other than those involved in such constructions as the Boulder Dam and as may ultimately develop from the Grand Coulee and other works, appear to be at a standstill. This situation seems reasonable when we recall that through the AAA and similar agencies, the Government is now attempting not to develop new areas but to curb agricultural production and reduce crop acreage. In fact, with these points in mind, it becomes increasingly difficult to justify the whole reclamation policy of the Federal Government. It seems to have been foolish for the Reclamation Bureau to build works to bring new areas under cultivation and thus contribute to the evils of agricultural overproduction.

The Bureau of Reclamation came into action (1902) after the best and most economically favorable areas had already been developed by private or district organizations. Even today its works serve but 7.6 per cent of the irrigated lands of the United States. Furthermore, it undertook to add to the cultivated lands of the country at a time when the area of such lands was already close to the limit which could be profitably operated. From the economic standpoint, it thus started with handicaps impossible to overcome and, judged by tangible economic values, it has been an economic failure. While the Bureau has built some magnificent works and has improved the standards of irrigation practice, it has, because of these handicaps, failed to demonstrate that the Federal Government can develop the public lands on a sound economic basis. It seems probable that no reclamation through irrigation on a large scale will be undertaken for some years to come.

On the other hand, the nation has recently become conscious of the fact that soil erosion has been, in some cases rapidly, destroying the land values in many areas. The western dust storms plus continuous propaganda have suddenly brought this new problem of conservation to the fore. The present programme of the Federal Government calls for an expenditure of half a billion dollars in soil protection works. This sum exceeds the entire expenditure of the Reclamation Bureau yet we are, apparently, to undertake, with comparatively little knowledge of the problem or of its importance, another gigantic spending policy which, to many engineers, appears to be simply another means of disposing of relief funds. Normal prudence and care would suggest undertaking work in a totally new field on a programme of progressive

study and expenditure rather than through a sudden stupendous venture into the unknown.

RED CROSS, THE AMERICAN NATIONAL. A semi-governmental organization, chartered by Congress in 1905 to furnish volunteer aid to the sick and wounded of armies in time of war and to continue and carry on a system of national and international relief in time of peace, the same being applied in mitigating the sufferings caused by pestilence, famine, fire, floods, and other great national calamities.

Aiding more than one half million victims of 160 different disasters during 1934-35, the Red Cross answered more calls for help in the United States and its insular possessions than during any other 12 month period in its history. One hundred twenty-eight of these disasters affected 37 States and the territory of Alaska, establishing a new record for frequency which is 50 per cent higher than the average for the past 10 years. During one summer week of 1935 the Red Cross was simultaneously bringing relief to 38 disaster stricken communities in 15 States.

A total of 20 Disaster Institutes were held at strategic points, following out the disaster preparedness programme inaugurated the preceding year. They brought together chairmen and members of disaster committees, community leaders, city and state officials, and representatives of police, fire, and health departments. In addition, the subject of Disaster Preparedness and Relief was presented at 22 Red Cross Chapter Institutes, attended by chapter officers and workers.

Also notable during the past fiscal year has been the cooperation of Red Cross First Aid Service with the Civilian Conservation Corps in training selected men from CCC camps in first aid, of whom more than 64,000 received certificates. A similar plan was initiated for the training of selected men from these camps in Life Saving and water safety methods during the summer months.

Altogether First Aid certificates were awarded to 187,255 persons completing the course, and Life Saving certificates were awarded 74,274. The millionth First Aid certificate to be awarded since the inception of this Red Cross service 25 years ago was presented by Chairman Cary T. Grayson in November.

In the fiscal year ending June 30, 1935, chapters reported aid given to 223,042 civilian families. Co-operating with the Federal Emergency Relief Administration many Chapters continued to aid transient veterans, and assisted the FEERA's adult education programme for the unemployed through the use of unemployed teachers, organizing classes in the various Red Cross Services.

The Red Cross, through its local Chapters, assisted 286,984 ex-service men and service men or families; and 59,756 ex-service and 27,379 service men or families were aided by National workers in army posts and government hospitals. The nurses' reserve closed the fiscal year with 35,703 on the active list and Red Cross Public Health nurses made 1,156,003 nursing visits and inspected 633,944 children in schools. At the close of the year, 766 Public Health nurses were employed by 434 Chapters. Home Hygiene instruction was given to 68,555 persons.

Special services performed by volunteers, backbone of the Red Cross, included 1,252,333 garments produced by Chapter volunteers; 320,406 pages of braille made by hand and 344,811 by the duplicating process. Motor Corps, Canteen and many other volunteer activities continued to meet all needs. The

number of enrolled volunteers, excluding those engaged in disaster relief, stands at 135,026.

The organization's senior membership totaled 3,837,941 for the year ended June 30, 1935, and the Junior Red Cross membership during the school year was 7,752,243. Both memberships showed an increase over the previous fiscal year.

The President of the United States is president of the Red Cross, which is governed by a board of 18, of whom six are appointed by the President. Adm. Cary T. Grayson, appointed Feb. 8, 1935, by President Roosevelt to succeed the late John Barton Payne, is active head of the organization and Chairman of the Board, and James L. Fieser and James K. McClintock are vice-chairmen. The National Red Cross, with branch offices in St. Louis and San Francisco, directs the relief activities of 3711 Chapters and 9112 Branches active in practically every county in America.

REED COLLEGE. A nonsectarian, coeducational college of liberal arts and sciences in Portland, Oregon, founded in 1911. The enrollment for the autumn of 1935 is as follows: men, 266; women, 182, total, 448. Faculty, 35. A Director of Admissions was appointed in September, 1934. The productive endowment funds for 1934-35 amounted to \$1,826,281.67, and the total income for 1934-35 (exclusive of gifts) was \$148,651.46. The college operating budget for 1934-35, \$154,500. The library contains approximately 52,000 volumes. An unusual event was the Inaugural Education Conference held May 15 to 18, 1935, to discuss the educational problems of Reed College with the aid of nationally known experts, in lieu of the usual type of Inaugural for Pres. Dexter M. Keezer. Dr. Keezer became President of Reed College in September, 1934. In July, 1935, the first meeting in this country of an American-Japan Student Conference was held on the Reed campus, with 50 Japanese college and university students in attendance, and about 100 American students from Pacific Coast educational institutions.

REFERENDUM. United States. While 1935 was what is called an "off year" in that fewer elections were held than in even years, the volume and importance of popular legislation were considerable. The Federal government continued its new policy of taking the census of the aboriginal population relative to the "Indian Bill of Rights" (see *NEW INTERNATIONAL YEAR BOOK* for 1934, p. 616). Zuni, N. M., the largest, if not the oldest, Amerind *pueblo* in the United States, approved the bill by an overwhelming vote and on January 12, its first popularly chosen governor, lieutenant governor, and councilmen were installed—the first named receiving the insignia of authority in the form of a cane presented by President Lincoln in 1865 and thence handed down.

All five Iroquois reservations in New York State, the Alleghenies, Tonawandas, Tuscaroras, and Cattaraugus Senecas, decisively rejected the act—the last named by a vote of 475 to 101—because of alleged fear that it would invite white interference. A majority of the enrolled St. Regis Mohawks failed to register a preference and were counted as favorable, although the vote actually cast was adverse. The Flatheads of Montana ratified the act and availed themselves of their privilege to incorporate and adopt a constitution. The latter was formally presented to the hereditary chiefs of the tribe by the U.S. Secretary of the Interior Harold L. Ickes in Washington and is the first of its kind.

Referenda were also taken among the nation's

farmers. On May 25 they voted on the question of continuing wheat control and, according to the official returns, the vote in favor was 379,840 with 61,133 against. On October 26, a vote was taken on the "corn-hog adjustment programme," which resulted in 556,815 being recorded in favor of continuing and 90,227 against. See *Agriculture under Agricultural Adjustment*.

Alabama. On February 26, the proposed repeal of prohibition was defeated by a majority of about 5000 in spite of a contrary majority of over 22,000 in the three large industrial counties. Of the 67 counties, however, 49 voted against repeal.

Arizona. The vote on the "corn-hog programme" was 51 in favor and 40 against.

Arkansas. For the "corn-hog programme" there were 4570; against, 602. Two western townships voted "dry" by large majorities.

California. For the "corn-hog programme" there were 1774; against, 196. In Sacramento, bond issues aggregating \$591,000 were approved; others to the extent of \$374,000 were rejected. In Beverly Hills, \$400,000 were voted for schools.

Colorado. For the "corn-hog programme" there were 1150; against, 145.

Connecticut. For the "corn-hog programme" there were 26; against, 2.

Delaware. For the "corn-hog programme," 757; against, 166.

District of Columbia. In view of last year's decision (*NEW INTERNATIONAL YEAR BOOK* for 1934, p. 616) that the District Commissioners had no power to take an "advisory referendum," one of them prepared a bill, for presentation to Congress, to confer such power.

Georgia. On May 15 the proposal to repeal the prohibition law was defeated by a vote of, approximately, 82,120 as against 81,893. A separate proposal to authorize beer sales received 85,402 as against 76,514; another, authorizing wine sales, received 83,847 against 75,245. For the "corn-hog programme," there were 321 votes; against, 16.

Idaho. For the "corn-hog programme," there were 1593 votes; against, 167.

Illinois. The "corn-hog programme" received 54,376 votes; against, 7448.

Indiana. In *re Todd*, (Ind.) 193 N.E. 865, upholds, as part of the State constitution, a proposal which on November, 1932, received 439,949 votes as against 236,613; although votes for candidates at the same election aggregated 1,576,897 and article 16 of the constitution required "a majority of the electors" to ratify an amendment. Overruling three previous decisions, the Indiana Supreme Court construed that requirement as meaning a majority of those voting on the proposal. While there was a vigorous dissenting opinion by Chief Justice Fansler, and while the decision was criticized by the Dean of the John Marshall Law School, the friends of popular legislation regarded it as a victory for their cause since it insured an expression from those electors who were actually interested in a proposed measure, and obviated inaction because of the indifferent voter.

Iowa. For "corn-hog programme," 153,343; against, 24,681.

Kansas. For "corn-hog programme," 30,742; against, 5559.

Kentucky. On November 5 two amendments of a constitution which had not been changed for 15 years were adopted. One provided for old age pensions and it was adopted by almost a 10 to 1 vote; the other repealed the prohibition amendment and was ratified by a smaller majority.

Maryland. The vote for the "corn-hog programme," was 1559; against, 149. The legislature enacted laws authorizing local referenda and Colman Manor submitted proposals for a fire protection tax and for street improvement bonds up to 8 per cent of the town's assessed value.

Michigan. For the "corn-hog programme," there were 2586 votes; opposed, 88.

Minnesota. For the "corn-hog programme," 33,387; against, 4446.

Mississippi. On December 2, the city of Oxford, which owns a light and power plant, voted 290 to 237 against entering into a TVA contract. Two counties of the State voted to prohibit the sale of beer.

Missouri. The vote for the "corn-hog programme" was 33,718; against, 4731.

Montana. The vote for the "corn-hog programme" was 1408; against, 78.

Nebraska. The vote for the "corn-hog programme" was 52,719; against, 6984. A proposed bond issue of \$775,000 for schools was rejected in Lincoln. Citizens of Creighton voted in favor of liquor sales by the drink.

Nevada. The vote for the "corn-hog programme" was 216; against, 21.

New Jersey. The vote for the "corn-hog programme" was 176; against, 13. The act of 1933 providing for municipal referenda on Sunday amusements, was availed of by several municipalities. On November 5 the Camden electors voted, under the act of 1917, in favor (22,009 to 4389) of a municipal power plant. A previous vote to the same effect was set aside by the State Supreme Court in *Public Service, etc. Co. v. Camden*, (N. J.) 180 Atl. 778, on the ground that the petition therefor failed to contain 20 per cent of the registered electorate as required by the statute.

New Mexico. The vote for the "corn-hog programme" was 180; against, 24. On September 17, the electors voted on five proposed amendments to the State constitution. One of these exempted from taxation homesteads up to \$2500 in valuation.

New York. The proposal to authorize initiation of constitutional amendments by 10 per cent of the number voting on the governorship at the preceding election, was approved by the State senate on April 4 but failed to pass in the assembly. On April 23, Governor Lehman signed a bill authorizing municipal referenda on Sunday theatres. On June 11, Beacon, by a vote of 1273 to 4888, and for the second time, rejected the city manager plan. Four notable proposals were approved by the voters on November 5: (1) Directing the legislature to provide alternative forms of local government at the option of the counties, and authorizing the New York City municipal assembly to abolish unnecessary county offices. Under this, Monroe County, containing Rochester, has already adopted the county manager plan by a vote of 45,513 to 28,863; (2) Authorizing verdicts by five-sixths of the jury in civil cases (See the article on LAW under *Juries*); (3) Repealing the double liability for bank stockholders; (4) A \$55,000,000 bond issue for unemployment relief. The Albany project for a municipal power plant was adopted on November 5 by 22,272 to 8930; a similar proposal in Lockport was rejected by about 1000.

North Carolina. The city manager plan was defeated in Raleigh on March 12 by less than 300 votes and the result was ascribed to the wholesale manipulation of Negroes by white politicians. At

the ensuing municipal primary on April 22, Negro leaders, including the Rev. George Fisher, challenged hundreds of these exploited Negroes and prevented them from voting.

North Dakota. The vote for the "corn-hog programme" was 26,399; against, 4722. A referendum on the sales tax law, July 15, resulted in its approval by a vote of 75,166 to 65,890.

Ohio. In *State ex rel. Singer v. Cartledge*, 129 O.St. 279, a majority of the court upheld the Steubenville city council in raising municipal salaries which had been fixed by a popular vote. On May 28 the proposed repeal of Toledo's city manager charter, adopted in 1934, was defeated by a vote of 27,478 to 18,488. Nine proposed bond issues were defeated there on November 5, as was a majority of similar proposed issues elsewhere in the State though they were to have been supplemented by Federal grants. But of proposed increased levies in school districts and other local subdivisions, the trend was toward approval. In Carrollton, home of F. Scott McBride, Anti-Saloon League leader, the vote was in favor of prohibiting hard liquor sale but permitting that of 3.2 per cent beer. Vote on the "corn-hog programme" was 26,426; against, 4669.

Oklahoma. Vote for the "corn-hog programme" was 20,319; against, 3277.

Oregon. Vote for the "corn-hog programme" was 1652; against, 239.

Pennsylvania. On September 17, the proposal for a convention to revise the State constitution was rejected by a majority approximating 250,000. Vote for the "corn-hog programme" was 1231; against, 265. At the general election of November 5, some 5,000,000 voters, in 276 municipalities, participated in plebiscites on the licensing of Sunday amusements. The larger cities generally voted in favor—Philadelphia by about 5 to 2; but many others, including Harrisburg and Gettysburg, were opposed. On the liquor question, more than 116 municipalities voted to prohibit the sale of beer as against 107 in favor; 106 voted against hard liquor to 70 in favor.

Philippines. The Commonwealth Constitution, approved by the convention on February 8, was ratified by the electors on May 14, the vote being 1,213,046 in favor and 44,963 against. Under article 14 amendments must be "submitted to the people for their ratification" and "approved by a majority of the votes"; but no provision appears to be made for a new convention.

Rhode Island. Votes for the "corn-hog programme" were 12; against, 5.

Tennessee. On March 12, the proposed \$8,000,000 municipal power bond issue was approved by a decisive majority of the Chattanooga voters. A resolution for a referendum on repeal of the State prohibition law was adopted by the lower legislative branch, but failed in the senate. Votes for the "corn-hog programme" were 10,287; against, 1074.

Texas. Seven proposed amendments to the State constitution were submitted at a special election, August 24, with results as follows: (1) For old age pensions, 444,539; against, 108,565. (2) For abolishing jury trials in temporary commitment of mentally ill, 294,287; against, 199,959. (3) For state dispensary to sell intoxicants, 297,597; against, 250,948. (4) For authorizing submission of proposals at special legislative sessions, 214,024; against, 238,258. (5) For authorizing probation on suspended sentences, 245,285; against, 216,549. (6) For abolishing official fee system in

certain counties, 274,537; against, 188,672. (7) For furnishing free text books to all school pupils, 257,-815; against, 280,019.

Utah. Votes for the "corn-hog programme" were 799; against, 57.

Virginia. Votes for the "corn-hog programme" were 5342; against, 360.

Washington. Votes for the "corn-hog programme" were 1316; against, 69.

West Virginia. Votes for the "corn-hog programme" were 69; against, 10.

Wisconsin. Votes for the "corn-hog programme" were 4989; against, 452.

Wyoming. Votes for the "corn-hog programme" were 902; against 86.

See the articles on the above-mentioned States for further details.

FOREIGN

Germany. From the international standpoint the most important plebiscite of the year 1935 was that to determine the sovereignty of the Saar Valley which took place as scheduled on January 13. Sarah Wambaugh, a disinterested observer, pronounced the proceedings "orderly and carefully planned" by the Commission of the League of Nations, whose prestige was correspondingly enhanced. Safeguards in the form of neutral military contingents and inspectors, insured not only a secret, but a full and untrammelled vote. According to the Commission's Secretary, 98 per cent of the electors participated and the overwhelming majority for Germany (477,119 against 45,513 for the status quo and only 2124 for France) was everywhere accepted as the spontaneous expression of the popular will. Probably no question of European sovereignty was ever more completely so settled. See SAAR under *History*

Greece. On Nov 3, 1935, the long promised plebiscite was taken on the question of restoring the monarchy, but there were not the same safeguards as in the Saar and the proportion of eligibles who voted was far less. Indeed the Greek republicans appear generally to have abstained from voting and the nominally large majorities for restoration lack real significance. The whole situation strongly recalls the Napoleonic plebiscites of the early 19th century. See GREECE under *History*

Switzerland. On February 24, a referendum, initiated by Socialists and Communists, was taken on an act of the Swiss Parliament lengthening the term of compulsory military service. Due to an intensive campaign throughout the country, 80 per cent of the electorate participated and the total vote was 506,845 for the law and 431,902 against. In the Geneva canton, 19,742 voted for and 14,521 against. An even larger proportion (83 per cent) participated, on June 2, in a referendum on the proposed recovery plan, which had some of the features of the "New Deal" of the United States but also, its opponents charged, involved retention of the gold standard. The proposal was rejected by a vote of 566,242 to 424,878. Indeed only 4 of the 22 cantons voted in favor—they were the important ones of Basel, Berne, Schaffhausen, and Soleur. The attempted initiation of a law, to suppress Masonic (See FREEMASONRY) and other secret societies, failed for lack of sufficient genuine signatures to the petitions—15 per cent or more were found to be fraudulent.

Bibliography. Wambaugh, *Post World War Plebiscites* (1933); Lobingier, *The People's Law* (1909).

REFORMED CHURCH IN AMERICA.

Composed originally of settlers from the Netherlands, and known until 1867 as the Reformed Protestant Dutch Church in North America, the denomination has since become largely intermixed with elements from many other nationalities. Its doctrinal standards are the Belgic Confession, the Heidelberg Catechism, and the Canons of the Synod of Dort. The form of government is of the Presbyterian type.

In 1935 the denomination reported 726 churches, 866 ministers, 87,771 families, and 160,065 communicants. In the foreign mission field, which included China, India, Japan, Arabia, and Iraq, there were employed 146 missionaries. Two ordained ministers and four other workers were employed in the mission in the State of Chiapas, Mexico. There were also 200 domestic missionaries who served as pastors of mission churches and as teachers and other workers among the Indians of Nebraska, Oklahoma, and New Mexico, the mountaineers of Kentucky, and the Negroes of Alabama. Contributions reported in 1935 amounted to \$2,814,040 for congregational expenses, \$521,550 for denominational benevolence, and \$94,048 for other benevolences.

The church colleges are Hope, at Holland, Mich.; Central, at Pella, Iowa; and Northwestern Junior, at Orange City, Iowa, while theological seminaries are maintained at New Brunswick, N. J., and Holland, Mich. The official paper is the *Intelligencer Leader*, published at Holland, Mich. At the session of the general synod in 1934, the Rev John Wesselink, D.D., of St. Anne, Ill., was elected president. The usual annual session was omitted in 1935, so that Dr. Wesselink continued in office until 1936. The Rev John A. Ingham, D.D., is stated clerk of the general synod. Headquarters of the denomination are at 25 East Twenty-second Street, New York City.

REFORMED EPISCOPAL CHURCH.

A denomination formed in 1873 by Bishop George David Cummins, D.D., and associated clergymen and laymen who had withdrawn from the Protestant Episcopal Church. It is liturgical and evangelical and possesses the historic episcopate. The two synods are New York and Philadelphia, comprising churches from New York to Virginia, and Chicago (Bishop Frank V. C. Cleak, D.D., in jurisdiction), comprising those in Illinois and Ohio. At the twenty-seventh triennial session of the general council, held in Germantown, Pa., May 17, 1933, there were reported 68 parishes, served by 3 bishops and 63 other ministers, with 8470 communicants.

The Church's paper, the *Episcopal Recorder*, has been published continuously in Philadelphia for 113 years. Its theological seminary, 25 South 43d St., Philadelphia, was founded in 1886. The foreign mission field is the Lalitpur district in India, with more than 200,000 inhabitants. To the evangelistic department and the orphanage, a medical department, with hospital, was added in 1933. The home mission field, under the care of Bishop Joseph E. Kearney, D.D., consists of 36 parishes and missions among the Negroes of South Carolina. The presiding bishop and president of the general council is Bishop Robert Westly Peach, D.D.; the general secretary is the Rev. Howard D. Higgins, Th.M., and headquarters are at the seminary. The office of the mission boards is 1016 Girard Trust Building, Philadelphia.

REINDEER HUSBANDRY. See ALASKA.

RELIEF. See CHILD WELFARE; UNITED STATES under *Congress*.

RENSSELAER POLYTECHNIC INSTITUTE. A nonsectarian institution for the technical training of men in Troy, N. Y., founded in 1824. In 1935 there were 1244 students enrolled. The teaching staff numbered 130. The productive funds amounted to \$5,090,600 as general endowment; the total income was \$775,800. As gifts for endowment \$37,651 was received. The library contained 27,086 volumes and 25,281 pamphlets. The Ricketts Building for Chemical, Metallurgical, and Aeronautical Engineering was completed during 1935 at a cost of \$450,000, and the Walker Chemical Laboratory remodeled. President, William O. Hotchkiss, C.E., Ph.D.

REPARATIONS AND WAR DEBTS.

There was no change during 1935 in the status of the reparations and war debt problem as it existed in 1934 (see 1934 YEAR BOOK, p. 620). In accordance with the Lausanne agreement of July 2, 1932 (see 1932 YEAR BOOK, p. 722-723) the Hoover moratorium on German and non-German reparations and on the war debts which the various European governments owed one another was continued pending a "satisfactory settlement" of their war debt controversies with the United States.

The United States Congress and Government showed no willingness to grant the drastic reductions and adjustments in the debt funding agreements demanded by the debtor governments. As had become customary since the debtors commenced to default on their installments in 1932, the State Department at Washington in 1935 sent semi-annual notices to the respective governments stating the amount of the installments due on June 15 and December 15 and demanding payment. The notes reiterated that the American Government was ready to "discuss through diplomatic channels" any proposals which the Governments might desire to put forward in regard to the payment of their indebtedness.

With the exception of Finland, which again paid both installments in full, all of the debtor governments defaulted. The replies of the defaulting States asserted that they were unable to submit any proposals. The notes reiterated the debtor States' contention that the suspension of German reparation payments, the continuance of the world economic depression, and the high tariff policy of the United States all combined to render the resumption of war debt payments impossible. Table I shows the war debt installments due the United States from foreign countries on June 15 and Dec. 15, 1935, and the total amount in default on Dec. 15, 1935:

TABLE I—WAR DEBT INSTALLMENTS DUE U.S.

Country	Installment due June 15	Installment due Dec 15	Amount in default, Dec 15
Belgium	\$ 7,409,454	\$ 4,642,454	\$ 33,630,269
Czechoslovakia ..	1,682,813	1,682,813	9,584,150
Estonia	322,850	444,850	2,611,886
Finland	165,453	230,453
France	64,367,138	22,308,312	250,292,293
Great Britain ..	85,670,765	117,670,765	582,803,307
Hungary	37,411	50,721	290,381*
Italy	15,141,593	2,141,593	47,853,384
Latvia	134,883	185,083	961,995
Lithuania	164,352	121,467	776,320
Poland	4,019,040	5,524,040	32,535,989
Rumania	1,448,750	48,750	3,843,750
Yugoslavia	325,000	1,150,000
Total	180,909,502	155,051,301	966,828,584

* The Hungarian Government also deposited with the foreign creditors' account at the Hungarian National Bank Hungarian Treasury certificates totaling 994,995 pengos as of June 15, 1935, plus the pengo equivalent of the amount due on Dec. 15, 1935.

In addition to the amount of war debt payments in default, shown in Table I, the Greek Government was in default in the sum of \$4,426,508 as of Jan. 1, 1936, under the funding agreement of May 10, 1929. The German Government on Jan. 10, 1936, was in arrears to the amount of \$7,226,611 on interest payments. The total funded German debt to the United States for army costs and mixed claims amounted to \$1,278,340,010. Up to Jan. 10, 1936, payments of principal and interest aggregating \$33,587,810 had been received on this debt and \$1,232,250,361 was outstanding. The Austrian Government was in default in the sum of \$146,213 on Jan. 10, 1936. Table II shows the total indebtedness of foreign governments to the United States on Jan. 10, 1936, excluding Germany.

TABLE II—TOTAL INDEBTEDNESS OF FOREIGN GOVERNMENTS TO THE U.S.—JAN 10, 1936

Country	Total indebtedness	Principal unpaid ^a	Interest accrued and unpaid under funding and moratorium agreements
Funded debts:			
Austria	\$ 23,898,430	\$ 23,752,217	\$ 146,213
Belgium	423,479,692	400,680,000	19,049,692
Czechoslovakia ..	165,483,257	165,241,109	242,148

Poland	1,417,490	1,124,458	2,541,949
Total	7,434,181,156	2,611,194,155	10,065,375,311

* Not including any payments received by the creditor governments prior to the inception of the Dawes Plan, or any of the amounts realized by creditor governments from sources outside the Dawes and Young Plans

10,065,375,311 marks distributed direct to the creditor governments, Germany paid out under the Dawes and Young Plans the following sums: Service on German External Loan of 1924, 803,994,571 marks; service on German Government International 5½ per cent loan of 1930, 239,990,366 marks; expenses, etc., 113,490,755 marks; re-loaned to German Railway Co. on behalf of the creditor governments, 540,335,002 marks; re-loaned to German Government from Yugoslavia's share in the nonpostponable part of the 1931-32 annuity, 5,379,294 marks; and the undistributed balance in the Bank for International Settlements on Mar. 31, 1935, of 125,633,982 marks. These payments, added to the sums paid direct to the creditor governments, brought the total German reparation payments under the Dawes and Young Plans up to Mar. 31, 1935, to 11,894,199,381 marks.

REPEAL DEBATE. THE. See PROHIBITION.
REPTILES. See ZOOLOGY.

RÉUNION. rä'u'nyōn. A French island colony 420 miles east of Madagascar. Area, 970 sq. miles; population (1931), 197,933 including 194,272 French, 2242 Chinese, 302 Africans, 921 natives of Madagascar, and 196 British Indians. Chief towns: St Denis, the capital (26,807 inhabitants), St. Pierre (22,048), St Paul (22,679), St. Louis (17,237). The chief port was Pointe-des-Galets.

Sugar, rum, manioc, coffee, tapioca, vanilla, and spices were the main products. In 1933, imports (mainly rice, grain, cotton goods) were valued at 146,000,000 francs; exports, 117,000,000 francs of which sugar (56,000 metric tons) accounted for 84,000,000 francs and spirits (46,566 hectoliters), 19,000,000 francs (franc averaged \$0.0501 for 1933). The budget for 1933 was balanced at 63,634,000 francs. Administration was under a governor assisted by a privy council, and an elective council-general. Réunion was represented in the French Parliament by a senator and two deputies.

RHODE ISLAND. Population. On Apr. 1, 1930 (Fifteenth Census), 687,497; July 1, 1934 (latest Federal estimate), 705,000; 1920 (Census), 604,397. Providence, the capital, had (1930) 252,981 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934

Crop	Year	Acreage	Prod Bu	Value
Hay (tame)	1935	43,000	54,000 *	\$ 832,000
	1934	42,000	51,000 *	1,071,000
Potatoes	1935	4,200	735,000	514,000
	1934	4,000	720,000	446,000
Corn	1935	9,000	369,000	295,000
	1934	8,000	328,000	305,000

* Tons

Education. Inhabitants of school age (from 4 to 21 years) were reported as numbering 208,682 in January, 1935. For the academic year ended on June 30, 1935, the number of students in public schools was 124,346; those in private and in parochial schools totaled 33,371. Of the pupils in public schools, 5049 were in pre-elementary classes; in elementary grades, 48,486; in junior high schools, 22,491; in senior high schools, 14,479; in primary schools, 12,896; in grammar schools, 12,178; in mixed schools, 1344; in four-year high schools, 5189, in special schools, 1523; and in vocational schools, 711. The year's current expenditures for public-school education totaled \$9,480,652. Salaries of teachers averaged \$1594.78.

Charities and Corrections. The Department of Public Welfare, under the administrative organ-

ization in effect in 1935, exercised the State's chief central functions in relation to institutions for the care and custody of persons. It operated 11 institutions supported by the State; these contained some 5755 inmates. It also maintained dependent children in private homes at the cost of the State. Its yearly budget somewhat exceeded \$2,500,000.

The State institutions thus operated and their respective totals of inmates on June 30, 1935, were: State Hospital for Mental Diseases, 2370; State Infirmary, 988; Exeter School (mental defectives), 614; State Prison, 541; Men's Reformatory, 160; Women's Reformatory, 32; Sockanosset School (delinquent boys), 221, Oaklawn School (delinquent girls), 39; State Home and School (neglected and dependent), 323; State Sanatorium (for tuberculosis), 385; Soldiers' Home, 82.

Legislation. The regular session of the General Assembly, convening on January 1, proceeded immediately to rid the State of its chief remaining Republican officers. It vacated all five seats on the bench of the State Supreme Court; this it did by authority of a statute already existing, which a Republican Legislature had enacted 35 years before, rendering any member of that Court removable without stated cause, by the simple vote of majorities in both houses of the Assembly. The Court was rendered bipartisan (3 Democrats, 2 Republicans). On the same day an act was passed abolishing the Board of Public Safety that a Republican Legislature had created to control the police and fire forces of the Democratic city of Providence; also was enacted a bill consolidating more than 80 separate branches of the State Government into 11 departments. Later the Legislature altered a system of appointment to offices which was regarded as having given the State Senate a virtual appointing power. The flock of anti-Republican measures was regarded by Democrats as merely nullifying advantages that Republicans had dealt to themselves before the overturn of 1934.

At the outset of the session the Republicans seemed to have a slight Senate majority; but two Republicans who claimed election to the Senate were voted out on a recount; thus Democratic control was assured.

A system of pensions, payable by the State to persons 65 years old or more who had not more than \$3000 of property, was created, to go into effect on July 1; an appropriation of \$200,000 was made toward covering its operation during 1935. For the rate of the pensions a maximum of \$30 a month was set.

A special session held in May passed the yearly appropriation bill and enacted a reorganization bill designed to set in order the details of the administrative consolidations effected by the regular session.

Political and Other Events. A special election was held on August 6 to elect a United States Representative to fill a vacancy in the First District and to decide by referendum of the whole State whether the State should borrow \$8,000,000 from the Federal Government for projects of construction to the cost of which the Government would donate 45 per cent outright. In the First District Charles F. Risk, Republican, was elected Representative by a vote of 48,023 to 35,054 (unofficial), over Antonio Prince, Democrat. The Federal loan and bounty for public works were rejected; and an issue of \$3,000,000 in State bonds, for contribution to the support of the destitute unemployed by a direct dole, was adopted.

This election was taken as a sign of the decline of

the popularity of the "New Deal" in the Nation. Its significance, as to the First District, lay in the fact that this constituency had elected a Democratic Representative less than a year before by 70,518 votes to 49,087. However, the National aspect of the August election was qualified by some reaction against recent Democratic measures of State partisanship and by the dissatisfaction common in the textile areas, throughout New England, with the processing taxes, which were on the contrary popular in the agricultural South and West.

Officers. The chief officers of the State, serving in 1935, were: Governor, Theodore Francis Green; Lieutenant-Governor, Robert E. Quinn; Secretary of State, Louis W. Cappelli; Attorney-General, John P. Hartigan; General Treasurer, Antonio Prince; Budget Director and Comptroller, Christopher Del Sarto.

Judiciary. Supreme Court: Chief Justice, Edmund W. Flynn; Associate Justices, William W. Moss, Francis B. Condon, Hugh B. Baker, Antonio A. Capotosto. Superior Court: Presiding Justice, Jeremiah E. O'Connell.

RHODES. See *ÆGEAN ISLANDS, ITALIAN.*

RHODESIA, NORTHERN. A British protectorate in Africa. Area, 290,320 sq. miles; population (1934), 1,378,077 of whom 1,366,425 were Africans and 11,464 were Europeans. Chief towns: Lusaka (capital); Livingstone; Broken Hill; Fort Jameson, Mazabuka.

Production and Trade. Maize, wheat, tobacco, coffee, oil seeds, and citrus were the main agricultural crops. Livestock raising was carried on by many of the farmers. Mineral production (1934) was valued at £4,776,134 of which copper (137,897 tons) represented £4,165,932; cobalt (571 4 tons), £320,000; zinc (19,540 tons), £265,698; gold (2113 oz.), £14,511. During 1934, imports were valued at £2,957,117 exclusive of government stores (£42,204) and specie (£4416); exports were valued at £4,530,933 exclusive of specie (£9462).

Government. For the year 1934, revenue amounted to £693,337; expenditure, £712,903; public debt, £2,347,000. Government was vested in a governor aided by an executive council of 5 members, and a legislative council of 16 members. Governor in 1935, Sir H. W. Young.

History. During May, 1935, 11,000 natives employed in the copper mines engaged in serious rioting in protest against the introduction of a higher poll tax. At Luanshya the natives wrecked the mine compound offices but they were stopped in their attempt on the power house when six of their number were killed by troops. Order was restored by the end of May.

The new capital at Lusaka was officially inaugurated, on May 28, 1935, by Gov. Sir Hubert Young. It was announced during October, 1935, that an agreement had been ratified for the erection of a hydro-electric station at Victoria Falls to supply electricity in bulk to the town of Livingstone.

RHODESIA, SOUTHERN. A British Dominion in South Africa. Area, 150,344 sq. miles; population (June, 1934), 1,212,000 including 52,950 Europeans, 1,154,000 natives, and 4550 others. Chief towns: Salisbury, the capital (29,000 inhabitants in 1934), Bulawayo (33,000), Umtali, Gwelo, Gatooma, Que Que, Shamva, Wankie, Victoria.

Production and Trade. Maize, cotton, tobacco, groundnuts, legumes, oranges, and lemons were the main agricultural products. Dairying was an important industry. Livestock (1933): 2,688,677 cattle, 323,940 sheep, 79,176 swine. Mineral output (1934): gold (21,550 kg.), silver (3993 kg.),

chrome ore (72,100 met. tons), coal (643,000 met. tons), asbestos (29,200 met. tons). In 1934 (provisional figures), imports amounted to £5,562,000 including bullion and specie (£340,000); exports, £8,779,000 including bullion and specie (£5,110,000).

Government. For the year ended Mar. 31, 1934, revenue amounted to £2,465,380; expenditure (including loan expenditure, £354,034), £2,858,442; public debt, £8,969,315. Budget estimates (1934-35): revenue, £2,501,000; expenditure out of revenue, £2,522,686. Government was vested in a governor assisted by an executive council, and a legislative council. Governor and Commander-in-Chief, Sir H. J. Stanley; Prime Minister, G. M. Huggins.

RICE. Data on the world's rice production generally are incomplete and not closely up to date. Towards the close of the calendar year 1935 only nine countries had reported estimates of production for the crop-year 1935-36 to the International Institute of Agriculture. Of these the leading countries and their yields were as follows: Japan 518,815,000 bu., Chosen 161,992,000 bu., Taiwan (first annual crop) 39,354,000 bu., and Italy 32,209,000 bu. of rough rice of 45 lb. per bu. Statistics published in the *Yearbook* of the U.S. Department of Agriculture for 1935 place the world's estimated total production of cleaned rice for the year 1933-34 exclusive of China, at 134,000,000,000 lb. The Chinese crop of cleaned rice in 1934 was estimated at 77,280,000,000 lb., and the Indian crop at 67,991,000,000 lb. Indo-China and Java and Madura together produce each about 8,000,000,000 lb., Siam about 6,000,000,000 lb., and the Philippines about 3,000,000,000 lb. of cleaned rice annually.

The 1935 rice crop of the United States was estimated by the Department of Agriculture at 38,296,000 bu. which was slightly above the preceding crop but below the average of 43,017,000 bu. for the five years 1928-32. Arkansas, Louisiana, and Texas produced 31,778,000 bu., compared with 30,631,000 bu. in 1934 while California harvested 6,664,000 bu. in comparison with 7,665,000 bu. the year before. The average yield per acre in 1935 and 1934 was 49 bu. compared with average of 43.3 bu. for the 10 years 1923-32. The rice acreage in 1935 was 784,000 acres, 3000 acres above the area in 1934 and the smallest since 1914. The average farm price for the uncompleted 1935 marketing season was 62.4 cents and for the marketing season of 1934 79.2 cents. At these prices the total value of the 1935 rice crop was \$24,011,000 and of the 1934 crop \$30,332,000. The individual yields of the three rice producing States other than California for the year were reported as follows: Louisiana 16,808,000 bu., Texas 8,632,000 bu., and Arkansas 6,348,000 bu.

The United States during the fiscal year ended June 30, 1935, exported 122,425,000 lb. of rough and milled rice and 279,000 lb. of rice flour and other rice products and imported 5,551,000 lb. of uncleaned rice, 24,382,000 lb. of cleaned rice, not including patna, 1,832,000 lb. of patna, and 36,725,000 lb. of rice meal, rice flour, and broken rice.

RICE, EDWIN WILBUR, JR. An American electrical engineer and utility corporation official, died at Schenectady, N. Y., Nov. 25, 1935. Born in Lacrosse, Wis., May 6, 1862, he graduated from the Central High School, Philadelphia in 1880. His ingenuity and mechanical ability brought him to the attention of Elihu Thomson, the professor of chemistry at the school, who invited him to join

him as assistant in the foundation of the American Electric Co., at New Britain, Conn. In 1883, its name was changed to the Thomson-Houston Electrical Company, and young Rice was made superintendent. During the period of their association, Rice and Professor Thomson collaborated on many inventions, principally on the Thomson-Rice arc lamp (1884). An able executive as well as an inventor, Rice so systematized the work of the plant that expenses were reduced and production increased.

In 1892 the Company merged with the Edison General Electric Company under the name of the General Electric Company, and two years later Rice was made vice president, serving until 1913 when he was made president. He retired in 1922 and the position of honorary chairman of the board was created for him. The rise of the General Electric Company to the position it now holds in the industrial field may well be attributed to the ability and efforts of Edwin Rice, for by his broad views of the needs of the electrical industry, the Company's research laboratories were established in 1900, and proved an indispensable asset to industrial and scientific progress.

Mr. Rice was a fellow of the American Institute of Electrical Engineers, and was its president in 1917. In 1910 he was made a Chevalier of the Legion of Honor, and later was decorated with the Order of the Rising Sun, 3d Class with Cordon, by the Japanese Government. In 1931 the Edison Medal of the American Institute of Electrical Engineers was conferred upon him for "his contribution to the development of the electrical systems and his encouragement of scientific research in industry." Mr. Rice held over 100 patents, and for 25 years was a trustee of Union College.

RICE INSTITUTE. A coeducational institution for higher education in Houston, Texas, opened in 1912. The enrollment in the autumn of 1935 was 1314, and the faculty numbered 85. The plant equipment and productive funds of the institution were estimated at \$15,000,000, and the income from endowment for the fiscal year 1934-35 was in excess of \$600,000. The library contained approximately 122,150 volumes. President, Edgar Odell Lovett, Ph.D., Sc.D., LL.D.

RICHET, ré'shâ', CHARLES. A French physiologist, the son of Alfred Richet, died in Paris, Dec. 3, 1935, where he was born, Aug. 26, 1850. He was educated at Lycée Bonaparte and in 1869 began the study of medicine, becoming an interne in 1872, and receiving his medical degree at the School of Medicine in 1876. Three years later he received a prize from the Institute of France for his monograph, *Propriétés chimiques et physiologiques du suc gastrique*, and after 1881 he became a member of the French Biological Society. He succeeded Béclard as professor of physiology in the medical faculty of the University of Paris in 1887, and in 1889 was elected a member of the Academy of Medicine.

Dr. Richet is known especially for his work in serotherapy, the treatment of disease by injecting into the veins serum from immunized animals, and anaphylaxis, increased susceptibility to a toxic or remedial agent after a primary dose has been received into the blood. For his researches in connection with the last-named, he received the Nobel Prize for medicine in 1913.

Becoming interested in vivisection, he discovered in 1894 an anæsthetic that was a combination of chloral and glucose, which although a pain-killer, was preservative of the reflex motions necessary

to vivisection studies. His interest was held also by psychical research and in 1905 he served as president of the Society of Psychical Research in London. As late as 1922 he wrote what was virtually a textbook upon the subject, *Traité de Métapsychique*, which, in the following year, was translated into English as *Thirty Years of Psychical Research*. A smaller volume, *Our Sixth Sense*, based on this work, appeared in English in 1929. Ever a peace advocate, the Doctor published *Les Guerres et la paix* (1901) and *Le Passé de la Guerre et l'avenir de la paix* (1907), and subsequently became president of the Société pour l'Arbitrage entre nations. He served in the World War.

Besides translating into French Harvey's *Circulation of the Blood* (1879), Richet published many interesting works, including: *Les Poisons de l'intelligence* (1877); *Recherches expérimentales et cliniques sur la sensibilité* (1877); *Structure des circonvolutions cérébrales* (1878); *Du Sac gastrique chez l'homme et les animaux* (1878); *Physiologie des muscles et des nerfs* (1882); *L'Homme et l'intelligence* (1884); *Essai de psychologie générale* (1887); *La Physiologie et la Médecine* (1888); *La chaleur animale* (1889); *Physiologie, travaux du laboratoire* (3 vols., 1892-95); *Dictionnaire de physiologie*, with others (1895-1906); *L'Anaphylaxie* (1911; Eng. trans 1913); *War Nursing* (Eng. trans., 1918); *L'Homme Stupide* (1919); *Traité de Physiologie Médico-chirurgicale*, with Charles Richet, jr. (1921); *L'œuvre de Pasteur* (1923); *L'Homme impuissant* (1926; Eng. trans., 1928); *Histoire naturelle d'un savant* (also in English, 1927); *L'Intelligence et l'Homme* (1927). In 1875 he issued *Poésies* under the pseudonym of "Charles Epheyre." Also, he wrote several works of fiction, chief among which were *Possession* (1890) and *Sœur Marthe* (1892), which were dramatized in 1891 and 1893 respectively.

Dr. Richet was a Commander of the Legion of Honor, and in 1932 was elected president of the French Academy of Sciences.

RIOUW-LINGGA. See NETHERLAND INDIA.

ROADS AND STREETS. Fifty-six per cent of the Federal-aid highway system of the United States, or 127,000 out of some 227,000 miles, had been completed, and 90 per cent improved in some degree on June 30. For the fiscal year 1935-36, three appropriations were made: Regular Federal-aid system and extension through cities, \$125,000,000; emergency relief, \$200,000,000 for highways and \$200,000,000 for eliminating dangerous grade crossings. Of the two latter sums, about 50 per cent will be spent on the Federal-aid system, 25 per cent on its operation through cities, and 25 per cent on secondary roads.

A Massachusetts innovation was provision of sidewalks along State highways. The legislature of 1935 allocated for sidewalks a third of its appropriation of \$12,000,000 to alleviate unemployment through public works construction. It was estimated that the appropriation, combined with Federal aid, would build 500 miles of walks, ranging from 24-in. foot paths to 8-ft. sidewalks. In general, the plan was to build 4-ft walks, surfaced with bituminous cement-concrete.

Australia and Africa. A novel method of making an improved road surface in parts of Australia where no gravel or rock for crushing is available has been tried on a large experiment scale in the

inland areas of New South Wales and Queensland. The soil, which is composed of adobe clay, is softened by even light rains, making passage difficult. To meet these conditions a slowly traveling furnace has been devised for baking the natural soil in place. A scarifier at the front of the machine tears up the earth before it is burned. After breaking down the burned clods with a roller and applying a clay binder the roadway is again rolled and is ready for traffic. To meet conditions where no roads exist and it is not feasible to build them, British engineers in the African colonies and in the interior of Australia have made trials of motor truck-trailer trains operating over long trackless reaches of country.

England, Germany, and Italy. A five-year British highway construction programme at an estimated cost of \$500,000,000 was officially announced on November 8. In Germany, a new motor highway between Darmstadt and Frankfurt-on-Main was dedicated early in the year, as the first link in a \$750,000,000 construction plan. In the course of a half dozen years it is expected that 5000 miles of roads will be improved, radiating from Frankfurt-on-Main. A belt highway encircling Greater Berlin for 112 miles is being built. (See *Zeitschrift des Vereines Deutscher Ingenieure*, Feb. 16, 1935, abstracted in *Engineering News-Record*, July 25, 1935, p. 111.) "From the most miserable road system in Europe," Italy is creating "a state-road and super-highway system that in quality challenges comparison with the highways of the world," says the journal last named.

Mexico, Central America, and Peru. A highway from Laredo, Tex., to Mexico City had been nearly completed in May. Only 56 of 760 miles then remained for construction. A reconnaissance survey for the Isthmian portion of a Rio Grande-Panama highway includes the line already mentioned and carries it from Mexico City to the city of Panama. Aerial surveys were a feature of the studies made for the route. In Peru a highway from Lima to Oroya, 111 miles, was opened on July 1.

References. For a symposium on Low-Cost Roadbuilding, see *Engineering News-Record*, June 27, 1935, pp. 905-10. See the same journal for details of some of the topics treated briefly in the preceding text: Massachusetts country sidewalks, Oct. 31, p. 610; Rio Grande-Panama highway, with line and aerial maps, May 30, pp. 766-69; Italian highway programme with maps and views, Nov. 14, pp. 665-74; Australian truck-trailer trains, and road surfaces baked in place, June 6 and August 8, pp. 185 and 812.

ROBINSON, EDWIN ARLINGTON. An American poet, died in New York City, Apr. 6, 1935. Born at Head Tide, Me., Dec. 22, 1869, he attended Harvard University for two years (1891-93), and for a few months was secretary to Charles S. Eliot, its president. He returned to Maine, and in 1896 his first book, which contained *The Torrent* and *The Night Before*, was published privately. He next issued *The Children of the Night* (1897) which confirmed his originality, but also emphasized the fact that he was for the few rather than the many. The critic, Edmund Clarence Stedman, acclaimed him as "a new poet of an individual cast of thought."

Robinson settled in New York City in 1900 and two years later issued *Captain Craig*, by which his position as a poet was assured. This volume was reissued, and in 1905, President Theodore Roosevelt, writing in *The Outlook*, introduced him to

the American public as the foremost poet of his era. *The Children of the Night* was then republished, and in 1910, *The Town Down the River*, that contained "Miniver Cheevy," his most quoted poem, was issued. For five years (1905-10) he served in the United States Customhouse, New York, through an assignment by President Roosevelt, who had offered him a post in the Embassy at Mexico, that he had declined. Then he turned his attention to playwriting, and wrote *Van Zorn* (1914) and *The Porcupine* (1915), but in the following year returned to his original muse and produced *The Man Against the Sky* (1916), that in turn, was followed by a presentation of the Arthurian legends, *Merlin* (1917) and *Lancelot* (1920), for which he was awarded the Lyric prize. In 1921 he issued *Collected Poems*, that were awarded both the Pulitzer Prize and the annual prize of the Poetry Society of America in that year. Twice again he received the Pulitzer Prize, first for *The Man Who Died Twice* (1924), and second for *Tristram* (1927), which was written in blank verse and ranked with the best of that type of work.

Considered the most representative of modern American poets, Robinson was neither a romanticist nor a pessimist, and his interpretation of life was as he found it, real, earnest, and serious. His work was distinctly intellectual, sincere in feeling, distinctively American in tone and point of view, and free from all that is trivial and meaningless. Upon a first reading, it might be considered cold, but upon reflection it is found to have passages of quiet beauty that illuminate the entire work with a glowing light.

Other of his works are: *The Three Taverns* (1920); *Avon's Harvest*, "his dime novel in verse" (1921); *Roman Bartholomew* (1923); *Dionysius in Doubt* (1925); *Collected Poems* (5 vols. 1927); *Sonnets* (1928); *Cavender's House* (1929); *The Glory of the Nightingales* (1931); *Nicodemus* (1932); and *King Jasper*, "a modern satirical comedy of humours," issued posthumously (1935).

He was a member of the National Institute of Arts and Letters and of the American Academy of Arts and Letters, and received the Gold Medal of the Institute in 1929.

ROCHESTER, UNIVERSITY OF. A nonsectarian institution of higher education for men and women in Rochester, N. Y., founded in 1850. It consists of three schools—the college of arts and sciences, composed of a college for men and a college for women on separate campuses, the Eastman School of Music, and the school of medicine and dentistry. A school of nursing is also maintained in conjunction with the Strong Memorial Hospital, the property of the university. The enrollment for the autumn session of 1935, exclusive of extension division and special music students, totaled 1947, distributed as follows: Arts and sciences, 1162; music, 285; medicine and dentistry, 169; graduate students, 231. For the summer session, 439 were enrolled in the arts college and 385 in the music school. There were 355 members on the faculty. The amount of endowment was \$54,093,147, and the total income for the year 1934-35 was \$3,659,471. The library contained 279,960 books. President, Alan Valentine, LL.D.

ROCKEFELLER FOUNDATION, THE. An institution chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." Its programme is concerned with certain definite problems in the fields of medical science, natural science, social science, the humanities, and public health. For work in

these fields the Foundation during the year 1935 appropriated approximately \$14,350,000 and expended approximately \$13,000,000. In addition to the new grants made during 1935, enumerated below, the Foundation continued to make payments toward many projects initiated in 1934 or earlier years, where support or assistance over a period of years was specified in the original appropriations.

The Humanities. A new programme in the humanities was developed during the year. Appropriations made in connection with this programme fall into the following groups: (1) grants directed toward developing available techniques and methods for increasing the area of public appreciation of cultural activities in the United States, and (2) support of projects planned to foster cultural interchange with other countries by improving methods of international communication.

For the work in the United States the following grants were made: to the Brooklyn Museum, for training personnel in the use of new techniques in visual presentation of museum objects; to the New York Museum of Science and Industry, for developing new methods of museum exhibition; to the University of North Carolina, Western Reserve University, and the State University of Iowa, for work in dramatic art; to Yale University, for the development of the library of the Department of Drama, to the Play House Foundation, Cleveland, Ohio, for a programme in community drama; to the University Broadcasting Council of Chicago, for developing radio programmes of educational and cultural value, and to the Museum of Modern Art, New York City, for the establishment of a motion picture department.

The programme for the advancement of international cultural understanding provides for (1) aid to national libraries in Europe and the Far East, for the training of personnel and for the establishment of modern services for finding and purchasing new publications; (2) the encouragement of mutual understanding between the United States and the Orient through support of facilities for training Americans in the Japanese, Chinese, and Russian languages, and aid for the dissemination of knowledge of Far Eastern cultures through the colleges, secondary schools, museums, and libraries of the United States, and (3) assistance in connection with the teaching of English as an auxiliary language and its use in international broadcasting for cultural purposes. Support given during 1935 for work along these lines included grants to the National Library of Peking, for bibliographical work, to the Bibliothèque Nationale for classifying its collection of Library of Congress index cards, to the Library Association, London, England, for the establishment of a service of information on library practice; to the Library of Congress, Washington, D. C., to enable its Far Eastern Centre to provide training in Chinese and Japanese; to the American Council of the Institute of Pacific Relations, for experiments in intensive teaching of the Chinese language to English-speaking students; to the Orthological Institute, London, England, for its work in adapting Basic English for use in the Far East; to Harvard University, for the preparation of material for the teaching of Japanese art; to Columbia University, for studies of English usage, to be carried out at the Institute of Educational Research, Teachers College, under the direction

of Prof. E. L. Thorndike, for the purpose of determining, for the guidance of persons preparing textbooks for the teaching of English as a secondary language, what words should be included in an initial English vocabulary; to World Wide Broadcasting Foundation (Station WIXAL), Boston, for its programme of international broadcasting.

The Medical Sciences. The greater proportion of the appropriations made during the year in the field of medical science were for the advancement of research in psychiatry and neurology. Funds were provided for a comparative study, by Prof. J. G. FitzGerald, of the teaching of preventive medicine, public health, and hygiene in medical schools of North American and Western Europe; for the support of fellowships in the medical sciences administered by the Foundation; and for grants-in-aid for workers engaged in research of importance in connection with the Foundation's programme in the medical sciences.

The Natural Sciences. In the natural sciences, support was given chiefly for biological research, especially for work contributing to an understanding of human behavior. Appropriations for projects dealing with nutrition problems, internal secretions, or sex research were made to the Ohio State University, for research on the chemical, physiological, and clinical aspects of the hormone of the adrenal cortex; to the University of California, for the study of the chemical aspects of vitamins and hormones, to the Laboratory of Histology of the University of Paris, for research on endocrinology and vitamins; to the University of Virginia, for research on endocrinology; to the University of Rochester, for research on the physiology of reproduction in the monkey.

The largest group of projects aided comprised those in which physical, chemical, or mathematical techniques were directed toward the solution of basic biological problems, and included grants to McGill University, George Washington University, Columbia University, the Institute of Physics of the Polytechnic School, Graz, Austria, the Massachusetts General Hospital, and the universities of Chicago, Michigan, Rochester, Copenhagen, Leeds, Oxford, Stockholm, Uppsala, and Utrecht. Coordinated programmes of research in a number of related fields of modern biology in which the Foundation is especially interested were aided by grants to the University of Chicago, Ieland Stanford, Junior, University, and the California Institute of Technology, as well as to the National Research Council, for the work of its Committee for Research in Problems of Sex and the Committee on Effects of Radiation upon Living Organisms. An appropriation was also made to the Long Island Biological Association toward the expenses of symposia to be held in the summers of 1936 and 1937.

In carrying through projects aided under the former natural sciences programme, a grant was made to the Woods Hole Oceanographic Institution, for endowment, and another to Harvard University, for research in geophysics.

Other grants were made to the American Institute of Physics, for underwriting its plan for financing scientific publications, to the Massachusetts Institute of Technology, toward costs of developing an improved differential analyzer, a device for the mechanical solution of differential equations; to the National Research Council, for its fellowship programme in the physical and biological sciences, and toward the expenses of editing

and indexing *Biological Abstracts*. Funds were also made available to provide grants in aid for selected workers carrying on research in the natural sciences, and for fellowships in this field administered by the Foundation.

Public Health. In the field of public health, funds were supplied for research on a number of selected diseases, for demonstrations in the control of certain of these diseases in their environments, for coöperation with governments in the organization or improvement of important services of central or local departments, for State health surveys, and for the development of public health education. Fellowships in public health and public health nursing were provided and health personnel were given opportunities for training in connection with the health demonstrations and through travel.

The Social Sciences. In the social sciences, interest centred on international relations, economic security, and public administration. In the sphere of international relations, grants were made to the Institute of Pacific Relations and to the Council on Foreign Relations, for their research programmes; to the Foreign Policy Association, for the support of its experimental educational programme and its research department; to Yale University, for the research programme of its Department of International Relations; to the Center for Studies of Foreign Politics, Paris, and the John Casimir University, Lwow, Poland, for research on problems of international relations; to the International Institute of Intellectual Coöperation, Paris, for the organization of the research programme of the International Studies Conference and the maintenance of a secretariat; to the American Geographical Society, for the preparation and publication of a Millionth Map of Hispanic America; and to Prof. H. C. Taylor, for a world-wide study of agricultural economics, with particular reference to national and international planning.

In the interests of economic security, contributions were made to the Social Science Research Council, for work in connection with social insurance and organized relief; to the Industrial Relations Counselors, Inc., for providing services on an unpaid basis to state and Federal agencies, in the field of economic security; to Harvard University, for research on the business cycle; to the Austrian Institute for Business Cycle Research, toward its general budget; to the Wharton School of Finance and Commerce, University of Pennsylvania, toward the support of its Department of Industrial Research; to the University of Manchester, England, the Polish Academy of Science, and the University of Sofia, toward the support of economic research.

The programme in public administration included grants to the Spelman Fund of New York, for the support of its work in this field; to the Social Science Research Council, for the use of its Public Administration Committee; to Harvard University, toward the support of its programme of training for public service; to the School of Citizenship and Public Affairs, Syracuse University, for the expansion of its training course in public administration, to the American University, Washington, D. C., for the support of a programme for training junior executives in the Federal service in the principles of public administration; to the National Institution of Public Affairs, Washington, D. C., for directing the programmes of graduate students attached to the Federal service for the purpose of obtaining practical field experience; to the Community Council of Philadelphia, toward the sup-

port of the Joint Committee on Research; to the New Hampshire Foundation, for research on the administration of state and local governments.

An appropriation was made to the Social Science Research Council, for its fellowship programme, and funds were provided for fellowships in the social sciences administered by the Foundation, and for grants in aid for research workers.

Officers. The executive officers of the Foundation in 1935 were: John D. Rockefeller, Jr., chairman of the Board of Trustees; Max Mason, president; Thomas B. Appleget and Selskar M. Gunn, vice presidents; Alan Gregg, M.D., director for the medical sciences; Warren Weaver, director for the natural sciences; Edmund E. Day, director for the social sciences; David H. Stevens, director for the humanities; Frederick F. Russell, M.D. (retired, September, 1935), and Wilbur A. Sawyer, M.D., directors of the International Health Division; Norma S. Thompson, secretary; Lefferts M. Dashiell, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel, and Chauncey Belknap, associate counsel. Offices were maintained at 49 West Forty-ninth Street, New York City.

ROGERS, WILLIAM PENN ADAIR, "WILL." An American humorist of part Indian ancestry, died in an aeroplane accident at Walkpi, near Pt. Barrow, Alaska, Aug. 15, 1935. He was born at Oologah, Indian Territory, Nov. 4, 1879, and attended the Willie Hassell School, Neosha, Mo., and the Kemper Military Academy at Boonville, Mo. With money received from the sale of a ranch, he set off to see the world. He traveled in Africa, China, and Australia, and when his money ran out, his skill with the lariat found him work with a Wild West show in Australia. Later he joined Zack Mulhall's Wild West Troupe.

His first appearance on the vaudeville stage was made in New York in 1905. His act consisted of roping a horse with one lasso and its rider with another. He first began to speak on the stage in order to explain the difficulty of his act, but it was not until 1912 that he was successful as a monologist. His first appearance on the legitimate stage was made three years later in *Hands Up*. In September of that same year he appeared in *Town Topics*, and in 1917 he was in *The Passing Show* and the *Ziegfeld Folies*. It was during this period that he began to develop his spontaneous wit and to read the newspapers so carefully. He left the *Folies* in 1918 to appear in motion pictures, achieving a moderate success. In 1921 he appeared in the *Midnight Frolic*, but after a year returned to the screen.

In 1922 and again in 1924 the stage claimed him and he played in the *Folies* at one of the largest salaries ever paid to an actor. In recent years, Mr. Rogers had deserted the stage for the screen, but in 1928, when Fred Stone was injured and had to leave the cast of *Three Cheers*, he took his place and appeared until Mr. Stone was able to rejoin the troupe. His last appearance on the stage was with a road company of *Ah Wilderness*.

Upon the advent of the talking picture, Rogers again essayed this field and proved very successful. He appeared in *They Had to See Paris* (1929), *Happy Days* and *So This Is London* (1930); *Ambassador Bill*, *Business and Pleasure*, *Down to Earth*, and *Too Busy to Work* (1931, 1932); *State Fair*, *Doctor Bull*, *Mr. Skitch*, and *David Harum* (1933); *Handy Andy* and *Judge Priest* (1934); *The County Chairman*, *Life Begins at Forty*, *In Old Kentucky*, and *Steamboat 'Round*

the Bend (1935), the last two named released posthumously.

Mr. Rogers, one of America's foremost humorists, with his homespun philosophical comment upon affairs of the day, won a large audience with his syndicated newspaper articles and his radio appearances. From 1926 he contributed daily to the *New York Times*, and more recently he appeared on various commercial radio programmes. On one occasion he gave an imitation of President Coolidge which caused a great furor. In 1924, as well as in 1928, he covered the national political conventions for the *New York Times*, and he himself had received nominations for various offices, at one time even being seriously considered as a presidential nominee. For several years he was the Mayor of Beverly Hills, Calif. Also, on several occasions he acted as "good will" ambassador to foreign countries.

Much of his time was devoted to raising funds for charities, particularly Red Cross relief, and he was especially active at the time of the Mississippi Flood in 1927 and the Drought Relief Campaign of 1930-31. In October, 1935, he was posthumously awarded the Spirit of St. Louis Medal of the Aeronautical Division of the American Institute of Mechanical Engineers for his interest in and aid to aviation. It was while on a vacation flight with Wiley Post (q.v.), the aviator, that he met his death.

Mr. Rogers published *The Cowboy Philosopher on Prohibition* (1919); *The Cowboy Philosopher on the Peace Conference* (1919); *What We Laugh At* (1920); *Illiterate Digest* (1924); *Letters of a Self-Made Diplomat to His President* (1927); *There's Not a Bathing Suit in Russia* (1927); *Will Rogers's Political Follies* (1929).

ROLLINS COLLEGE. A nonsectarian, coeducational institution of higher learning in Winter Park, Fla., founded in 1885. The enrollment for the fall term of 1935-36 was approximately 400. The full-time faculty members numbered 56. The productive endowment, and other invested funds serving as endowment, amounted to approximately \$1,250,000, yielding an annual income of about \$53,000. The income from all other sources was in excess of \$250,000. The library contained approximately 46,000 volumes, in addition to 5000 public documents.

Rollins was the first college to change from the old established method of charging only part of the cost as tuition to the unit cost plan, which charges the student the full cost of instruction and sets aside endowment income and gifts for the benefit of those who cannot pay cost, exclusively. This was made effective with the class entering in September, 1933. President, Hamilton Holt, Litt.D., LL.D.

ROMAN CATHOLIC CHURCH. The concluding ceremonies of the extension of the Holy year; the issuance of important announcements, particularly against war and for peace; Eucharistic Congresses, and several canonizations were noteworthy events in the Church during 1935. As a climax to the end of the Holy Year, Pius XI in January directed a triduum of public prayers in April at Lourdes with all the faithful associating themselves. He announced an extraordinary dispensation for the event. "We have thought there could be no better way to crown the Jubilee Year . . . than by having the Sacrifice of the Holy Eucharist celebrated uninterruptedly for three days and nights at the miraculous Grotto of Massabielle in an atmosphere of ardent piety. . . . We trust, therefore, that to the abundant fruits of the Holy

Year, still other and more copious will be added, and that, through the intercession of the Immaculate Virgin, the rainbow of peace will finally arise over the tormented world." On March 17, at the reading of the decree proclaiming the heroism and virtue of Venerable Mother Philippine-Rose Duchesne, who established the first houses of the Sisters of the Sacred Heart in America, the Pope gave a particular blessing to France and the United States. In an allocution on April 1, at the secret consistory for the canonization of John Cardinal Fisher and Sir Thomas More, English Martyrs proclaimed on February 16, the Holy Father spoke on current threats to peace. "There is cause indeed for sadness. While the damage of the last European War has not yet been repaired, We behold again the horizon darkening with evil clouds. . . . That peoples should again take up arms one against the other; that the blood of brothers should again be shed; that on the earth and sea and from the sky destruction and ruin should be shed on all would be a crime so enormous . . . that We believe it absolutely impossible. . . . But if any should dare to commit this evil crime . . . then the least We shall be able to do is to turn to God with embittered soul and the prayer: 'Scatter Thou the nations that delight in wars.'"

Of the English Martyrs, His Holiness expressed "confidence that this will be a fortunate and happy presage not only for Our beloved English people, but also for the whole Catholic Church. . . . We hope that this solemn occasion is bringing special fruit to those having the same country and language as the Blessed Martyrs. We know, in fact, that . . . particularly in our days the English feel more ardently a home-sickness for the faith of their fathers and a return to the Apostolic See, which first took the Christian faith and worship to England and which, while non-Catholic sects are constantly crumbling, remains the sole base and column of truth." After addressing the gathering at Lourdes by radio on April 29, the Pope descended to St. Peter's where he solemnly intoned a *Te Deum* and took part in the Solemn Holy Hour of Adoration. On May 19, the Pope entered St. Peter's, where 40,000 were gathered, and proclaimed the canonization of Saints Thomas More and John Cardinal Fisher. The Pontiff requested prayers "that England . . . meditating on the lives of the two Martyrs, may follow them in their faith and return to their Father's House in unity of faith and knowledge of the Son of God. Let those who still are separated from Us consider attentively the ancient glories of the Church of Rome. Let them consider and remember that this Apostolic See has been waiting for them so long and so anxiously, not as coming to a strange dwelling place, but as returning to their paternal home." The creation of the two Saints at this time was hailed as most opportune in answer to modern conflict between Cæsar and God.

To a deputation of Belgium journalists on June 3, the Pope called the Catholic Press an "all important apostolate for the Propagation and conservation of Catholic faith and morals." He spoke also of the International Catholic Press Exposition to be held in Vatican City in 1936, and expressed the hope that it will be attended by excellent results and prove a revelation, particularly as regards the missionary press. On July 29, he participated in the ceremonies marking the reading of the decree of heroism and virtues of Justin de Jacobis, Italian Lazarist priest and first Vicar Apostolic to Ethiopia. Although "between Italy

and Ethiopia, the sky is crossed by clouds," Pius XI declared he "hopes and will always continue to hope in the Peace of Christ and in the Kingdom of Christ." The Church struggle in Germany was referred to in his address to German Catholic youths from the diocese of Trier on August 6.

On July 31 morning, the Holy Father left Vatican City to motor to his estates at Castelgandolfo for relief from the city's heat during the summer. Audiences and work were continued there uninterruptedly. On August 31, he received 1500 women delegates to the International Committee of Catholic Associations of Nurses and delivered an important statement on the Italo-Ethiopian war.

"We already see that abroad they speak of conquest and an offensive war," he declared. "This is a hypothesis whereon We wish not to dwell. War of pure conquest would be unjust, an indescribably sad and horrible war. . . . In Italy it is said to be a just war, because it is a war of defense to insure frontiers against continuous, incessant dangers and a war becomes necessary to care for the expansion of a population that is always increasing. However, it is true that, if this need for expansion exists and that there is also necessity to insure frontiers, We cannot but hope that it will be possible to arrive at a solution of every difficulty by other means than war. . . . It seems to Us beyond doubt that, if the necessity for expansion is a fact which must be taken into consideration, the right of defense has limits and confines which must be observed so that defense will not be a guilty one. In any case, We pray that God will second the activity and industry of those far-seeing men who understand the exigencies of the real happiness of people and of social justice—those men who do everything possible, not by means of threats, which cannot but aggravate the situation by irritating spirits; not by temporizing, through which precious time is lost, but with truly humane intention and by the utmost exertion of efforts advance the work of pacification with the aim of preventing war. We pray that God will bless this activity. We ask you to pray with Us." The Pope celebrated Mass on September 7 in the Basilica of St. Paul-without-the-Walls for 12,000 war veteran pilgrims from 16 countries and 2000 chaplains. In an address to them he spoke of his desire "that the hopes and needs of a great and good people, who are also Our people, their aspirations and exigencies, be recognized and satisfied but with justice and peace, because opposed to justice is sin alone and sin renders people miserable, with peace because peace is already in itself far removed from all those evils that war brings for all people who are guilty of it, and because peace is an essential condition to all prosperity and welfare." The Pope declared, in inaugurating the new Vatican astronomical observatory at Castelgandolfo on September 30, that he considers scientific activity an integral part of his priestly ministry. On October 28, addressing the concluding ceremonies of the First National Eucharistic Congress of Peru in Lima, the Pope prayed: "May God grant that this Christian spirit, the sole source of true peace, be diffused over all the earth and quickly come and move and reconcile the hearts in those parts, above all of Europe and Africa, where peace, alas, is already too disturbed and gives fear of worse misfortune." Declaring at the Secret Consistory on December 16 that he did not wish to speak of the Italo-Ethiopian conflict for fear his words might be misunderstood or deliberately distorted, Pius XI said:

We have repeatedly said all that could in this connection be justly and legitimately expected from us in the interests of truth, justice, and charity. . . . Let this be a word of warning, particularly to those who still seem surprised or scandalized as though we have not performed our divine mission of master of the faithful. But as we have not neglected in the past and shall not neglect in the future to affirm, so now we repeat solemnly to all men of good will, in whatever land they may belong, that we most ardently desire and are striving to prove and fervently pray that God give us that peace which is joined with justice, truth, and charity.

"This is a sad Christmas," the Pope said in a Christmas allocution to the Sacred College of Cardinals, "obscured by dark and threatening clouds already tinted with human blood, while the future appears even more uncertain and ominous." While he prayed that God would dispel these menaces to the world, the Pope added, without actually mentioning the countries concerned, that other reasons for sorrow were the continuance of the anti-God campaign in Russia, the oppression of religion in Mexico and the fight against Christianity in the name of a new Christianity being waged in Germany. On the same day, the Pope issued an important encyclical to all Archbishops and Bishops dealing with problems of priesthood, inspired throughout by a lofty conception of the mission and duties of the clergy. "The office of the priest is not for the things human or for the things that pass away, however important and valuable these may seem, but for the things divine and enduring, the eternal things. . . . The priest must have a thorough and deep mass of sacred learning and in addition must be graced by not less knowledge and culture than is usual among the well-bred and well-educated people of his day."

During his Pontificate, Pius XI has created 103 dioceses and archdioceses; elevated 7 sees to archdioceses; established 19 abbeys and prelatures nullius. Known as "the Pope of the Missions," he has created 38 vicariates apostolic; elevated 46 prefectures, 20 of which he created, to vicariates; created 72 other prefectures apostolic and 24 missions and districts *sui iuris*. During 1935, he created 13 new dioceses, 2 new prelatures nullius, and 7 sees were elevated to archepiscopal rank. This is the first year during which the Pontiff elevated any diocese to an archdiocese. The Hierarchy is now composed of 7 suburbicarian sees, 10 residential and 4 titular Patriarchates, 214 residential archepiscopal sees; 911 residential episcopal sees (an increase of 6); 688 titular metropolitan, archepiscopal, and episcopal sees (an increase of 1); 266 vicariates (an increase of 10); 107 prefectures apostolic (an increase of 3); and 35 missions and districts *sui iuris* (a decrease of 1 due to elevation to higher rank.)

The 1935 report of the Sacred Roman Rota listed 96 marriage cases which had been submitted to this tribunal. Of these the validity of 42 marriages was upheld, 38 were declared null; and 16, which were heard on appeal, were upheld. Of the 96 cases, 63 were brought by those without funds; 33 by those with funds. Of the cases where nullity was declared 25 were those brought by the poor; 13 by those who paid court charges.

In the diplomatic field, activity has been uninterrupted. The visit of Premier Laval of France to His Holiness in March, the first from the French head of government since 1870, called attention to the new cordiality between France and the Holy See. This was further evidenced by the extraordinary state reception given Cardinal Pacelli, the Papal Secretary of State, when he went to France to preside as Papal Legate at the Triduum in

Lourdes. Another eloquent confirmation of these excellent relations with France and particularly with her Chief Executive, was the Pope's conferring the decoration of the Order of Christ on President Le Brun in the Vatican. In Spain there had been a decided rapprochement between the Holy See and the government. During Holy Week the traditional religious observances were held throughout the entire country for the first time since the overthrow of the monarchy. Due to the reported personal intervention of King Gustav, the Congregation of St. Bridget opened its first convent at Vadstena, Sweden. The order, founded in the 14th century by Sweden's patron Saint, Bridget, was suppressed with other religious orders by law in 1523. Although the law was not abrogated, the ban was dispensed in the case of these holy women. The situation of the Church in Mexico remains grave. Attempts of the present administration to socialize all education has met with the non-violent opposition of the clergy and laity; and numerous other oppressive measures have been variously enforced. At least in 14 of the 29 states, no priests are allowed to minister to millions of Catholics within their borders. Only 333 priests are allowed to serve 15,012,573 souls. Commentators, both Catholic and non-Catholic, see in the Government's course a pronounced policy of warring against any and all religions. Laymen organizations in the United States, publicly and officially, have urged the President and Congress to withdraw recognition of the present Mexican government or to take other appropriate steps. In Germany, the Nazi party has violated the Concordat signed by Reichchancellor Hitler. Action against Catholic youth organizations was intensified. Assembled at Fulda, the German Bishops wrote a pastoral letter, signed by 26 prelates, which was read to the faithful. They vigorously denounced the neo-paganism of certain Nazi leaders. As well, they attacked the shackling of the press, the nature of the sterilization and marriage laws, the activities of the Hitler *Jugend* and the attack upon denominational education. They also urged Catholics to "engage in no revolt and offer no resistance through violence." The arrest of many religious of both sexes, even of many high in the hierarchy, has made the situation more deplorable. The Holy See signed a Concordat with Yugoslavia, where conditions had been particularly bad since the kingdom's creation due to the hostile attitude of orthodox Serbs to Catholic Croats and Slovenes. The Concordat, recognizing these conditions, aims to correct them.

Assemblies. On April 26 began the Solemn Triduum at Lourdes which marked the end of the Holy Year; 400,000 pilgrims participated in the ceremonies presided over by the Papal Secretary of State, Eugenio Cardinal Pacelli, designated as Papal Legate. His Eminence was received with exceptional honors by the French government. Minister of State Louis Martin met him at Ventimiglia on the border, and a reception was held for him at Nice with 50,000 present. Four Cardinals and 80 prelates participated in the ceremonies at Lourdes where Mass was continuously celebrated morning and night for three days at the famous Grotto where the Blessed Virgin appeared to St. Bernadette Soubirous. Cardinal van Roey, Archbishop of Malines, presided at the first Solemn Pontifical Mass; Cardinal Binet, Archbishop of Besançon, the Mass on the second day; Most Rev. Luigi Maglione, Apostolic Nuncio to France, on the third; and the Papal Legate at the closing

Mass. Pope Pius XI addressed the gathering by radio, extended his blessings to the pilgrims and the world, and prayed that "we may finally enjoy the untroubled gifts of peace." Unusually impressive ceremonies and popular enthusiasm marked the Seventh National Eucharistic Congress held at Cleveland on September 24-26. Patrick Cardinal Hayes, Archbishop of New York, was the Papal Legate, the first American Cardinal to serve in that capacity. Over 400,000 were present from every State of the Union and practically every foreign country. The Cleveland celebration surpassed all other events of this kind in America. A special feature for the closing ceremonies was the formation by 20,000 people of a living monstrance at the centre of which the Papal Legate celebrated Benediction and gave the Papal Blessing to the assembled multitudes. The Pope, broadcasting to America, expressed his joy over the Congress' success. The First General Congress of Catholics of Czechoslovakia drew 350,000 visitors to Prague, July 15. Jean Cardinal Verdier, Archbishop of Paris, attended as Papal Legate and was received with honors accorded a visiting sovereign. Dr. Eduard Beneš, Foreign Minister, entertained the Legate at a dinner at which the Premier and other cabinet ministers, the diplomatic corps, and civic and ecclesiastical dignitaries were present. The First National Eucharistic Congress in Scotland was held in Edinburgh June 24-26.

The Cardinals. Francis Cardinal Bourne (q.v.), Archbishop and Metropolitan of Westminster and head of the Catholic Church in England, died January 1. The only English Cardinal since 1911, he was largely responsible for the great advance of the Church in England during the present century. Vatican circles as well gave him much credit for "formulating the ideas on which were based the negotiations" between Italy and the Holy See which resulted in the creation of Vatican City in 1929. Achille Cardinal Locatelli, titular Archbishop of Thessalonica, the first Cardinal to be created by the present Pontiff, died April 5. His Eminence was most active in the diplomatic field, having served as Papal Nuncio to Monaco, Brussels, Paris, and Vienna; and as Papal Internuncio to Argentina, Paraguay, and Uruguay. He also did important work as a member of the Congregations of Sacraments, Religious, Ceremonies, and Extraordinary Ecclesiastical Affairs. Pietro Cardinal LaFontaine, Patriarch of Venice, died July 9. Considered as a possible successor to Benedict XV, he was a member of the Congregations of Congresses and Sacraments. Paul Pierre Cardinal Andrieu, Archbishop of Bordeaux, died February 14. During the World War he took a deep interest in the welfare of American soldiers in the camps at that important debarkation port. Michele Cardinal Lega, Bishop of Frascati, died December 16. He became Dean of the Sacred Roman Rota in 1908 and at the time of his death was Prefect of the Congregation of Sacraments. Previously he had served as Papal Legate at Faenza, Ravenna, and Padua, and was appointed *sous doyen* of the Sacred College in 1931.

At a secret consistory on December 16 and a public one on December 19, the Pope created 20 new cardinals, one of the most important elevations numerically in the annals of the Church. From the lowest in many years, the Sacred College of Cardinals was thereby raised from 49 to 68, leaving two vacancies. This is the highest figure in history, for precedent once required three or four vacancies. The new Cardinals are: Most Rev. Carlo Salotti,

Secretary of the Congregation for the Propagation of the Faith; Most Rev. Luigi Copello, Archbishop of Buenos Aires; Msgr. Nicolas Canali, Assessor of the Congregation of the Holy Office; Msgr. Federico Tedeschini, Nuncio to Spain; Msgr. Luigi Maglione, Nuncio to France; Msgr. Emanuele Suhard, Archbishop of Rheims; Msgr. Enrico Baudrillart, President of the Catholic Institute of Paris; Msgr. Dominic Jorio, Secretary of Sacrament of the Roman Congregation; Msgr. Massimo Massimi, Dean of the Rota Tribunal; Msgr. Enrico Sibilila, Nuncio to Austria; Msgr. Francesco Mar-maggi, Nuncio to Poland; Most Rev. Isidoro y Tomas, Archbishop of Toledo; Most Rev. Carlo Kaspar, Archbishop of Prague; Msgr. Carlo Cremonse, Papal almsgiver; Msgr. Vincenzo la Puma, Assessor to the Holy Congregation; Msgr. Frederick Cattani Amadori, Secretary of the Apostolic Signatura; Msgr. Dominico Mariani, Treasurer of the Papal Ministries; Msgr. Ignazio Gabriele Tappouni, Patriarch of Antioch; Rev. Pietro Boetto, S.J., assistant to the General of the Society of Jesus.

The Hierarchy. Most Rev. Francis Hoowarts was appointed Vicar Apostolic to Tsaochowfu, Shantung, China, January 2; Most Rev. Edward J. Hanna, Archbishop of San Francisco, was made titular Archbishop of Gortyne, and Most Rev. John J. Mitty, Coadjutor Bishop of San Francisco, on March 8; Most Rev. Joseph Francis Rummel, Bishop of Omaha, was named Archbishop of New Orleans, March 18; Most Rev. Arthur Hinsley, titular Archbishop of Sardes, was named Archbishop of Westminster, April 4; Most Rev. Raymond Prendiville, titular Bishop of Cipsila, was made Archbishop of Perth, Australia, June 10; Most Rev. James H. Ryan, titular Bishop of Modra and Rector of Catholic University, was made Bishop of Omaha, August 6, Most Rev. Xavier Ritter was named Apostolic Nuncio to Prague, August 19, Most Rev. Ralph L. Hayes, Bishop of Helena, Mont., was appointed Rector of North American College, Rome, September 11; Count Preysing, Bishop of Eichstadt, was made Bishop of Berlin; Most Rev. Joseph C. Plagens, Auxiliary Bishop of Detroit, was named Bishop of Marquette, November 20; Most Rev. Gerald P. O'Hara, Auxiliary Bishop of Philadelphia, was named Bishop of Savannah to succeed Most Rev. Michael J. Keyes, who resigned because of ill health; Very Rev. Richard Pittini, S.C., was made Archbishop of Santo Domingo, November 2.

These new Bishops were appointed in 1935: Rt. Rev. Msgr. William R. Griffin, titular Bishop of Lidda and Auxiliary of LaCrosse, April 5; Rt. Rev. Charles Hanlon, C.P., Bishop of Catamarca, Argentina, April 21; Rt. Rev. Msgr. Henry Muehn, S.V.D., Bishop of newly-created diocese of Jujuay, Argentina, February 17; Rt. Rev. Msgr. Thomas H. McLaughlin, titular Bishop of Nisea and Auxiliary to Newark, May 20; Rt. Rev. Msgr. Francis Xavier Ford, titular Bishop of Etenna and Vicar Apostolic to Kaying, China, June 24; Rt. Rev. Msgr. Philip Cote, S.J., Vicar Apostolic to Suchow, China, July 6; Rt. Rev. Msgr. George L. Leech, Auxiliary to Harrisburg, July 12 and Bishop of Harrisburg, December 16; Rt. Rev. Msgr. Aloysius J. Muench, Bishop of Fargo, August 12; Rt. Rev. Msgr. Peter Leo Ireton, Coadjutor Bishop of Richmond, August 6; Rt. Rev. Michael McGrath, Bishop of Menevia, Wales, October 7; Rt. Rev. Msgr. Joseph M. Gilmore, Bishop of Helena, December 16; Rt. Rev. Msgr. Hugh L. Lamb, Auxiliary Bishop of Philadelphia, December 17.

These deaths occurred in 1935: Most Rev. Francis M. Redwood, Archbishop of Wellington, N. Z., January 2; Most Rev. John J. Monaghan, titular Bishop of Lidda and retired Bishop of Wilmington, January 8; Most Rev. José Bottaro, O.F.M., titular Archbishop of Macra and former Archbishop of Buenos Aires, June 1; Most Rev. Paul Joseph Nussbaum, C.P., Bishop of Marquette, June 23; Most Rev. Nikolaus Bares, Bishop of Berlin; Most Rev. Francis Marie Kersuzan, titular Archbishop of Sergiopolis and former Bishop of Cap Haitien, July 23; Most Rev. Peter Hurth, C.S.C., Titular Archbishop of Bosra, March 3; Most Rev. Philip R. McDevitt, Bishop of Harrisburg, November 11; Most Rev. Alphonse John Smith, Bishop of Nashville, December 16.

The Missions. The Society for the Propagation of the Faith received during 1934, \$3,600,000, an increase of \$1,200,000 over the preceding year. In the foreign missions fields there are 18,020 foreign and native priests, 8755 coadjutor brothers, 50,555 foreign and native sisters, 74,147 catechists, and 62,087 teachers. The Catholic population of China is 2,702,468, an increase of 78,908 over 1934. There are in China 89 Bishops, of whom 14 are natives; 2354 foreign and 1660 native priests; 1831 foreign and 3319 native sisters; 1148 brothers (more than half of whom are natives); and 3979 primary and secondary schools. 465,000 Chinese are under instruction for conversion. There are 250,747 Catholics in the Japanese empire; 350,000 in Oceania; 417,787 in the Dutch East Indies, 1,250,000 in Australasia. The Philippines number approximately 10,000,000 Catholics served by over 2000 priests, Guam, 15,800 served by 9 priests and Samoa, 1412 with 2 priests. There are 113,226 Catholics in Hawaii and 52 priests. In the Virgin Islands and Puerto Rico the Catholics are estimated at 1,600,000 with 279 priests; in Belize, 31,350 with 33 priests, and in Jamaica, 54,000 with 27 priests. There are 11,318 Catholics in Alaska, 5335 of whom are natives, 44 churches and 25 priests. In Africa there are almost 7,000,000 Catholics; in India, Burma, and Ceylon, 3,682,133; and in Malaya, 80,000.

Statistics. The total Catholic world population is approximately 350,000,000, or about 19 per cent of all. Figures compiled by the Official Catholic Directory for 1935 put the Catholic population of the United States proper at 20,523,053, an increase of 200,459. The number of converts was 63,845, or 14,664 more than in the previous year. The Hierarchy now numbers 18 Archbishops, 4 of whom are Cardinals, and 112 Bishops. The secular priests number 20,836, an increase of 381 over 1934, and the priests of religious orders number 9414, an increase of 250. The churches total 18,344, an increase of 100, and include 12,680 churches with resident pastors and 5664 missions with churches. The number of seminaries increased by 8, the total being 193; and the seminarians increased by 3114, the total being 23,579. There are 191 colleges for boys, an increase of 6. Colleges and academies for girls total 661, a decrease of 7. There are 1134 high schools, 106 more than in 1934, with a total attendance of 186,948, a gain of 4240. The number of parochial schools is 7422, a decrease of 7 from 1934, and an attendance of 2,209,673, a decrease of 15,080. The number of orphanages is 324, a decrease of 2, and the number of orphans cared for was 43,769, or 2505 less than in 1934. There are 155 homes for the aged poor, an increase of 8, and there are 659 hospitals with 412 nursing schools. Catholic chaplains attached to the U.S. Army number 31; to the U.S. Navy, 13; 20 in veteran hospitals; 16 auxiliaries; and 38 Military

ROWING. Rowing once more gained its high estate among college sports in 1935 and in both the long distance four-mile races and the shorter races there was unusually keen competition and the performances were of a high grade. The University of California eight-oared crew was the outstanding one of the year, winning the annual Poughkeepsie race for the third time in a row. The Golden Bears won in 1932 and then went on to Olympic conquests, won in 1934 when the Hudson event was renewed and in 1935 nipped

ROSICRUCIAN ORDER. An international fraternity, known as the Ancient, Mystic Order Rosæ Crucis, whose name is derived from the emblem, a cross with a single rose in its centre, adopted by Johann Valentin Andreæ, erroneously regarded as the restorer of the order in Germany in the 17th century. (For details as to the traditional origin and reestablishment of the order in North America, see the **NEW INTERNATIONAL YEAR BOOK**, 1932.) In 1935 the Rosicrucian Order in North America had throughout its jurisdiction of the United States and its dependencies, Canada, the West Indies, and the Central American states

Cornell in a grueling race that was close to a dead heat. Washington was third, with Navy, Syracuse, Pennsylvania, and Columbia trailing in that order. California also triumphed in the national intercollegiate sprint championship at Long Beach, Calif. later in June, finishing six feet ahead of Washington over the 2000 meter course. The other 4-mile race of the year, the annual Harvard-Yale regatta on the Thames at New London, was a procession with a superb Yale boatload leading Harvard by at least twelve lengths. Yale's oarsmen also captured the junior varsity and freshman events. As usual, Cambridge won the annual race from Putney to Mortlake from Oxford. Cambridge also won the coveted Grand Challenge Cup at Henley in July.

The preliminary season was dominated by Pennsylvania, superior over the short distances. The Pennsylvanians beat Yale and Columbia in the Blackwell Cup, Princeton and Columbia in the Childs Cup, and Navy and Harvard in the Adams Cup. The Carnegie Cup regatta was blown away by high winds on Lake Cayuga. Rowing continued to grow and in early June the beginners staged a regatta at Marietta, O., with crews from Marietta, Rutgers, Pennsylvania, Manhattan, Wisconsin, and Rollins competing. Rutgers won the varsity race. The New York Athletic Club eight was the outstanding club crew of the season, winning the national championship at Princeton. The national sculling title went to a Canadian, Charles Campbell of the Toronto Argonauts. L. Ruffli, a Swiss sculler, won the Diamond Sculls at Henley and the world's professional sculling title was again taken by powerful Bob Pearce, the Australian who lives in Toronto. Bill Miller of Philadelphia was his closest rival.

RUANDA-URUNDI, rū-ān'da ōō-rōōn'dē. Two districts (formerly in German East Africa) mandated to Belgium by the League of Nations, and united for administrative purposes with the Belgian Congo in 1925. Area, 20,535 sq. miles, population, 3,035,130 including 803 Europeans. Capital, Usumbura.

The principal occupation of the country was the raising of livestock. In 1934, imports were valued at \$800,000; exports, \$400,000 (amounts are based on old U.S. gold dollar, of 1.50463 gram fine gold). For 1934, the estimated total revenue was 42,328,900 francs; estimated total expenditure, 40,513,800 francs (5 paper francs were equal to 1 belga which averaged \$0.2329 for 1934). The public debt on Jan 1, 1934, was 145,500,000 francs. According to the law of Aug. 21, 1925, both districts were united, for administrative reasons, with the Belgian Congo and placed under the supervision of a vice-governor.

RUBBER. The rubber industry of the United States continued its growth during 1935 to a new all-time high, according to *India Rubber World*, New York. The consumption of crude rubber was 6 per cent above the previous banner year of 1929 and more than three times as great as in 1917. According to the Leather and Rubber Division of the U.S. Department of Commerce, consumption in the United States totaled 505,160 long tons. In 1934 the consumption was 463,676 long tons. World absorption for the year amounted to 956,428 long tons as against 931,943 long tons in 1934.

The basic quotas of production signed by the representatives of the leading producing countries in 1934 were found, after 18 months of trial, to

work a grievous hardship upon natives of the Netherland East Indies. As a result, the International Rubber Regulation Committee after careful consideration, recommended on December 3 to the several signatory governments that the basic quotas allotted to the Netherland East Indies be revised to permit 1936 production to rise from 443,000 tons to 500,000 tons, 1937 from 467,000 tons to 520,000 tons, and 1938 from 485,000 to 540,000 tons.

From preliminary reports furnished by the U.S. Department of Commerce, the shipments of crude rubber in 1935 from all parts of the world are shown in the accompanying table.

WORLD RUBBER SHIPMENTS, 1935
[Long tons]

British Malaya	415,667
Brunei and Labuan	1,228
Ceylon	54,316

In the consumption of rubber, the United Kingdom retained second position with 99,556 long tons, a drop of about 10,000 tons from 1934. Japan also showed a similar decline, from 69,905 tons in 1934 to 57,565 tons. Consequently, Germany rose to the third consuming nation with 62,899 long tons (59,330 in 1934). The rubber absorption of these and other nations in 1935, as furnished by the U.S. Department of Commerce, is shown in the accompanying table.

The production and shipment of pneumatic casings, tubes, and solid tires in the United States during 1935, compiled by the Rubber Manufacturers Association, and covering approximately 97 per cent of the industry, as compared with a similar record for 1934, is shown on page 648.

The rubber consumption in tires and tire sundries in 1935 totaled 325,280 long tons, or exactly 6000 tons less than in 1934. The sales value of the finished products, however, rose to \$339,562,000 as against \$317,996,000 in 1934.

Again in 1935 the consumption of rubber in the United States exceeded the consumption in the previous year in the manufacture of products other than tires, as reported by the same statistical bureau. These lines, detailed in the following table, consumed 95,565 long tons, as compared with 89,309 long tons in 1934, and the sales value of the manufactured products totaled \$214,600,000 as compared with \$202,483,000 in 1934.

CRUDE RUBBER CONSUMED IN OTHER RUBBER PRODUCTS IN THE U.S. (LONG TONS)

RUMANIA. A constitutional monarchy of southeastern Europe. Capital, Bucharest. Reigning sovereign in 1935, Carol II.

Area and Population. With an area of 113,887 square miles, Rumania had an estimated population on Jan. 1, 1934, of 18,791,637 (1930 census, 18,057,074). Living births in 1933 numbered 597,621; deaths, 348,085; marriages, 155,049. Populations of the chief cities in 1930 were: Bucharest (Bucuresti), 631,288; Chisinau (Kishinev), 117,016; Cernauti (Czernowitz), 111,147; Iasi (Jassy), 102,595; Galati, 101,148; Cluj (Klausenburg), 98,569; Timisoara, 91,866; Oradea-Mare (Grosswardein), 82,355; Ploesti, 77,325; Arad, 77,225. The religious division of the population in 1934 was: Orthodox, 13,300,000; Greek Catholics, 1,800,000; Roman Catholics, 1,200,000; Reformists, 720,000; Lutherans, 400,000; Unitarians, 75,000; Jews, 900,000; Moslems, 260,000.

Education. Primary education is nominally free and compulsory but a large percentage of the population is illiterate. School attendance in 1931-32 was: Elementary, 1,795,037; secondary, 145,580; university, 35,980. There are universities at Bucharest, Iasi, Cluj, and Cernauti.

Production. Three-fourths of the people are engaged in agriculture. In 1934 33,154,000 acres (45 per cent of the total) was suitable for cultivation, 9,615,000 acres were under pasture, 1,390,000 acres devoted to trees and shrubs, and 15,934,000 acres were forest land. Yields of the chief crops in 1934 were (in thousands of units): Wheat, 76,553 bu.; rye, 8308 bu.; barley, 40,021 bu.; oats, 38,806 bu.; corn, 188,969 bu.; potatoes, 70,610 bu.; sugar beets, 650 metric tons; beet sugar (1934-35), 118 metric tons; wine, 213,978 gal. In 1932 there

were 4,187,000 cattle, 12,317,000 sheep, 2,965,000 swine, 421,000 goats, 2,031,000 horses, mules and asses, and 195,000 buffaloes.

Mineral production in 1934 was (in 1000 metric tons): Coal, 277; lignite, 1611; petroleum, 8467. In 1933 the output of other minerals was: Natural gas, 52,968,000,000 cu. ft.; salt, 612,892,000 lb.; iron ore, 13,831 metric tons, gold, 142,585 troy oz.; silver, 353,489 troy oz.; pig iron, 2024 metric tons, copper, 453,205 lb. In 1932 there were 3524 industrial establishments employing 132,389 laborers and 19,920 technical and administrative employees. Flour milling, brewing, and distilling were the most important lines.

Foreign Trade. Imports for consumption in 1934 were valued at 13,095,971,000 lei (11,592,204,000 in 1933) and exports at 13,612,988,000 lei (14,101,342,000 in 1933). Leading imports in 1934 (in 1000 gold dollars) were: Vegetable textiles and derivatives, 22,016; iron and iron products, 11,648; apparatus, machinery, and motors, 8253; wool, hairs, and articles thereof, 6678; chemical products and medicines, 3513; fruits and colonial products, 3003. The chief exports were (in 1000 gold dollars): Coal, lignite, petroleum, and derivatives, 43,000; cereals and their products, 14,180; wood and derivatives, 8723; live animals, 3745; plant seeds, 3733; animal foodstuffs, 2323. Of the 1934 imports the United Kingdom supplied 16.2 per cent; Germany, 15.5; France, 11.2; Austria, 10; Czechoslovakia, 9.9; Italy, 7.3. Germany took 16.6 per cent of the exports; United Kingdom, 10; France, 9.7, Austria, 9; Italy, 7.8.

Imports in 1935 totaled 10,611,600,000 lei; exports, 16,650,000,000 lei. Imports from the United States were \$2,985,423; exports to the United States, \$1,097,992.

Finance. Preliminary budget returns for the fiscal year ended Mar. 31, 1935, showed receipts of 18,809,300,000 lei and expenditures of 19,845,100,000 lei. This compared with 1933-34 receipts of 18,364,000,000 and expenditures of 20,361,000,000 lei. The public debt as of Mar. 31, 1935, was estimated at 99,700,000,000 lei (internal, 19,300,000,000, external, 80,400,000,000). The leu (par value, \$0.0101 in 1935) exchanged at an average of \$0.00597 in 1932, \$0.0078 in 1933, \$0.01001 in 1934, and \$0.0093 in 1935.

Communications. Rumania in 1934 had 6965 miles of state-owned railway lines, 79,176 miles of highways; and air lines connecting Bucharest with the other European capitals. The railways in 1934 carried 27,232,000 passengers and 19,332,000 metric tons of freight, earning gross receipts of 8,217,000,000 lei. The net tonnage of vessels with cargo and in ballast entering Rumanian ports in the overseas trade in 1934 was 6,937,000 (7,817,000 in 1933).

Government. The constitution of Mar. 28, 1923, vested executive power in the King and a council of ministers, the King having a suspensive veto over laws passed by parliament. Legislative power rested in a parliament of two chambers—a chamber of deputies, with 387 elected members, and a senate of 200 elected and about 50 *ex officio* and appointed members. The term of elected deputies and senators was four years. Prenner at the beginning of 1935, George Tatarescu, appointed Oct. 4, 1934.

History. Domestic Affairs. The course of domestic politics ran relatively smoothly during 1935. Premier George Tatarescu's National Liberal Ministry remained in office throughout the year without facing a serious threat to its power. Some significant trends became apparent among

the political parties, but produced no immediate repercussions in governmental affairs. Early in the year the People's party led by Gen. Alexander Averescu and the Liberal faction under George Bratianu which seceded from the National Liberals in 1930 united in opposition to the government and to King Carol's personal rule. The powerful National Peasant party underwent a reorganization in which former Premier Julius Maniu and his adherents were apparently relegated to a less influential position. Later in the year former Premier Vaida-Voevod and a small group of followers withdrew from the National Peasant party and formed a separate organization. Another change was the absorption of Professor Cuza's violently anti-Semitic National Christian Defence League into the Agrarian party led by O. Goga, and the merging of Vaida-Voevod's group with them on November 30. The Rumanian National Fascist party was reported to have gained ground rapidly during the year. Clashes between the police and Fascists occurred in Bucharest with increasing frequency.

As in previous years since Carol's return to the throne, the major cause of political unrest was the dominance at court of a camarilla headed by Mme. Magda Lupescu, the Jewish mistress of the King. The National Peasant party in particular continued its efforts to drive Mme. Lupescu from Rumania. At a nation-wide party rally in Brasov on June 17 Dr. Maniu warned the King that his refusal to part with his mistress directly endangered his throne. At this and other meetings, Mme. Lupescu was charged with responsibility for the continued censorship, the martial law in effect in numerous cities, and the strangle hold of the palace clique upon national affairs and government positions. Her brother, Jorgu Mileteanu, was head of the state health and insurance organization and it was charged that numerous other relatives and a disproportionate number of Jews had obtained government posts. The attacks by the National Peasants were seconded by General Averescu and George Bratianu and their adherents, but without making any noticeable impression upon Carol.

A new scandal arose in Bucharest during the year over revelations of wholesale fraud and corruption in connection with rearmament contracts awarded the French-controlled Skoda armament firm. A report issued by a parliamentary commission following an investigation indicated that exorbitant prices were paid for the arms procured, that large sums were diverted to Rumanian officials, and that incriminating documents had been hidden or destroyed by highly placed members of the government. The Chamber of Deputies on March 27 approved a resolution for the indictment of two former Ministers—General Cihosky and Mihai Popovici, former Minister of Justice.

Economic Developments. The economic situation went from bad to worse during 1935. The small favorable trade balance made it increasingly difficult during the first months of the year to meet debt and other payments abroad. The increase in the cost of living and the large budget deficit led to demands for inflation from many quarters. In the spring the Finance Minister was granted additional power to control foreign trade through the restriction of imports and the encouragement of exports. Late in May a new system of exchange regulations and trade control was announced with these ends in view, effective June 11. The National Bank assumed strict con-

trol of all foreign exchange transactions and funds for the subsidization of exports were raised by collecting import premiums or taxes on exchange released to importers to pay for goods entering the country. Imports were continued on a quota basis, subject to permits issued by the Ministry of Industry and Commerce.

During June and July settlement of obligations abroad almost ceased. The National Bank released very little foreign exchange to pay for imports and practically none at all to pay creditors in the United States. Imports from the United States, Japan, Norway, and Latvia, which normally sold Rumania much more than they purchased from her, were drastically curtailed. Even those countries buying more from Rumania than they sold to her had difficulty collecting payments for goods and securing the servicing of Rumanian bonds. Great Britain in February reached an agreement with the Rumanian Government for the progressive liquidation of outstanding Rumanian trade debts to British merchants, which aggregated £2,500,000 on Nov. 1, 1934. In August Rumania agreed to set aside 30 per cent of her surplus foreign exchange arising from Anglo-Rumanian trade for payment of interest on British-owned Rumanian bonds. In October, however, Rumania defaulted on the current service of her debt to British bondholders. Nevertheless, as a result of the new foreign trade controls, the excess of exports over imports mounted to approximately 6,038,400,000 lei in 1935 from 447,600,000 lei in 1934. For Rumania's default on war debts to the United States, see REPARATIONS AND WAR DEBTS.

Foreign Relations. As a member of both the Balkan Entente (q.v.) and the Little Entente (q.v.), Rumania followed the same general foreign policy during 1935 as the other associated States. The major aim of both these combinations was to preserve the territorial gains won during the World War. In 1935 this aim was menaced more directly than ever before by the revival of German military power and the growing danger that Hungary and possibly Poland and Bulgaria would join forces with the Reich in overthrowing the peace treaties. To counter-balance the growing power of Germany, the Little Entente and Balkan States turned to ever closer collaboration with the Soviet Union. Czechoslovakia concluded a mutual assistance pact with Moscow, which received the approval of both Rumania and Yugoslavia before it was signed. Negotiations for a similar pact between Rumania and the U.S.S.R. were reported to be practically completed by the end of 1935. The importance of this treaty was that it would doubtless enable Soviet troops and aeroplanes to pass over Rumanian territory to go to the defense of Czechoslovakia in case of a German attack upon the latter republic.

The Soviet Government sought to further the friendly associations inaugurated with the restoration of Rumanian-Russian diplomatic relations on June 9, 1934. In June, 1935, the Moscow authorities returned to Rumania the Rumanian treasures and archives which had been sent to Russia for safekeeping during the World War. In October the Soviet Government reiterated its pledge to abandon its claim to Bessarabia, former Russian territory incorporated in Rumania after the World War. Opposition to a pro-Soviet foreign policy continued in certain influential Rumanian circles, however. Persistent Communist agitation did nothing to calm these apprehensions. In May the Rumanian police arrested 50 alleged Communists

and seized two printing establishments, containing much propagandist literature. Fascist organizations in Rumania were openly urging an alliance with Germany and the complete repudiation of the system of alliances built up since the World War.

The concentration of Bulgarian troops along the Greek border during the Greek civil war of March, 1935, led Foreign Minister Titulescu of Rumania to join with Turkey in warning Bulgaria against any interference in Greek affairs. In July the Rumanian Foreign Minister again took the lead, following the abrogation of the anti-Hapsburg laws in Austria, in warning the Austrian Government that restoration of the Hapsburg dynasty would mean mobilization of the Little Entente armies. Prince Paul, chief regent of Yugoslavia, visited King Carol on July 12-13, 1935, and was reported to have discussed with the King and Foreign Minister Titulescu the policy to be followed with respect to the Russo-Czechoslovak pact and the prospective restoration of the Hapsburgs. With the outbreak of the European crisis over Ethiopia in September and October, Rumania joined with the Little Entente and Balkan Entente in supporting the application of League sanctions against Italy and in promising military support to Great Britain in case of an Italian attack upon the British fleet in the Mediterranean. Meanwhile the rearmament of Rumania was pushed forward as rapidly as possible, despite the precarious condition of the country's finances.

RUSSELL, GEORGE WILLIAM ("AE"). An Irish poet and economist, died at Bournemouth, England, July 17, 1935. Born in Lurgan, County Armagh, Ireland, Apr. 10, 1867, he attended Rathmines School in Dublin and then entered an accountant's office, when for a time he contributed to and edited a privately published monthly called *The Theosophist*. At this time he adopted the signature "AE," which was due to the difficulty on the part of the printer in reading the word "aeon," which he had affixed to one of his poems. At first it was his intention to use this only in connection with his literary works, but later he used it to sign all his work.

The agricultural situation of his country soon engaged his interest, and in 1897, through his friendship with W. B. Yeats, he joined Sir Horace Plunkett's Irish Agricultural Organization. He soon became indispensable as an organizer and orator, and in 1904 was appointed editor of *The Irish Homestead*, the organ of the agricultural movement. In 1923 when the magazine merged with *The Irish Statesman*, he became its editor, and served until 1930 when the publication went out of existence. During 1917-18 he was a member of the Irish Convention. In connection with the coöperative movement in Ireland, he wrote several pamphlets, the chief being *Coöperation and Nationality* (1912) and *The Rural Community* (1913), which were developed more fully in *The National Being; Thoughts on an Irish Policy* (1917).

His first poetical work, *Homeward; Songs by the Way* appeared in 1894 and his next, *The Earth Breath* in 1897. He himself in the "Preface" to *Collected Poems* (1913) gives an account of his work when he says, "When I first discovered

for myself how near was the King in His beauty, I thought I would be the singer of the happiest songs. . . . I have found it easier to read the mystery told in tears and understood Thee better in sorrow than in joy . . ." (by permission of The Macmillan Company, publishers). Himself by nature a mystic, it was inevitable that his work would be influenced by the legend and folklore of his native land.

His works were not devoted solely to poetry. In collaboration he wrote *Literary Ideals in Ireland* (1899) and *Ideals in Ireland* (1901). His three act drama in prose, *Deirdre* (1907), was produced by the Abbey Theatre, Dublin, of which he was one of the founders. Other of his non-poetical works include *The Mask of Apollo* (1904), a collection of tales; *Irish Essays* (1906); *Imaginations and Reveries* (1915); *The Avatars* (1933), a futurist fantasy. Representative of his poetical work are *The Divine Vision* (1904); *New Poems* (1904); *By Still Waters* (1906); *Collected Poems* (1913); *The Candle of Vision* (1919); *Midsummer Eve* (1928); *Dark Weeping* (1929); *Vale and Other Poems* (1931); *Song and Its Fountains* (1932); *House of the Titans and Other Poems* (1934); *Selected Poems* (1935). With his death, one of the last of the founders of the Celtic twilight cult of Irish literature is gone.

RUSSELL SAGE FOUNDATION. The Russell Sage Foundation was created by Mrs. Russell Sage in 1907, very shortly after the death of her husband, for whom she desired to create a memorial. As set forth in its charter, the Foundation was organized "for the purpose of receiving and maintaining a fund, or funds, and applying the income thereof to the improvement of social and living conditions in the United States of America." The original memorial fund amounted to \$10,000,000, which was increased by the sum of \$5,000,000 left by Mrs. Sage in her will.

The Foundation not only endeavors to avoid duplicating work already being done by other agencies, but frequently turns over to subsequently set up organizations activities which it has been instrumental in organizing, when it believes that such transfer will work to the greater advancement of that particular type of work. Under this policy it has from time to time encouraged several of its departments to become independent units, and it has filled such vacancies with other departments or activities in fields which at the time seemed to be neglected.

Its departments are largely engaged in various types of research pertaining fundamentally to the aim of the Foundation to better social and living conditions, and in making the results of such study and its interpretation available to others. The information thus obtained is communicated to the public, and particularly to those to whom it will be most serviceable, through publications, lectures, addresses, courses of instruction, conferences, and such various other methods as will most contribute to the advancement of knowledge in the welfare field and best stimulate public and private action for social betterment.

The departmental work of the Foundation is in normal times classified chiefly under the heads of family welfare and charity organization, industrial relations, handicrafts, library on social work and social conditions and problems, recreation and community centres, remedial loans and consumers credit, social statistics, social service and relief, social surveys, social work interpretation, social work year book, publications, a limited service on

matters concerning delinquency and penology, and general administration.

During the emergency period of the last few years a great deal of the normal work of the Foundation staff has been suspended and attention centred upon the study and solution of problems brought on by unemployment and its attendant depression. These emergency activities have been concerned with such matters as the collection, study and communication to the public of information as to outstanding pieces of work in organizing and administering relief; the study and evaluation of various State emergency relief administrations; assistance personally and by publication, in planning educational campaigns to interest and inform the public regarding the needs of the unemployed and methods of cooperation in helping them; the study of the relation of workers organizations to management, especially as affected by governmental action; improvement of public statistics relating to employment; the systematic collection of statistics of relief work in the United States; experimental studies in cities on the amount and distribution of unemployment, in an effort to develop more effective survey methods for use in other similar localities; the study of consumer debt in its relation to the depression borrower; in acting as a centre of information and guidance on recreational studies and projects developed for the utilization of leisure time; and in encouraging all efforts to direct the activities of those with enforced spare time into wholesome and educational channels. This past year the Foundation devoted approximately half of its income in support of other agencies in similar fields.

The trustees and officers of the Foundation are as follows: Lawson Purdy, vice-president and treasurer; John M. Glenn, secretary; Lindsay Bradford, Joseph P. Chamberlain, Johnston de Forest, Frederic A. Delano, John H. Finley, Morris Hadley, Mrs. Frederic S. Lee, Mrs. Finley J. Shepard, and Harold T. White. Shelby M. Harrison is general director. Offices are maintained at 130 East 22d Street, New York City.

RUSSIAN SOCIALIST FEDERATED SOVIET REPUBLICS. See UNION OF SOVIET SOCIALIST REPUBLICS

RUTGERS UNIVERSITY. A nonsectarian institution of higher learning in New Brunswick, N. J., founded under the name of Queen's College in 1766. The university consists of the following schools and colleges: Arts and sciences, engineering, agriculture, pharmacy, chemistry, education, New Jersey College for Women, and University College. The registration for the autumn of 1935 was 2550, of whom 964 were enrolled in the college for women. Of the 299 members of the faculty 182 were professors and 117 instructors. The endowment funds amounted to \$4,271,524, and the income for the year, exclusive of the State agricultural experiment station, was \$2,630,516. The library contained 200,000 volumes. President, Robert C. Clothier, LL.D.

RUTHENIA. See CZECHOSLOVAKIA.

RYE. The 1935 rye crop of 26 countries reporting to the International Institute of Agriculture, not including the Soviet Republics and the countries of the southern hemisphere, was estimated at 934,735,000 bu. which was 2.8 per cent above their production in 1934 and 2.4 per cent below the average for the five years 1929-33. The acreage of these countries, 45,587,000 acres, was 5.1 per cent above the area in 1934 and .2 per cent above the average for the five-year period. The production

of the leading countries other than the United States was estimated as follows: Germany 297,-362,000 bu., Poland 251,246,000 bu., Czechoslovakia 64,502,000 bu., and France 29,981,000 bu. The Soviet Republics reported a yield of 792,488,000 bu. in 1934 and Argentina, the leading rye producing country of South America, a yield of 15,787,000 bu. in the crop-year 1934-35.

According to the Department of Agriculture the 1935 production of 57,936,000 bu. in the United States was the largest rye crop the country produced since 1924. This crop was about 42,000,000 bu. above the crop of 16,045,000 bu. in 1934. The 1935 acreage of 4,063,000 acres compared with 1,942,000 acres the year before. The area harvested in 1935 was increased in all North Central States, especially in Minnesota, the Dakotas, and Nebraska. The 1935 yields per acre were above average in all main rye producing States, the yields per acre for the entire country being 14.3 bu. compared with 8.3 bu. in 1934 and 12.2 bu., the average for the 10 years 1923-32. The average farm price for the early part of the 1935 marketing season was 38.4 cents per bu. compared with 71.3 cents for the marketing season of 1934. At these prices the total value of the 1935 crop was \$22,248,000 and of the 1934 crop \$11,445,000. The yields of the leading States were reported as follows: North Dakota 12,754,000 bu., Minnesota 9,900,000 bu., Nebraska 7,250,000 bu., and South Dakota 7,050,000 bu. Exports of rye from the U.S.A. in the fiscal year ended June 30, 1935, were negligible in quantity and the imports amounted to 5,864,000 bu.

SAAR. A part of the German Rhineland, the administration of which was transferred to the League of Nations for 15 years by the Treaty of Versailles. By the same treaty the Saar coal mines were ceded outright to France as compensation for war damages. With an area of 738 square miles and a population of 828,128 (1934), the Saar comprised one of the most important coal and steel producing regions of Europe. The 1934 output, in 1000 metric tons, was: Coal, 11,316; pig iron, 1824; steel ingots and castings, 1944.

The Saar was governed from 1920 to Mar. 1, 1935, by a commission of five members appointed for one year by the Council of the League of Nations. After extensive preparations during 1934 (see the NEW INTERNATIONAL YEAR BOOK for 1934, p. 635-636), the plebiscite called for by the Treaty of Versailles to determine the future of the Saar was held on Jan. 13, 1935. Out of 525,756 valid votes, 477,119 favored reincorporation in Germany, 46,513 continuation of the League régime, and 2124 annexation to France. Despite the extreme tension generated by the campaign, the voting was orderly and freedom of the ballot was insured by the Plebiscite Commission's elaborate precautions, supported by an international army of 3300 British, Italian, and Swedish troops.

Following Germany's overwhelming victory, the League Council on January 17 awarded the entire territory to the Reich and the transfer took place on March 1 amid the delirious rejoicing of the Saar population. The crisis in Franco-German relations produced by the Saar question in 1934 was thus peacefully liquidated. Meanwhile some 10,000 Saar Communists, Jews, and Catholics fled to France to escape Nazi vengeance for their anti-Nazi activities during the plebiscite campaign. The transfer of mines, railways, customs houses, state properties, etc., took place in accordance with an agreement

reached between German, French, and League representatives at Naples on February 18. Upon the insistence of France, the Reich agreed to demilitarization of the territory.

Administration of the territory was taken over by Joseph Buerckel, whom Chancellor Hitler appointed Reich Commissioner for the Saar. To prevent a violent disturbance of the Saar's economic life, Herr Buerckel temporarily restricted trade between the Saar and the rest of Germany in food and certain other commodities while arranging for increased German purchases of Saar coal. Despite these precautions the cost of living in the Saar showed a substantial increase under German rule, producing some discontent among the Saarlanders. See *GERMANY under History*.

SAGHALIEN. See **SAKHALIN**; **KARAFUTO**.

ST. CHRISTOPHER-NEVIS. See **LEEWARD ISLANDS**.

ST. HELENA. A British colony in the South Atlantic, consisting of the island of St. Helena (47 sq. m.) and its dependency the island of Ascension (34 sq. m.). Population (Jan. 1, 1935), 4412 (of whom 173 were on Ascension) compared with 4183 (1931 census). Jamestown, the capital, had 1381 inhabitants in 1931. The production of hemp fibre was the chief industry. In 1934, total imports were valued at £33,476; total exports, £8949; revenue (including a £2500 grant from the British Treasury), £24,474; expenditure, £23,792; public debt, nil. The colony was administered by a governor, assisted by an executive council. Governor, Sir S. S. Davis.

ST. JOHN'S COLLEGE. A college of liberal arts and sciences for men in Annapolis, Md., founded as King William's School in 1696. The enrollment for the first half-year of 1935-36 was 269. There are 26 faculty members. The endowment fund as of June 30, 1935, amounted to \$211,579.68, and the income for the year was \$244,600. The library contained 30,011 volumes. President, Amos W. W. Woodcock, LL.D.

ST. LAWRENCE UNIVERSITY. An institution for the higher education of men and women at Canton, N. Y., founded in 1856. The registration for the autumn term of 1935 was 681. For the Summer session of 1935, 210. The faculty numbered 54 members. The endowment funds amounted to \$5,059,453, and the income for the year was \$225,908. The law school of the University is located in Brooklyn, N. Y. Its enrollment for the autumn term of 1935 was 1155. The library contained approximately 63,000 volumes. President, Laurens Hickok Seelye, M.A., LL.D.

ST. LOUIS. See **MUSIC**.

ST. LUCIA. A British colony in the Windward Islands group of the British West Indies. Area, 233 sq. miles; population (Jan. 1, 1935), 63,800. Port Castries, the capital, was an important coaling station and 314 steamships (aggregating 896,828 tons) entered the harbor in 1934. Sugar, limes, rum, cacao, copra, and logwood were the main products. In 1934, imports were valued at £169,439; exports, £133,986; revenue, £85,079; expenditure, £90,953; public debt, £120,366. St. Lucia was under the governor of the Windward Islands but it had its own legislative council. See **WINDWARD ISLANDS**.

ST. PIERRE AND MIQUELON (mīk'ē-lōn'). The main islands in two small groups, near the south shore of Newfoundland, owned by France. Area of St. Pierre group, 10 sq. miles; Miquelon group, 83 sq. miles. Total population (1931), 4321. Capital, St. Pierre. Cod fishing was

the principal industry. In 1933, imports were valued at 115,000,000 francs; exports, 138,000,000 francs. The budget for 1934 was balanced at 8,370,260 francs (franc averaged \$0.0657 for 1934; \$0.0501 for 1933). In October, 1935, the islands were granted a greater measure of autonomy, including control of local affairs by an elected council of 12.

ST. THOMAS. See **SÃO THOMÉ AND PRINCE**; **VIRGIN ISLANDS**.

ST. VINCENT. A British island colony in the Windward Islands group of the West Indies. Area, 150.3 sq. miles; population (1934 estimate), 53,622 compared with 47,961 (1931 census). Kingstown, the capital, had 4269 inhabitants in 1931. In 1934 the 37 primary schools had 9413 pupils enrolled; the 2 secondary schools had 147 pupils enrolled.

Production and Trade. Arrowroot, coconuts, cotton, sweet potatoes, cassava, plantains, sirup, and sugar were the main products. The 1934 estimated production of arrowroot amounted to 3432 short tons valued at £78,000. An area of 230 acres planted with bananas during 1934 was expected to be producing during 1935. In 1934, total imports were valued at £163,035; total exports, £135,229.

Government. For 1934, revenue amounted to £77,819; expenditure, £73,761; public debt, £91,923 against which the sinking funds totaled £7477. St. Vincent was under the Governor of the Windward Islands but had its own executive and legislative councils. The islands of the Lesser Grenadines (Mayreau, Canouan, Union Island, Mustique, and Bequia) were administered from St. Vincent. See **WINDWARD ISLANDS**.

History. On Oct. 21, 1935, rioting broke out at Kingstown after a mass demonstration of striking Negro laborers. The Riot Act was read and the police were compelled to open fire on the rioters when they attacked the police, looted stores and houses, and destroyed highways. Three rioters were killed. The injured included the chief of police, the prison warden, six policemen, and over 20 rioters. Order was restored on October 23 with the aid of armed sailors landed from the British warship *Challenger* but the town was continued under martial law. An anti-rioting law passed by the legislative council became law on Nov. 16, 1935. Violators were made liable to a \$5000 fine and two years in jail, and the police were given power to enter buildings under warrant to search for prohibited publications.

SAKDALISTS. See **PHILIPPINES** under *History*.

SAKHALIN, sa'ka-lēn'. An island off the east coast of Siberia. The area north of 50° N. is a district of the Far Eastern Area of the U.S.S.R. Area, 14,663 sq. miles; population, 39,400. Capital, Aleksandrovsk-Sakhalinski (8100 inhabitants). Fish, oil, and lumber were the principal products. For the Japanese part of the island see **KARAFUTO**.

SALAMANCA, DANIEL. A Bolivian statesman, died at La Paz, Bolivia, July 17, 1935. He was born at Cochabamba, July 8, 1869, and was educated at the University of San Simeon in his native town. While still a student, he became the University secretary, and subsequently taught political economy, finance, and statistics there.

His first entry into public life was made in 1900 when he was elected a National Deputy. Three years later he was appointed Minister of Finance and Industry in the cabinet of President Pando, and in the following year led an unsuccessful fight in the Senate against the ratification of the treaty with Chile, whereby Bolivia lost its strip of the Pacific

Coast. Also, he was a member of the opposition to the foreign railroad building concession in 1906 and was again unsuccessful. The year 1910 saw him in Europe and the United States on financial missions.

In 1914, Salamanca sponsored a new party, the Union Republicans, but inasmuch as President Montes declared martial law, its formation was prevented. However, it subsequently came into existence and out of it grew the revolution of 1920 which put Bautista Saavedra in the presidential chair. Party politics and ill health now caused Salamanca to resign his senatorship, and from 1924 to 1930 he taught at his old University until the coup of the rebel forces on June 19 of the latter year led him to the presidency.

In January, 1931, he was elected president of Bolivia and from the start his régime was faced with overwhelming financial difficulties, and the revival of party and regional dispute. Notwithstanding these difficulties, the first part of his administration enhanced his reputation for integrity and ability. Less than 17 months after he had taken over the Government, the Paraguay-Bolivia War broke out, and he recalled Hans Kundt, the German trainer of Bolivian forces, from exile to command the troops. By 1932 conditions were such that Salamanca offered to delegate his powers to a Coalition Government, but the various factions, not wishing to be held responsible for the outcome of the War, could not agree. By 1934, however, dissatisfaction with his conduct of the war and his efforts to finance the war without asking any outside assistance, as well as the condition of his health, led him to resign on November 27. He retired to Cochabamba and began his memoirs and a history of the Chaco War.

SALVADOR, EL (ĕl sal'va-dōr'). A republic of Central America. Capital, San Salvador.

Area and Population. The smallest and most densely populated of the Central American states, El Salvador has an area of 13,176 square miles and a population estimated on Dec. 31, 1934, at 1,574,000 (1,459,578 at the 1930 census). The bulk of the population consists of Indians and persons of mixed Spanish and Indian blood, but the small governing and educated class is largely of Spanish descent. Living births in 1934 numbered 62,727; deaths, 38,216. Populations of the chief towns in 1932 were: San Salvador, 98,555; Santa Ana, 78,321; San Miguel, 41,453; Ahuachapán, 29,520; San Vicente, 26,131. Roman Catholicism is the dominant religion.

Education. Elementary education is free and compulsory. In 1934 there were 63,284 pupils in 968 primary schools, of which 56,373 attended government schools, 1694 private schools, and 5217 municipal schools. A new three-year curriculum was introduced in the 388 rural schools in September, 1934. Secondary schools numbered 31, of which 22 offered academic and 9 commercial subjects. There were 2 normal schools and the National University (with about 500 students).

Production. About 60 per cent of the total area is under cultivation. Coffee is the chief money crop, accounting for 96 per cent of the value of all exports in 1933. The 1934-35 coffee crop was about 825,000 bags (of 152 lb.), of which 730,907 bags were shipped abroad. Henequen and sugar are the other export crops, while corn, beans, and rice are grown extensively for local consumption. Livestock in 1933 included 523,000 cattle, 358,000 swine, and 150,000 horses, mules, and asses. The forests supply hardwoods and Peruvian balsam. Some gold and silver is mined. Manufactures, designed entirely for

local consumption, are principally cheap cotton cloth, stockings, hats, soap, beverages, and tobacco products.

Foreign Trade. According to preliminary returns, imports in 1934 were valued at 20,475,000 colones (15,265,000 in 1933) and exports totaled 24,049,000 colones (20,296,000 in 1933). Coffee exports in 1934 totaled 49,866 metric tons, valued at 22,824,000 colones (56,189 tons, valued at 19,512,000 colones, in 1933). Of the 1934 imports the United States supplied 44.5 per cent; United Kingdom, 13.3; Japan, 11.1; and Germany, 8.3. Germany took 30.5 per cent of the 1934 exports; United States, 26.9; The Netherlands, 9.4. Cotton cloth, wheat flour, and iron and steel manufactures were the chief imports.

Finance. Revenues and expenditures in the fiscal year ended June 30, 1935, were 21,956,000 and 19,840,000 colones, respectively, leaving a surplus of 2,116,000 colones. Budget estimates for 1935-36 were: Revenues, 21,073,000 colones; expenditures, 20,790,000 colones. The public debt as of June 30, 1935, was 46,072,000 colones (external, 38,318,000; internal, 7,754,000). The colon exchanged at an average of about \$0.38 in 1934, and \$0.3424 in 1933.

Communications. El Salvador in 1934 had about 378 miles of narrow-gauge railways, 1475 miles of highways (including 350 miles passable to motor cars), and air lines linking San Salvador with Tegucigalpa, Guatemala City, and with the Pan American Airways network. Cutuco is the chief port. Telephone connections between El Salvador and Guatemala were established for the first time on Sept. 15, 1935.

Government. The Constitution vests executive power in a president elected for four years and legislative power in a single chamber of 42 deputies elected for one year by popular suffrage. Provisional President Maximiliano H. Martínez, who seized power by a coup d'état on Dec. 2, 1931, was declared constitutional president by Congress on Feb. 5, 1932, and was reelected in 1935.

History. Gen. Maximiliano H. Martínez insured the perpetuation of his dictatorship for another four years by securing reelection to the presidency on Jan. 13-15, 1935. Both General Martínez and his running mate, Gen. Andrés Menéndez, were unopposed. They were inaugurated as President and Vice President, respectively, on March 1. While the elections took place without disorder under the supervision of Martínez's well-equipped army, and the President showed confidence in his strength by permitting former President A. Quinones to return from exile, evidences of deep unrest manifested themselves despite the strict censorship. On Oct. 9, 1935, the government proclaimed a state of siege throughout the country and announced that it had crushed another revolutionary plot. Twenty-six of the alleged conspirators were executed on October 13, according to a Panama City dispatch to the *New York Times*.

In a radio address of January 16, President Martínez outlined his programme for the ensuing term as follows: Strict honesty in the administration of government finances; construction of public highways and public buildings; promotion of public education and social betterment; purification of public justice; improvement of sanitation facilities; aid for business and agriculture through the central and mortgage banks. In preparation for the calling of a constitutional convention to revise the fundamental law, Congress appointed a commission to study needed constitutional reforms. As a result of the budget surplus in 1934-35, the government in

July reduced the export tax on coffee from \$2.57 to \$0.82 per 100 kilos for the period of one year. In September aid was extended to business in the form of a moratorium law covering real-estate mortgages negotiated prior to Mar. 12, 1932, the date of the first moratorium law. Negotiations for a permanent agreement on the service of the foreign debt were continued during 1935 with several bondholders committees in the United States.

Travelers in Central America during the year reported that trouble appeared to be brewing between El Salvador and Guatemala, due to friction over boundary issues and the ambition of President Jorge Ubico of Guatemala to reestablish the Central American Union, with himself in the dominant rôle. Clashes between Guatemalan and Salvadorean troops were reported along the border and diplomatic relations were said to have been virtually severed.

SALVATION ARMY, THE. A world-wide organization with international headquarters at 101 Queen Victoria Street, London, England, whose purpose is the salvation of mankind from all forms of distress—spiritual, moral, and temporal. The movement was first organized as a mission in the East End of London in 1865 by William Booth, a minister of the New Connexion Methodists. It spread rapidly throughout England and in 1880, as the Salvation Army, was extended to the United States. American incorporation took place in New York City in 1899. The government is military in character with General Evangeline Booth as international head. The higher command is divided into territories, each territory usually being a separate country, or colony, led by a commissioner, and subdivided into divisions consisting of corps, posts, and institutions under the direction of officers of varying ranks. There are four such territories in the United States.

The doctrine of the Salvation Army is a simple evangelical creed based on the Methodism from whence it came. It does not concern itself with fine theological differences, but bases its activities on the belief that "They serve God best who serve their fellowmen."

During 1935 activities were commenced in two new areas—the Malay Peninsula and the British Colony of Uganda, making a total of ninety countries and colonies in which the Salvation Army is now at work. Operations in China, hitherto largely in the North, were extended to Canton in the South and to Mukden as a centre for Manchoukuo.

General Evangeline Booth, as a result of her observations of general conditions on a world tour of inspection, inaugurated in September an international evangelistic campaign with the slogan "The World for God" to be carried on simultaneously at all Salvation Army centres until Dec. 31, 1936.

In 1935 the Salvation Army was active in 90 countries and colonies, carrying on its work in 86 languages. There were in its service 26,204 officers and cadets, 9332 persons without rank wholly employed, 163,212 honorary local officers and bandsmen, 71,674 songsters, 34,788 corps cadets, and 16,776 corps and outposts in operation. Social welfare institutions and agencies numbered 1607, free day schools 1062, and Naval and Military Homes 32. It published 135 periodicals, with a total average circulation of 1,521,263 copies per issue.

There were in the United States in 1935, 1640 corps and outposts, 4477 officers and cadets, and 32,706 honorary local officers and bandsmen. Con-

verts during the year numbered 91,394. Social welfare institutions included 76 men's hotels and 12 residential hotels for young women, accommodating a total of 9265. Men's Social Service Centres numbered 110 with accommodation for 4188, 10 children's homes, with accommodation for 824, 35 women's homes and hospitals, with accommodation for 2528; and 2 dispensaries, which treated 10,619 patients. At Thanksgiving and Christmas free dinners were given to 468,927 persons, and toys to 281,044 children. During 1935, 7280 prisoners were assisted by the Salvation Army on discharge; 7,629,520 persons were afforded temporary relief outside social service centres and hotels; 37,863 mothers and children were given summer outings; 116,072 men and women given employment through the Army's 62 free employment bureaux, and 826 missing persons found.

The National Headquarters of the Salvation Army in the United States are at 120 West Fourteenth Street, New York City. National Secretary, Com. Edward J. Parker.

SALZBURG, PROVINCE OF. See AUSTRIA.

SAMOA. A group of 14 islands in the Southern Pacific, about 4000 miles southwest of San Francisco. The islands east of 171° W. longitude belong to the United States; those west of that line are administered by New Zealand under a mandate of the League of Nations.

American Samoa. American Samoa comprises the islands of Tutuila, Tau, Olosega, Ofu, Aunuu, and Rose Island. Swains Island is included in the administrative district of American Samoa. The total area is 76 square miles and the estimated population on June 30, 1935, was 11,313 (10,055 at the 1930 census). The Naval Station at Pago Pago is the seat of government. The population of the town and its vicinity was approximately 5000 on June 30, 1935. The harbor is considered the best in the South Seas. The school enrollment in 1934-35 was 2230. English is the medium of instruction. Copra is the only export crop, the production in 1934-35 totaling 2,783,728 lb., valued at \$46,951. The increase from 609 tons valued at \$14,090 in 1933-34 afforded much-needed economic relief to the people and the island government. Imports in 1934-35 were valued at \$137,784; exports, \$63,273. Government revenues (1934-35) were \$96,464 and expenditures \$85,862. The islands are under the jurisdiction of the U.S. Navy Department and are administered by the commandant of the naval station at Pago Pago. There is a native advisory council, called the Fono, which meets annually. An Organic Act for American Samoa was under consideration by the United States Congress. Governor in 1935, Capt. Otto C. Dowling, U.S.N.

Western Samoa. The islands under New Zealand's control are officially known as the Territory of Western Samoa. The two largest islands are Savaii and Upolu, with areas of 700 and 430 square miles, respectively. The population in 1935 totaled 53,427; in 1934 there were 3017 Europeans and half-castes, 49,048 Samoan natives, 632 Chinese laborers, and 95 other islanders. Apia, the chief port and capital, is on Upolu. The natives are Christians. The schools, most of which are conducted jointly by missionary groups and the government, enrolled over 15,000 pupils in 1934. Cacao, copra, bananas, and rubber are the chief crops. In 1934 exports were valued at £128,117 (copra, £60,654; cacao, £29,498; bananas, £35,796) and imports at £97,684. For the year ended Mar. 31, 1934, government revenues totaled £90,613 and expenditures

£89,955. There were 160 miles of highways. Acting Administrator in 1935, A. C. Turnbull.

SAN GABRIEL DAMS. See **DAMS**.

SANITARY ENGINEERING. See **GARBAGE AND REFUSE DISPOSAL**; **SEWERAGE AND SEWAGE TREATMENT**; **WATERWORKS AND WATER TREATMENT**.

SAN MARINO, sán má-rē'nō. An independent republic near the town of Rimini, encircled by Italian territory. Area, 38 sq. miles; population (1932), 13,948. Capital, San Marino (4000 inhabitants). The main exports were cattle, wine, and building stone. The budget estimates for 1934-35 balanced at 3,957,499 lire (lira averaged \$0.0856 in 1934; \$0.0812 during October, 1935). By the terms of a monetary convention with Italy, signed on July 15, 1935, and valid until 1938, the Royal Mint at Rome was to mint all San Marino's silver coins. Legislative power rests with a grand council of 60 members from whom 2 are appointed every six months to act as regents.

SANTO DOMINGO. See **DOMINICAN REPUBLIC**.

SAORSTAT EIREANN. See **IRISH FREE STATE**.

SÃO THOMÉ, sou'n'tō-mā', AND **PRINCÍPE**, prē'n'sē-pē. Two islands in the Gulf of Guinea, West Africa, belonging to Portugal. Area, 372 sq. miles; population (1921), 59,060. São Thomé (capital) had 3187 inhabitants.

Production and Trade. Coffee, cacao, coconuts, palm oil, and cinchona were the chief products. In 1933, imports were valued at £172,011; exports, £277,843.

Government. By a decree of May 9, 1935, the fiscal year was changed to agree with the calendar year and the budget expenditure of 9,035,237 paper escudos for the 18 months ending Dec. 31, 1936, was approved. The colony was administered by a governor.

SARAWAK, sa-ra'wak. An independent State in Borneo, under British protection. Area, 50,000 sq. miles; population, 475,000. Chief towns: Kuching, the capital (25,000 inhabitants in 1931), Sibü, and Miri. Sago, pepper, rubber, petroleum (646,655 tons exported in 1934), gold, jelutong, and cutch were the main products. In 1934, imports were valued at S\$13,959,440; exports, S\$21,458,033; revenue, S\$4,820,546; expenditure, S\$3,828,872 (Straits \$ averaged \$0.5901 for 1934). Rajah, Sir Charles V. Brooke.

SASKATCHEWAN, säs-käch'tē-wōn. A Province of Canada. Area, 251,700 sq. miles; population (1935 estimate), 978,000 compared with 921,700 (1931 census). During 1934, there were 19,715 living births, 5914 deaths, and 5519 marriages. Chief towns (with 1931 populations): Regina, the capital (53,209), Saskatoon (43,291), Moose Jaw (21,299), Prince Albert (9905).

Production. The estimated value of field crops for 1935 was \$113,122,600 (\$96,472,600 in 1934) of which wheat (132,000,000 bu.) accounted for \$79,200,000; oats (136,399,000 bu.), \$23,188,000; barley (23,722,000 bu.), \$4,744,000; potatoes, \$1,659,000; hay and clover, \$1,242,000; flaxseed, \$1,203,000; rye (5,218,000 bu.), \$1,148,000. Livestock in 1934: 1,504,500 cattle, 932,200 horses, 596,400 swine, 448,200 sheep. Fur production (1933-34): 1,541,339 pelts valued at \$1,430,834.

Mineral production (1934) was valued at \$2,977,061 of which coal (909,288 tons) represent-

ed \$1,241,130; copper (6,618,913 lb.), \$491,077; sodium sulphate (66,821 tons), \$587,986; gold (5405 fine oz.), \$186,472. In 1935, coal produced amounted to 934,096 tons valued at \$1,319,051; gold, 11,925 fine oz., \$419,641. During 1933, from the 818 factories, with 5614 workers, the net value of products was \$17,034,689.

Government. For the fiscal year ended Apr. 30, 1935, revenue amounted to \$13,686,734; expenditure, \$16,395,915; gross public debt (Sept. 30, 1935), \$182,591,692; sinking fund (Sept. 30, 1935), \$8,021,072. Budget estimates (year ending Apr. 30, 1936): revenue, \$15,624,358; expenditure, \$16,391,885.

Government was vested in a lieutenant-governor and a legislative assembly of 55 members elected for five years (50 Liberals and 5 Farmer-Laborites were elected at the Provincial general election of June 19, 1934). In the Dominion Parliament at Ottawa the Province was represented by 6 Senators (elected for life) and 21 members in the House of Commons (16 Liberal members, 2 Social Credit, 2 Cooperative Commonwealth Federation, and 1 Conservative were elected at the Dominion general election of Oct. 14, 1935). Lieutenant-Governor, H. E. Munroe; Premier, W. J. Patterson (Liberal) succeeded (on Oct. 31, 1935) James G. Gardiner who became Minister of Agriculture in the Dominion Government at Ottawa. See **CANADA** under *History*.

SAULT STE. MARIE, CANALS AT. Traffic through the canals at Sault Ste. Marie in Michigan and Ontario showed a marked improvement in 1935 over the previous year, according to the annual statement issued by Isaac De Young, General Superintendent. The number of vessels using the canals increased from 11,399 in 1934 to 12,960 in 1935, the registered net tonnage rising from 35,794,600 to 41,566,253. The total freight carried rose from 42,248,131 short tons to 48,293,308 short tons. Passenger traffic showed a slight decline, dropping from 33,636 to 32,937.

Of the freight carried, the greatest percentage of increase was in broken stone, gravel, and sand, which rose from a total of 157,856 short tons in 1934 to 502,417 short tons in 1935. Hard coal showed the greatest percentage of decline, dropping from 259,872 short tons in 1934 to 200,189 short tons in 1935. The transportation of other freight is shown in the accompanying comparative table.

FREIGHT TRAFFIC THROUGH THE SAULT STE. MARIE CANALS

	1934	1935
Lumber M ft b m	27,897	40,044
Pulpwood cords	141,632	154,713
Flour barrels	6,162,297	6,840,720
Wheat bushels	173,033,726	179,603,288
Grain, excluding wheat .. bushels	46,498,900	43,106,702
Copper tons b	30,849	53,027
Iron Ore tons b	22,945,299	29,283,943
Structural Steel and Pig Iron tons b	183,901	290,223
Coal, soft tons b	10,148,157	8,961,541
Coal, hard tons b	259,872	200,189
Salt tons b	25,010	40,819
Oil tons b	527,916	584,549
Stone * tons b	157,856	502,417
General Mdse. tons b	846,844	1,022,526

* Includes broken stone, gravel, and sand. b Short tons.

The United States canal was opened April 16 and closed December 16, a season of 245 days. The Canadian canal was opened May 2 and closed December 14, a season of 227 days. A total of

46,360,926 short tons was carried through the United States canal, of which 35,785,215 short tons was east bound, and 10,575,711 short tons was west bound. The total through the Canadian canal was 1,932,382 short tons, with 1,406,572 short tons east bound and 525,810 short tons west bound.

SAXONY. See GERMANY.

SCANDINAVIAN LITERATURE. Danish. Fiction. After some 30 years of silence, the old-time favorite, Johannes V. Jensen, came back with *Dr. Renaults Fristelser* (Dr. Renault's Temptations), the strange story of a man who is permitted to re-live his life. Johannes Buchholtz maintained his usual high standard in *Mennesker vil være Guder* (Men Wish to Be Gods), whose hero, a young Catholic priest, has an inordinate desire to control the will of his fellow men. Karl Bjarnhof's *Møl og Rust* (Moths and Rust), the story of a Danish provincial town, is noteworthy alike for its character delineation and for its local color. An enthusiastic reception was accorded Martin A. Hansen's first novel, *Nu opgiver han* (Now He Surrenders), a faithful picture of political and religious conflicts in contemporary Denmark.

Miscellany. In *Under aaben Himmel* (Under Open Sky), Martin Andersen Nexø continued his autobiography, begun three years ago, in *Et lille Kræ* (A Tiny Creature). Among books on travel should be mentioned: Peter Freuchen's *Flugten til Sydamerika* (The Flight to South America), which gives a detailed account of an aeroplane trip; O. A. Rygaard's *Mellem Tyrker og Kurder* (Between Turks and Kurds), which relates the author's interesting and sometimes thrilling experiences as an engineer in Asia Minor, and Aage Krarup Nielsen's *Marco Polos Rejser* (Marco Polo's Travels), in which Marco Polo's adventures are retold with the charm of an Oriental tale.

Norwegian. Fiction. In *Ingen vei går utenom* (There Is No Way Around), Trygve Gulbranssen again showed his ability to depict Norwegian farm life in a realistic and sympathetic manner. In *Arken* (The Ark), the younger Kristian Elster recounts the troubles of a family that moves into Oslo during the time of house famine. Johan Falkberget's *Tårn-vekteren* (The Warden of the Steeple) is the third volume in the series *Christianus Sextus*. In this, as in the two former volumes, the action goes back to the earlier part of the 18th century. The chief characters of Nini Roll Anker's *Den som henger i en tråd* (Hanging by a Thread) are a group of working women pictured against the background of modern industrial life. In Gabriel Scott's *Skipper Terkelsen's levnadsløp* (The Life of Captain Terkelsen), the hero is seen in a reminiscent mood, reviewing portions of his life. Sigurd Hoel's *Fjorten dager før frostnettene* (Two Weeks before the Frosty Nights), the story of a physician who fears the approach of old age, is a book interestingly written and full of dramatic conflicts. Under the title *Oslo fortellinger* (Tales from Oslo), Oskar Braaten published a number of his short stories written between 1910 and 1922.

Miscellany. The new interest in Ethiopia caused by recent political events has expressed itself in the publication of several books on this country. Of these, Harald Juell's *Etiopia* (Ethiopia) deserves special mention for its thorough and authoritative treatment. *Det norske Folks Liv og Historie* (The Life and History of the Norwegian People), of which Haakon Shetelig wrote the first volume some time ago, was completed through the

publication of vols. viii-x, written by Wilhelm Keilau.

Swedish. Poetry. Olof Lagercrantz' collection *Den döda fågeln* (The Dead Bird) shows a mastery of technique and a sensitiveness to linguistic niceties. Many of the poems are written in a style reminiscent of the 18th century. The poems of Nils Englund's *Nar ljusen tändas* (When the Candles Are Lighted), connected as they are through a unity of symbolism and an identity of theme, give the impression of being the successive parts of a musical suite.

Fiction. In *Paul Hoffman, laroverksadjunkt* (Paul Hoffman, Instructor), a book unique as a picture of Swedish academic life and at the same time teeming with human interest, Hugo Swensson follows the career of a preparatory school teacher from the beginning of his probation year to the end of his active service. Vilhelm Moberg's *Sankt sedebetyg* (Low Grade in Deportment) portrays a man who probes the causes of his own unhappiness. The chapters dealing with the hero's childhood and youth are especially good. The story of *Svenske Apollo* (The Swedish Apollo) by Walde-mar Hammenhog centres around a short-lived insurance company and its office force. Harry Blomberg's *Det brinner i snön* (Snow on Fire) traces the character development of a man who, unable to follow his inclinations and devote himself to scientific studies, becomes a minister of the state church. Stina Palmberg's *Svårhanterliga barn* (Difficult Children), a volume of short stories, is based on the author's experiences as a teacher.

Science, History, Criticism. Helge Nelson's *Nord-Amerika* (North America) is a thoroughly scientific and at the same time highly interesting description of the North American continent and its inhabitants. Among historical works should be mentioned Kjell L. Kumlien's *Med svenskarna och Engellbrekt* (With the Swedes and Engellbrekt), an account of the War of Liberation of 1434, and Sune Lundqvist's *Svenskarna i heden tid* (The Swedes in Heathen Times). Some of the outstanding critical works were: Olle Holmberg's *Viktor Rydbergs lyrik* (Viktor Rydberg's Lyric Poetry); Holger Ahlenius' *Tor Hedberg*; and Vilhelm de Geer's *John Keats*.

SCHECHTER CASE. See UNITED STATES under Administration.

SCHINDLER, KURT. A German-American musician, died in New York City, Nov. 16, 1935. Born in Berlin, Feb. 17, 1882, he was educated at the gymnasium there and at the universities of Munich and Berlin. He studied music under Ludwig Bussler, Conrad Ansong, Friedrich Gernsheim, and Ludwig Thuille, and made his first appearance as a composer at the Krefeld Music Festival of 1902. The next year he first appeared as a conductor at the Stuttgart Court Theatre. During 1902-03 he conducted at the Stuttgart Hoftheater, and the following year at the Würzburg Stadtheater. He became assistant to Richard Strauss at the Berlin Opera House in 1904, remaining until 1905 when he came to America as assistant conductor at the Metropolitan Opera House, New York, where he remained until 1908.

In 1909 he organized the McDowell Chorus, which because of the enlargement of the scope of its work, became the Schola Cantorum in 1912. Under his direction, many novelties of the modern composers were introduced, and he brought to the attention of American audiences the works of

Rimsky-Korsakov, Debussy, Borodin, and Sibelius. Also, at this time he accepted the position of choir master at Temple Emanu-El. In 1926 he resigned from the Schola to become director of music at the Roxy Theatre, then being built. He gave as his reason for leaving the fact that whereas he was then only reaching a few thousand people, in his new position he would be able to reach hundreds of thousands. His connection with the theatre was of short duration, and during 1926-27 he directed the Musical Forum, which he established, in a series of concerts of varied types.

Subsequently, he devoted all his time to his duties as an editor and reader for the music publishing house of G. Schirmer, a position he held since 1907. In 1922 he served as president of the Biennial Musical Festival of Catalonia, Spain, being the first foreigner to hold such a post. He arranged many folk songs and choral music, and was the editor of *Six Old French Christmas Carols* (1908); *The Development of Opera* (1912); *A Century of Russian Songs* (1912; 2d volume, 1917); *Russian Liturgical Songs*, with Charles W. Douglas (1913); *Songs of the Russian People* (1915); *Ten Student Songs of Finland* (1915); *Old Spanish Sacred Motets* (1918); *Modern Spanish Choral Works* (1918); and *Sixty Russian Folk-Songs*, 3 vols., (1918-19).

SCHOOLS. See EDUCATION IN THE UNITED STATES, and the paragraphs on *Education* under the various countries and the States of the United States.

SCHÜCKING, WALTHER M. A. A German jurist, died at The Hague, Aug. 26, 1935. Born at Munster, Westphalia, Jan. 6, 1875, he was educated at the gymnasium there and studied national economy and law at the universities of Munich, Bonn, Berlin, and Göttingen, receiving the degree of L.S.D. at the last-named in 1897. Two years later he was appointed to the faculty of the University of Breslau as a teacher of law, and in the following year became assistant professor, and in 1903, full professor. In the previous year he was made dean of the law faculty at the University of Marburg. He was promoted to the High School for Economics in Berlin in 1921, and in 1926 was made director of the Institute of International Law at the University of Kiel, where he served until 1933, when he was dismissed for "political unreliability."

During the years 1919 to 1928, he served as a Democratic member of the Reichstag, and in the former year was the chief member of the German delegation to the Peace Conference at Versailles. His knowledge of and experience in law, led to his election to the Permanent Court of International Justice in September, 1930, the first German to be appointed. Also, he was a member of the Permanent Court of Arbitration, and his efforts on behalf of peace led to his mention for the Nobel Prize Award in 1934. Schucking also served as Chairman of the League for International Understanding; deputy chairman of the League of Nations Union and founder of the German group; and chairman of the German group of the Inter-Parliamentary Union. Also, he held membership in the American Institute for International Law.

A contributor to many law journals on international law, he edited *Akten zum Kriegausbruch*, and was the author of *The Union of States of the Hague Conferences* (1912); *The League for World Peace* (1917); *Perennial Peace* (1917); *The International Law Doctrine of the World War* (1918); *Commentary on the Treaty of Versailles*

(1920); *The Geneva Protocol* (1925); *The Statute of the League of Nations* (1931).

SCOTTSBORO CASE. See ALABAMA under *Political and Other Events*; LAW.

SCULPTURE. The work of cutting in stone or marble the sculpture for buildings erected by the Federal Government in Washington, begun in 1934, continued well into 1935. Most notable were those for the Archives building by James Earle Fraser, Robert Aitken, and Adolph Weinman. A Navy and Marine Memorial by B. del Piatta was erected on a site adjacent to the Mt. Vernon boulevard. An Armillary Sphere by Paul Jennewein, through the gift of a private donor, was erected in Meridian Park, Washington. D. C. Congress approved the erection of a memorial to Grover Cleveland in the National Capital as well as a memorial to Thomas Jefferson the cost in each instance to be met by private subscription.

Early in the year the Painting and Sculpture Section of the Procurement Division of the Treasury Department commissioned Paul Manship to do a statue of Samuel Osgood and William Zorach a statue of Franklin for placement in the new Post Office building, and later in the year organized a competition to obtain 12 statues of different types of mail carriers for placement in niches in the Postmaster General's reception room. Sixty-seven models were submitted in this competition by 47 sculptors, from among which a jury, consisting of William Adams Delano, of the firm of Delano and Aldrich, architects of the building, Alice Decker, Paul Manship, and William Zorach, selected the following for award:—Berta Margoules, Stirling Calder, Sidney Waugh, Arthur Lee, Concetta Scavaglione, Carl L. Schmitz, Gaetano Cecere, Oronzio Maldarelli, Chaim Gross, Attilio Piccirilli, Heinz Warneke, and Louis Slobodkin. In addition, the jury recommended 12 other sculptors, competing, for future appointments. All of the 67 works submitted were on exhibition in the Corcoran Gallery of Art in October.

Portrait heads of President Roosevelt and eight of his administration leaders—"New Dealers"—by Reuben Nakian were exhibited first in the Corcoran Gallery of Art in April and later in the Downtown Gallery, New York, causing comment. Those represented were Secretaries Ickes, Hull, and Wallace, Under-Sec. Rexford G. Tugwell, Gen. Hugh Johnson, Donald Richberg, and Harry L. Hopkins. There were two heads of General Johnson. All of these were life-size, but the head of the President was much larger. Mr. Nakian was the sculptor of the colossal statue of "Babe Ruth," base ball player, which was exhibited in Rockefeller Center, New York, in 1934, exciting much interest. His portraits of the President and his advisors were all done in like manner and with equal zest for exaggeration which at times approached caricature. One commentator wrote that Mr. Nakian's venture deserved support as "a courageous and radical step toward divorcing the general public from the plastic platitudes of official portraiture." Certainly his way was unconventional and his likenesses not flattering.

A notable retrospection exhibition of sculpture by Gaston Lachaise, whose death occurred later in the year, was held by the Museum of Modern Art in February.

From April 16 to May 4, a retrospective exhibition of sculpture by George Gray Barnard was held in the Grand Central Galleries, New York. This was the first exhibition that Mr. Barnard has held in 27 years and it covered productions from the "Laughing Faun" of 1896 to recent allegorical

subjects purposed for his "Rainbow Arch" to be set up according to the sculptor's plan in Tryon Park, N. Y.

The collection of bronze reductions of her "Races of Mankind" sculptures done for the Field Museum, Chicago, by Malvina Hoffmann, was displayed as a notable feature at the California Pacific Exposition in San Diego in the summer of 1935.

By special invitation Paul Manship exhibited 80 of his works in sculpture in the Tate Gallery, London, in June and July,—an unusual honor as only once before was this privilege accorded a foreign artist, that being Carl Milles of Sweden.

A group exhibition of "Sculpture by Young Sculptors," 19 in number, representing two distinct movements, "realism with its spiritual concepts and modernism with its emphasis on individuality," was held in the Brooklyn Museum, May to September.

The Museum of Modern Art acquired an heroic statue of Mother and Child cut by William Zorach from a block of Florida Rosa marble.

G. MacGregor Proctor, a Yale graduate, and son of the well-known sculptor, Phimister Proctor, won the 1935 Fellowship in Sculpture of the American Academy in Rome by a group entitled "We Are the Dead." The scholarship in Sculpture offered by the Beaux Arts Institute was awarded John Amore on a group entitled "The Astronomer."

Gaetano Cecere was awarded the Lindsey-Morris Memorial prize of \$300 by the National Sculpture Society for a work in low relief shown in their annual exhibition.

The Society of Medalists issued two medals to its members in 1935. These were designed and modeled by Lorado Taft and Anthony de Francisci respectively.

In commemoration of the hundredth anniversary of the birth of Mark Twain a group by Walter Russell to be erected in Hannibal, Mo., the birthplace, was exhibited in the Grand Central Galleries. This showed the great humorist surrounded by the characters he had created. A memorial plaque was made by John Flanagan.

Phimister Proctor's superb equestrian statue of "General Robert F. Lee and the Young Soldier" for Dallas, Texas, was completed and a model in reduction placed in the Corcoran Gallery of Art. Bryant Baker did a statue of "The Young Lincoln" for Delaware Park, Buffalo.

Among the losses by death were the following well-known sculptors: Augustus Lukeman (q.v.), Douglas Tilden (q.v.), C. J. Barnhorn, Henry K. Bush-Brown, Gaston Lachaise (q.v.), Charles Henry Niehaus, Enid Yandell, Clara Hill, George E. Ganier, Guiseppe Moretti, Frank Stephens, John Paulding, Mark Hopkins, Jr.

SEISMOLOGY. R. C. Hayes has pointed out a prominent phase on seismograms of certain deep focus earthquakes which has not been recognized heretofore and which should prove quite useful in determining the focal depths of abnormally deep earthquakes. This phase has been identified as a transverse wave reaching the seismograph after having been twice reflected, first at the earth's surface near the epicentre, and then at the boundary of the earth's core. This phase is similar in character to the transverse wave which is reflected once (at the earth's core). The time interval between these two phases provides a comparatively accurate method for determining focal depths of deep earthquakes from a single seismogram (provided the seismograph is at a short epicentral distance);

this time interval is then practically independent of the epicentral distance.

There has always been the hope on the part of many persons that seismologists could find accurate ways of predicting earthquakes. Recently it has been suggested that anomalous electrical potentials may arise in the ground during the building up of the stress conditions which ultimately result in an earthquake. Electrokinetic phenomena may reasonably be looked for under such conditions, and if they could be detected and the resulting ground potentials proved to be measurable, then it is not unlikely that when mapped they would afford a clue as to the stress distribution in the district examined.

Whether this suggestion will prove valuable is not known; the problem of earthquake prediction is certainly a difficult one and those interested in it should read the comments by Landsberg, Wood, and Gutenberg (See *Science*, vol. 82, pp. 37, 219-220).

The U.S. Coast and Geodetic Survey in coöperation with other agencies has carried out many experiments on the effects of earthquakes on buildings. These experiments were begun several years ago and their results will enhance even further the ability of engineers to construct buildings which will resist earthquake shocks.

Several persons have been investigating the possibilities of using a well gauge, recording the height of water in a well, as a seismograph. The results obtained have been interesting and no doubt more work of this nature will be done. See EARTHQUAKES.

SEMBRICH, zëm'brîk, MARCELLA (PRAXEDE MARCELLINE KOCHANSKA). An American-Polish opera singer, died in New York, Jan. 11, 1935. Born at Wizniewczyk, Galicia, Feb. 15, 1858, at the age of four she began to learn the violin and piano. She succeeded in entering the Lemberg Conservatory at an early age and for several years studied piano under William Stengel, whom she later married. On the advice of Professor Epstein and Mme. Marchesi, she gave up the piano and concentrated on her voice. She studied first with Rakitansky, and later with the younger Lamperti in Milan. In May, 1877, she was married, and on June 3 made her début at Athens in *I Puritani*. She was well received and returned to Vienna to study under Professor Levy. In 1878 she was invited to sing at the Dresden Royal Opera House, and remained there two years, when she accepted an invitation to appear in England, singing for the first time on June 12 at the Royal Italian Opera. She also appeared there during the seasons of 1881-84. About this time she took her mother's maiden name, Sembrich, as her professional name.

In 1883, Mme. Sembrich was brought to New York by Henry E. Abbey in order to make effective competition between the New Metropolitan, of which he was impresario, and the old Academy of Music. Her début was made on October 24 of that year in *Lucia di Lammermoor*, and the following morning, Henry E. Krehbiel, the critic of the *New York Tribune*, wrote that she was "a singer of threefold charm—loveliness of person, address, and voice." He described her style as "exquisite and plainly the outgrowth of a thoroughly musical nature; as uniting some of the loftiest elements of art

—reposefulness of manner, smoothness and facility of execution, and such perfect balance of tone and refinement of expression as are found only in one richly endowed with deep musical feeling and ripe artistic intelligence."

She returned to Europe in the fall of 1884 and for a number of years appeared in opera and concerts at St. Petersburg, Moscow, Warsaw, Berlin, Paris, and Madrid. In 1897 she returned to America for a concert tour, and in the following year returned to the Metropolitan, singing on the second night of the season, Nov. 29, 1898, Rosina in *Il Barbiere di Siviglia*. Also, she sang Susanna in Mozart's *Le Nozze di Figaro*, Juliette in Gounod's opera, and Lucia. The following season she showed her versatility by singing in 12 operas, one of them being *Die lustigen Weiber von Windsor*, and introduced her memorable performance of the Queen in the *Magic Flute*, and also substituted for Mme. Calvé as Marguerite in *Faust*.

As in the following year (1900) it was Mme. Melba's intention to retain all the rôles in the repertory, leaving to Mme. Sembrich only the Mozart rôles and a few others, Mme. Sembrich announced that she would appear only in concert work and at the head of a small opera company of her own. She toured the country, but became ill in San Francisco and was forced to abandon her enterprise. She returned to Europe in 1901 and soon was again singing in opera. Subsequently, she returned to opera in America, and sang with Caruso when he made his début. At the close of the 1905-06 season, the Metropolitan Opera Company went to San Francisco, where it suffered in the catastrophe that occurred. Mme. Sembrich gave a concert for the relief of the members of the Company, the musicians of which had lost their instruments. On Feb. 6, 1909, she retired from the operatic stage saying in explanation, "It is because I like the sun best when it is high. It is better that I leave when every one is asking 'Why?' than later when my ability might be less." A reception was held on the stage that night, after scenes from acts from *La Traviata*, *Il Barbiere*, and *Don Pasquale* had been performed, and on the following night the musicians of the city held a banquet in her honor.

Mme. Sembrich sang occasionally in European opera but confined her American appearances to concert work, in which she introduced the singing of folk songs. In the winter of 1914 she organized the Polish Relief Committee and served as its president until 1915 when she retired because of ill health. For the season of 1916-17 she had planned a series of four historical song recitals, but her health, which she had sought to regain in Florida, would only permit her to make one performance. This last performance took place on Jan. 4, 1917, and consisted wholly of folk songs. Her husband died in May, 1917, and Mme. Sembrich retired from public life to teach singing, pupils coming from all the world over for her tutelage.

In 1933 she returned to the stage of the Metropolitan at the Jubilee Stage Show and asked that her old friends aid the Metropolitan in carrying on. On Feb. 15, 1934, she appealed to the public for aid to the Philharmonic-Symphony Orchestra of New York.

SEWERAGE AND SEWAGE TREATMENT. Actuated by the increasing need and public demand for sewage-treatment works to

check the growing pollution of both fresh and salt waters and spurred on by the desire to relieve unemployment and take advantage of Federal aid, 1935 was an active year in the construction of sewers and sewage-works. Notable among large sewers were those of New York City and the Chicago and Minneapolis-St. Paul sanitary districts. At Chicago 27.3 miles of intercepting sewer tunnels from 4 to 17 ft. in diameter were under construction. At the Twin Cities some of the sewers were deep underground in white sandstone. This material was broken down by air jets, power driven chisels and blasting. The finely pulverized stone, mixed with water, was pumped to the surface.

Treatment. A country-wide survey made for the National Resources Committee showed that the sewage of 28,400,000 people, or 40 per cent of the urban population of the United States, was receiving some degree of treatment. The states of Connecticut, New York, and New Jersey, with Congressional approval, created the Interstate Sanitary Commission to control pollution of the waters common to the three states. Chicago continues to be the largest and most active centre of sewage-works construction (see earlier YEAR BOOKS). The Chicago Sanitary District put into use a third set of Imhoff or two-story settling and digesting tanks, making 108 in a single group with a total daily capacity of 472 million gallons—by far the largest plant of this type in the world. Alongside these tanks an activated-sludge plant was put under construction. The first unit, with a daily capacity of 400 million gallons, will also be a record breaker even before it is tripled in size. Elsewhere in the same district a 136-million gallon activated-sludge plant was being built. A 200-million gallon plant of the same type has been in use since 1928.

Among other cities now building or enlarging activated-sludge plants are Providence, Hartford, Columbus, Indianapolis, and Milwaukee. (See earlier YEAR BOOKS.) Los Angeles was building a 120-million gallon sedimentation plant to replace a plant that employs fine screens. The sludge will be passed through digestion tanks, vacuum filters, dryers, and incinerators.

Other major sewage-treatment projects, for which the type of treatment has not been decided, are those at Buffalo and Detroit. Partial treatment of the sewage of San Francisco, to be carried out in stages at two large plants, has been advised by a board of consulting engineers. In view of the large volume of salt water available for dilution, only screening and aeration are considered necessary. Farther north on the Pacific Coast the Lake Washington Metropolitan Sewerage Commission of Kings County has been created with power to make plans and build intercepting sewers and sewage-treatment plants for all the communities in the county outside of the city of Seattle.

In the east, the Merrimack Sewerage District has been created, with provisional power to build and operate intercepting sewers, pumping and treatment plants for 16 communities, including Lawrence, Lowell, Haverhill, and Newburyport. This project is conditioned on (a) approval of the plans by the state department of health, as is always required in Massachusetts, and (b) a Federal allotment of at least \$10,000,000 by Jan. 1, 1936. Up to December 5 no action on this project had been taken.

Chemical Precipitation. The country-wide survey, made by the writer of this article, showed that near the close of the year 1935 about 35 American municipalities had chemical precipita-

tion plants in use, 11 plants under construction, and 25 cities had plants more or less definitely in progress. Significant for the future of the revival is the fact that a majority of the new chemical precipitation plants are designed for municipalities where either trade wastes predominate or else where plain sedimentation is sufficient except at periods of low stream flow or during ocean or lake bathing seasons, the latter as at Coney Island (New York City) or for the South Side Sanitary District centring at Waukegan, Ill. The value of chemical precipitation where seasonal part-time treatment is adequate is emphasized by the conditions in the Minneapolis-St. Paul Sanitary District, where the flow records of the Mississippi River for many years past show that for years at a stretch the river volume is sufficient to dilute the sewage of the two cities if treated by sedimentation only while for other periods that process could be advantageously supplemented by chemical precipitation for two to five months of the year, with an average of two months. In contrast the flow of the Potomac River at Washington is large and regular enough to be dealt with all the time by screening and sedimentation only.

Atlanta, Ga., is to build seven sewage-treatment plants and enlarge and improve another, giving that city and outside towns eight plants with capacities ranging from 42 million to a quarter-million gallons a day. The largest of these plants will rely on plain sedimentation most of the time, with chemical precipitation and chlorination at times of low flow of the Chattahoochee River. At a 14-million and also a 6-million gallon plant in the Atlanta district the effluent from tanks lightly dosed with precipitants will go to sprinkling filters and then to final settling tanks. In most of the large cities now building sewage-works the activated-sludge process has been adopted or else plain sedimentation aided in summer by chemical precipitation. Turning to lesser municipalities: a survey of 85 small cities that had recently built or were then building sewage-treatment plants showed the following distribution of processes and combinations: sedimentation with separate sludge digestion, 41 cities; Imhoff tanks, 26; activated-sludge, 11; sedimentation combined with trickling filters, 4; plain sedimentation, 2; one-story septic tank, 1. (*Municipal Sanitation*, July and August.)

SEYCHELLES, sā'shēl'; -shēlz'. A British colony in the Indian Ocean, consisting of about 92

islands of which the largest were Mahé (55 sq. m.) and Praslin (15 sq. m.). Total area, with dependencies, 156 sq. miles; population (1933), 28,235, compared with 27,444 (1931 census). Capital, Victoria. The chief products were copra, vanilla, cinnamon, essential oils, soap, guano, and tortoise-shell. In 1934, imports were valued at Rs823,953; exports, Rs980,104; revenue, Rs795,767; expenditure, Rs679,256; public debt, nil (rupee averaged \$0.3788 paper for 1934). Budget estimates (1935): revenue, Rs564,000; expenditure, Rs538,000. The colony was administered by a governor, assisted by an executive council, and a legislative council. Governor, A. F. Grimble.

SHAN STATES. See **BURMA**.

SHARPEY-SCHAFFER, SIR EDWARD ALBERT. An English scientist, died Mar. 29, 1935, in London, where he was born, June 2, 1850. He took his M.D. degree at Berne and Groningen and from the University of Louvain received the degree of D. Sci. Med. As assistant professor of physiology he joined the staff of University College, London, in 1874, becoming, in 1883, Jodrell Professor. He was appointed professor of physiology at the University of Edinburgh, and retired in 1933.

Dr. Sharpey-Schafer was particularly distinguished for his studies regarding muscular action and the importance of hormones to the health of human beings. In the course of the latter studies, he suggested the name *insulin* for that chemical product, for it was then thought that this hormone came from the islets and attempts were made to extract it from the pancreas. In 1903 he devised the Schafer method of resuscitation, known also as the "prone method." As this plan required no mechanical apparatus and was easily taught, it naturally adapted itself to first aid, and in 1907 was adopted by the Royal Life Saving Society. In the following year he introduced it to America when lecturing before the Harvey Society of New York, and in 1910 it was officially adopted by the Red Cross First Aid Service.

During the course of his career, Sir Edward was the recipient of many honors, including the Baly Medal of the College of Physicians (1897), Royal Medal of the Royal Society (1902); the Distinguished Service Medal of the Royal Life Saving Society (1909); the De Cyon Prize of the Academy of Sciences and Royal Institute of Bologna for work on the ductless glands (1911); the Neill Medal of the Royal Society of Edinburgh (1922), the Copley Medal of the Royal Society (1924). He was created a baronet in 1913. From 1895 to 1900 he served as general secretary of the British Medical Association, and in 1912 was its president, and as such delivered at Dundee his famous address on the "Origin of Life." Also, he was a Fellow of the Royal College of Physicians at Edinburgh and of the Royal Society.

Besides frequent contributions to the *Proceedings* and *Transactions* of the Royal Society and medical-physiological journals, he wrote: *A Course of Practical Histology* (1877); *Essentials of Histology* (1885; 6th ed., 1902); *Advanced Textbook on Physiology* (1898); *Experimental Physiology* (1910); *The Endocrine Organs*; and *History of the Physiological Society* (1876-1926). With G. D. Thane, he edited the 8th, 9th, and 10th editions of Quain's *Anatomy*.

SHAW, T. E. See **LAWRENCE**, COL. THOMAS EDWARD.

SHIPBUILDING. The total tonnage of merchant vessels launched throughout the world in 1935, as compared with 1934, as reported by *Lloyd's*

Register of Shipping, covering all vessels of 100 gross tons each and upwards for all countries except Russia, for which returns have not been available for some time, aggregated 1,302,080 tons. This was 335,000 tons in excess of the figure for 1934, and the highest recorded since 1931, when the total was 1,617,000 tons. The 1935 aggregate, however, is over two million tons less than in the last pre-war year, 1913.

Only 2 of the 10 leading maritime countries of the world, according to the report of *Lloyd's Register*, from which this article is taken, failed to show an increase over the 1934 figure. These were Japan and Italy. Their declines were slight, however, that for Japan being only 6500 tons, and for Italy, about 4000 tons. On the other hand, Germany launched more than three times as much tonnage as she did in 1934, France two and a half times, and Sweden and Denmark about twice as much. For Great Britain and Ireland, however, the gain was only slightly in excess of 10 per cent. There were somewhat larger proportional gains for Holland and Norway; while the United States showed an increase of about one-third. Great Britain and Ireland, Germany, Japan, Denmark, and Sweden were the only ones to launch over 100,000 tons.

The comparison of tonnage launched in Great Britain and Ireland, the United States, and the other maritime countries taken as a group, is shown for the last two years in the following table, the figures representing gross tons:

	1935	1934
Great Britain and Ireland	499,011	459,877
United States	32,607	24,625
Other countries	770,462	482,917
World Total	1,302,080	967,419

While Great Britain and Ireland in 1932 were launching only 44,000 gross tons more of merchant shipping than the United States, the gap since has steadily widened. Lloyd's figures show that in 1933 Great Britain and Ireland led by 123,000 tons, and in 1934 by 435,000 tons. In 1935 they increased their lead to 467,000 tons. In 1919 American shipyards launched 2,455,000 tons more than those of Great Britain and Ireland. Before the war, however, they were launching only about 1 ton to 7 for Great Britain and Ireland. In 1935 the proportion was about 1 to 15.

A marked gain was shown in the launchings of steam and motor tankers of 1000 gross tons, and upwards, each, during the past year, the advance over the 1934 total being about 140,000 tons. Germany led in tanker construction, with an increase of about 40,000 tons, followed by Denmark, whose launchings of this type of vessel advanced 36,000 tons. Gains were also reported for Sweden, Holland, Japan, and the United States, the latter increasing from only about 5000 tons in 1934, to 26,000 tons last year. Great Britain and Ireland, however, showed a decline. The contrast between

	1935	1934
Germany	67,421	24,700
Denmark	54,490	17,897
Sweden	50,802	32,150
Great Britain and Ireland	50,735	69,066
Holland	34,486	18,725
Japan	26,653	20,102
United States	26,522	4,937
Other countries	26,912	10,760
World Total	338,021	198,337

the tanker output of 1934 and 1935 is shown by the preceding tonnage table.

Of the total tanker construction of 338,021 gross tons, 280,743 tons were motor vessels.

Motorship construction generally showed a sharp advance in 1935, the gain over the launchings of this type of vessel in 1934 amounting to almost 250,000 gross tons. Great Britain and Ireland led in the amount of motorship tonnage launched, but their gain over the previous year was 60,000 tons, as compared with 80,000 tons for Germany.

GROSS TONNAGE OF MOTORSHIP LAUNCHINGS [Courtesy, *Lloyd's Register*]

	1935	1934
Great Britain and Ireland	249,605	188,994
Germany	125,598	45,009
Denmark	113,844	53,886
Japan	110,762	125,688
Sweden	104,007	48,031
Holland	46,390	43,171
Italy	22,667	25,668
United States	1,465	6,402
Other countries	38,618	26,752
World Total	812,956	563,601

It is shown by *Lloyd's* returns that during 1935, 48 steamers and motorships of 6000 to 9999 gross tons were launched as compared with 42 in 1934. Of the larger types of vessels, 10,000 tons and upwards, 23 were sent down the ways in 1935, as against 16 in 1934.

Production of sailing vessels and barges, as launched in 1935, aggregated only 11,420 tons, a decline from the small total of 12,642 tons in 1934. These craft now represent less than one per cent of the total annual launchings.

Some advance was shown in 1935 in the construction of ships fitted with steam turbines, 181,083 gross tons of these being launched, as against 169,967 tons in 1934. For ships having a combination of reciprocating engines and turbines, the 1935 launchings aggregated 70,788 tons, compared with 37,740 tons in the previous year.

For vessels built on the Isherwood system of longitudinal framing, the 1935 launchings totaled 111,288 gross tons, as compared with 71,381 tons in 1934.

Several changes occurred in the ranking of the various ship-constructing countries last year. Great Britain and Ireland retained their lead, as usual, but Germany, with a gain of more than 150,000 tons over her total launchings in 1934, took second place from Japan, by a margin of 80,000 tons, the latter country dropping to the third position, held by Germany in 1934. Comparisons in the volume of tonnage launched by the various countries during the past two years is shown by *Lloyd's* in the following table, the figures representing gross tons:

	1935	1934
Great Britain and Ireland	499,011	459,877
Germany	226,343	73,733
Japan	145,914	152,420
Denmark	122,095	61,729
Sweden	105,538	49,542
Holland	57,133	46,905
France	42,783	15,950
United States	32,607	24,625
Norway	25,716	18,857
Italy	22,667	26,638

The largest vessels launched in the world during 1935 were built in Great Britain and Ireland. These were the *Athlone Castle* and the *Stirling Castle*, each with a gross tonnage of 25,500.

SHIPPING. According to the annual report of the U.S. Bureau of Navigation and Steamboat In-

spection, on June 30, 1935, the merchant marine of the United States, including all kinds of documented craft, comprised 24,919 vessels of 14,653,756 gross tons, as compared with 24,904 vessels of 14,861,834 gross tons on June 30, 1934. Of this total, there were 3873 vessels of 4,569,124 gross tons engaged in the foreign trade, as compared with 3842 vessels of 4,606,623 gross tons on June 30, 1934.

Since June 1, 1921, when our tonnage in the foreign trade reached its greatest volume, 11,077,398 gross tons, there has been a gradual falling off of 6,508,274 gross tons. The decrease in the foreign trade tonnage is due principally to the scrapping of large vessels which belonged to the Shipping Board and to changes from foreign to coasting trade because of greater opportunities in that service.

Since June 1, 1921, the coasting trade tonnage, exclusive of the trade on the Great Lakes, has increased 3,732,160 gross tons.

During the year, 748 vessels of 62,919 gross tons were built and documented, and on July 1, 1935, there were building or under contract to build in our shipyards for private shipowners 49 vessels of 20,292 gross tons. The corresponding figures for 1934 were 724 vessels of 66,649 gross tons built and 53 vessels of 38,102 gross tons under contract to build. Only 1 steel steam vessel of over 1000 gross tons was built during the fiscal year 1935, this vessel being a tanker of 9511 gross tons and licensed for the coasting trade.

On June 30, 1935, the laid-up tonnage of the United States aggregated 2291 vessels of 2,794,098 gross tons, as against 2551 vessels of 3,125,138 gross tons on June 30, 1934.

The disasters to the steamships *Morro Castle*, *Mohawk*, and *Havana* were intensively studied by the Bureau to determine the fundamentals lying behind these disasters.

It was determined that the prevention of the recurrence of similar disasters will depend largely upon the extent to which the Bureau has jurisdiction and control over ship personnel, ship operation, and the design and construction of vessels. These are the three great fundamentals involved.

During the fiscal year 236,260,737 passengers were carried on vessels that are required by law to report the number of passengers carried. Dividing this number by 166, the total number of passengers lost, shows that 1,423,257 passengers were carried for each one lost. During the year 844 lives were directly saved by means of the life-saving appliances required by law.

The total number of lives lost from all causes, passengers and crew, was 350, an increase of 184 over the previous year. Of the lives lost, 146 were from suicide, accidental drowning, and other causes beyond the power of the service to prevent, leaving a loss of 204 chargeable to such accidents as fire, collision, foundering, etc. See MARINE DISASTERS.

SHOE INDUSTRY. The production of leather shoes and slippers in the United States during 1935 was estimated by the *Boot and Shoe Recorder* in its annual summary at 368,000,000 pairs, an increase of about 3 per cent over the production for 1934 of 357,119,401 pairs. The estimated consumption, as compiled by the same publication, for the two years showed a similar rise, from 357,361,000 pairs in 1934 to 366,349,000 in 1935. The greatest increase, as shown in the table below, was in the production of women's shoes. Carefully considering the annual increase in population, the *Boot and Shoe Recorder* has calculated on the basis of the past fifteen years that the yearly nor-

mal consumption of shoes is 2.85 pairs per capita. The consumption in 1935 was slightly in excess of this, 2.88 per capita, as against 2.83 in 1934. By classes, the consumption of women's shoes in 1935, with 1934 figures in parentheses, was 3.20 pairs (3.13); men's, including boys over 15, 2.01 pairs (1.96); misses' and children's, 2.85 pairs (2.74); boys', 1.38 pairs (1.48); infants', 1.96 pairs (1.77); and of miscellaneous types, chiefly slippers, 0.43 pairs (0.43). The steady decline in the consumption of boys' shoes, dropping from a peak of 1.93 per capita in 1928 to 1.38 in 1935, is attributed to the greatly increased use of rubber-soled canvas shoes as regular items of footwear.

U. S. PRODUCTION AND CONSUMPTION OF BOOTS AND SHOES

[In thousand pairs, from *Boot and Shoe Recorder*]

Kinds	1934		1935 *	
	Produc- tion	Consump- tion	Produc- tion	Consump- tion
All kinds	357,119	357,361	368,000	366,349
Women's	138,317	141,344	146,644	146,403
Men's	91,419	90,019	94,436	92,829
Misses' and chil- dren's	34,520	33,869	35,785	35,199
Boys' and youths' ..	17,348	18,646	17,386	17,367
Infants'	19,451	18,515	20,410	19,930
Miscellaneous types, chiefly slippers ..	56,064	54,968	53,239	54,621

* Estimated.

The final production figures for 1935 for boots, shoes, and slippers, other than rubber, and representing approximately 99 per cent of the total output, as issued in March, 1936, by the U.S. Bureau of the Census, Department of Commerce, were appreciably higher than given in the estimate in the foregoing table. According to this report, the total production in 1935 was 383,761,499 pairs. The total was divided into the following classifications: Men's dress shoes, 73,414,890; men's work shoes, 26,110,166; boys' and youths', 17,846,519; women's 145,230,909; misses' and children's, 37,275,876; infants', 21,167,314; athletic, excluding footwear with fabric uppers and rubber soles, 1,960,749; part leather and part fabric, 2,891,088; all fabric, 3,671,231; slippers andoccasins for house wear, 42,055,011; barefoot sandals, beach sandals, and all other footwear, 12,137,746.

SHOOTING. J. B. Royall of Tallahassee, Fla., attended his first Grand American trapshoot at Vandalia, O., in 1935, the richest and most important of all trapshooting events, and strode away with the sport's highest honors, the Grand American Handicap. The 51 year old railroad conductor defeated 614 of the nation's best marksmen to succeed Lawrence George Dana to the laurels. First tying S. G. Vance of Tillsonburg, Ont., with 98 targets hit, Royall went on to crack 47 of 50 in the shootoff to win by a margin of one from his Canadian rival. In third place was one of the sport's big winners, Joe Hiestand, Hillsboro, O., farmer, who captured the American and North American amateur singles and doubles championships and the 500-target world's amateur championship. Elmer Torge, of Wales Center, N. Y., with a perfect score of 200 won the champion of champions title. Fred Tomlin of Glassboro, N. J., won the professional title with 200. In the national skeet championship, staged at Solon, O., L. S. Pratt, of Indianapolis, won the all-bore championship. H. B. Joy of Detroit was winner of the .20 gauge title, Billy Clayton of Calvin, Okla., the small bore crown and Miss Esther Ingalls of Hot Springs, Va., the women's honors.

National rifle shooting honors were taken at

Camp Perry, O., by Serg. Claude N. Harris, of Lancaster, Calif., a Marine. The Marine Corps won team laurels. The United States retained the International Dewar Trophy and also took the R.W.S. Trophy. The United States Naval Academy was winner of the intercollegiate small-bore championship and the Leech Cup went to James A. Wade of Salt Lake City.

R. D. Boerem of the Michigan National Guard won the N.R.A. individual title with pistols and the Marine Corps took team honors.

SHORTT, EDWARD. An English barrister and politician, died in London on Nov. 10, 1935. Born in St. Anthony's, Newcastle, Mar. 10, 1862, he was educated at Durham School as a King's scholar and at Durham University where he was Lindsay scholar of University College. He graduated in 1884 and later received an honorary D.C.L. Called to the bar by the Middle Temple in 1890, he joined the North-Eastern Circuit and became proficient in both civil and criminal practice. From 1907 to 1918 he was Recorder of Sutherland, and from 1910 to 1922 he served as Liberal member from West Newcastle, and was known as a clear and lucid debater, being frequently heard on the Home Rule Bill of 1912. Also, in 1910 he became King's Counsel.

During 1917 he served as chairman of the Select Committee to review the general administration of the Military Service Acts, and in August issued a drastic report which was subsequently acted upon. Its chief feature was a recommendation that the medical examination be transferred from the War Office to a civilian authority. His judicious handling of this difficult subject was a turning point in his political career.

He succeeded Mr. Duke (Lord Merivale) as Chief Secretary for Ireland in April, 1918, and shortly after taking office German intrigue was discovered and about 150 Sinn Feiners were imprisoned. By July the situation had improved and thereafter there was little trouble. After the General Election of 1918, he was promoted to Home Secretary, which he held for over two years. During his administration occurred the police strike of March, 1919, over recognition of the National Union of Police and Prison Officers. Although the situation did not become acute in London, in the provinces, and especially at Liverpool, it was more serious. Mr. Shortt showed courage and skill in handling the matter and an agreement satisfactory to all was reached. With the fall of the Coalition Government in October, 1922, his political career ended, and upon his resignation he was appointed Commissioner of Assize on the Midland Circuit.

He served in 1926 as chairman of the committee on the rating of machinery, and later was chairman of the committees on trusts and heavy motor traffic, and a member of the Defence of the Realm (Losses) Royal Commission. He succeeded T. P. O'Connor as chairman of the British Board of Film Censors in 1929, and served as chairman of the committee of investigation into the Agricultural Marketing Act in 1933.

SIAM. An independent monarchy of southeastern Asia. Capital, Bangkok, sovereign in 1935, Ananda Mahidol, who succeeded King Prajadhipok on Mar. 3, 1935 (see *History*).

Area and Population. With an area of 198,188 square miles, Siam had a population estimated on Mar. 3, 1934, at 12,743,000 (11,506,207 at the 1929 census). The population in 1929 included 10,493,304 Siamese, 445,274 Chinese, 479,618 Indians and Malays, 60,668 Cambodians, and 1920 Europeans

and Americans. Bangkok and its suburbs had 550,000 inhabitants in 1932; Ayadhyia (1929), 272,000. Buddhism is the prevailing religion.

Education. Elementary education in the Siamese language is compulsory and most of the schools provide free tuition. In 1933 there were 6081 local primary schools, with 695,954 pupils, and 1307 private schools, with 59,135 pupils. Government schools numbered 250, with 43,037 pupils. A new university for the teaching of law, politics, and economics was founded in 1934. Medicine, engineering, arts and sciences, and nursing and midwifery are taught at Chulalankarana University at Bangkok.

Production. Agriculture is the main occupation, supporting directly about 83 per cent of the population. Rice is not only the main crop and chief article of diet, but also the leading export. The 1934-35 rice crop was estimated at 5,184,000 tons from 8,457,280 acres (4,938,452 tons from 8,113,276 acres in 1933-34). Production of other crops in 1933-34 was: Rubber, 206,339 piculs (1 picul equals 133.3 lb.); tobacco, 171,292 piculs; pepper, 28,116 piculs; cotton, 31,974 piculs; coconuts, 164,187,828 nuts. Livestock in 1934 included 5,154,134 buffaloes, 5,461,957 bullocks, 311,388 horses, and 10,632 elephants. Exports of teak, the principal forest product, were valued at \$2,050,212 in 1934. Tin output in 1934 was approximately 10,300 metric tons, although Siam's export quota for the year under the International Tin Restriction Scheme was only 9800 tons. Rice milling is the chief manufacturing industry.

Foreign Trade. For the fiscal year ended Mar. 31, 1935, imports were valued at 88,523,017 bahts (92,963,376 in 1933-34) and exports at 167,735,590 bahts (144,079,012 in 1933-34). The chief sources of 1933-34 imports (in 1000 gold dollars) were: Japan, 4307; Singapore, 3705; Netherland India, 3393; Hong Kong, 3314; United Kingdom, 3195. Exports (in 1000 gold dollars) went chiefly to: Hong Kong, 11,280; Singapore, 10,420; Penang, 9775. In the calendar year 1935 imports from the United States totaled \$1,758,054; exports to the United States, \$160,381.

Finance. Budget estimates for the fiscal year ending Mar. 31, 1936, placed receipts at 94,597,839 bahts (74,467,088 in 1934-35) and expenditures at 94,585,315 bahts (74,453,225 in 1934-35). Actual ordinary revenues in 1934-35 totaled 85,961,458 bahts; ordinary expenditures, 85,948,929 bahts.

The public debt on Mar. 31, 1934, stood at £9,134,232 sterling (£8,568,438 on Mar. 31, 1933). The Treasury balance on Mar. 31, 1935, amounted to 67,523,104 bahts. On May 11, 1932, the baht or tical was pegged to sterling at the rate of 11 bahts to the pound.

Communications. The State Railways, aggregating 1857 miles of line in 1933, carried 3,259,443 passengers and 1,053,342 tons of freight in 1933-34. About 100 miles of new line was under construction. Highways extended about 2750 miles. Civil air lines linked the principal cities. A total of 1028 vessels of 1,226,730 register tons entered the port of Bangkok during 1933-34.

Government. The Constitution of Dec. 10, 1932, adopted following the military overthrow of the absolute monarchy, established a constitutional monarchy, in which the King exercised executive power through a State Council appointed by him but responsible to the National Assembly. The King also exercised legislative power with the advice and consent of the National Assembly. Half the members of the Assembly are nominated by the

King and half elected by popular male and female suffrage. The King retained the power to veto legislation, dissolve the Assembly, declare war, and conclude treaties. President of the Council of State and State Councillor for Foreign Affairs in 1935, Col. Phya Phahol Pholphayuha Sena.

History. The long conflict between King Prajadhipok and the revolutionary group headed by Col. Phya Phahol, which seized power in 1932, ended with the King's formal abdication on Mar. 2, 1935. (For the background of Prajadhipok's abdication, see the *NEW INTERNATIONAL YEAR BOOKS* for 1932, 1933, and 1934.) In his abdication manifesto, issued in England, the King said that he accepted Phya Phahol's invitation to continue as constitutional monarch in 1932 on the understanding that a Constitution would be granted and that the public would have a voice in administration. Attributing the military revolt of 1934 to the government's neglect of popular opinion, Prajadhipok declared that he would not surrender his power "to any individual or party so that that power can be wielded in an autocratic way without the people having any voice." Consequently, he felt called upon to abdicate, but he reserved the rights which he had enjoyed before his accession.

On March 7 the government in Bangkok simultaneously proclaimed Prajadhipok's abdication and the succession to the throne of his nine-year-old nephew, Ananda Mahidol. Both proclamations were antedated to March 3. Coronation of the new king was postponed for two years; meanwhile he was to remain in school in Switzerland. A Council of Regency was appointed, consisting of Princes Anuvatana and Aditya, cousin and nephew, respectively, of the ex-King, and Chao Phya Yommaraj, a former Minister of the Interior. Prince Anuvatana, chairman of the board of regents, died on August 12, and Prince Aditya succeeded him. Gen. Chao Phya Bijayandra Yodhin was named the third regent.

During the last days of its session, which ended on Mar. 31, 1935, the National Assembly passed numerous laws. The new Ministry of Agriculture was created, the taxation system was further amended, the government received power to utilize for public purposes deposits of materials and minerals in private hands, the Cooperative Credit Societies Act was amended, etc. These new measures, following upon the King's abdication, caused a general slackening of business activity, which in turn aggravated the existing political unrest. Early in August there was another revolutionary outbreak among the lower ranks of army officers. The outbreak was crushed and the ringleaders, who were alleged to have conspired to assassinate Prince Aditya, Luang Pradit, and other prominent members of the government, were severely punished. Sentences ranging from death to 16 years' imprisonment were imposed upon 13 of the rebel officers on September 9.

The strongly nationalistic policy of the government was reflected in laws promulgated during 1935 making all persons born in Siam subjects of that kingdom and providing that education in the Siamese language was compulsory for all children between the ages of 7 and 14. Protests of the large Chinese population in Siam against these decrees were disregarded. It was reported in July that the Nanking Government was planning retaliatory measures of an economic nature, particularly a ban on imports of rice from Siam. The Bangkok authorities meanwhile were rapidly strengthening their army, navy, and air forces by extensive purchases of foreign armaments. Numerous indications

of a continued rapprochement between Siam and Japan were reported during the year. Siamese military and naval officers were being trained in Japan, Japanese exports to Siam recorded a phenomenal gain, and steps towards closer economic collaboration were taken. Siam, so long partially isolated from world affairs, was apparently being swept into the maelstrom of international rivalries in the Far East.

SIBERIA. The general name applied to the vast area of northern Asia extending from the Ural Mountains to the Pacific and from the Arctic Ocean to Manchuria, Mongolia, and Soviet Central Asia. Siberia was divided into administrative units of the R.S.F.S.R., the largest of the seven constituent republics forming the U.S.S.R. (q.v.). The divisions, with capitals in parentheses, are shown in the accompanying table.

<i>Division (Capital)</i>	<i>Sq. m.</i>	<i>Pop. (1931)</i>
Ural Area * (Sverdlovsk)	660,000	7,688,400
W Siberian Area (Novosibirsk) ..	503,653	8,767,200
E Siberian Area * (Irkutsk)	1,377,441	3,143,400
Yakutsk Republic (Yakutsk)	1,552,994	308,400
Far Eastern Area (Khabarovsk) ..	900,731	1,593,400
Total	4,994,819	21,500,800

* Includes a small section of European U.S.S.R. * Includes Buriat-Mongol Republic (150,193 sq. m.; 3,143,400 people; capital, Ulan-Ude).

Chief towns (with 1933 populations in parentheses): Sverdlovsk (481,000), Novosibirsk (294,000), Omsk (227,000), Vladivostok (190,000), Irkutsk (158,500), Tomsk (128,400), Barnaul (109,200), Krasnoyarsk (101,500), Yakutsk (10,558).

SIBERT, BRIG. GEN. WILLIAM LUTHER, U.S.A., RET. An American army officer and engineer, died near Bowling Green, Ky., Oct. 16, 1935. Born at Gadsden, Ala., Oct. 12, 1860, he attended the University of Alabama from 1878 to 1880, and in 1884 graduated from the United States Military Academy with honors, and on June 13 of that year, was commissioned a 2d lieutenant of engineers. Desirous of furthering his career, he entered the Engineering School of Application, graduating in 1887, and was then assigned as an assistant engineer on river work in Kentucky. The following year he was promoted to 1st lieutenant.

From 1892 to 1894, he served as an engineer on the Sault Ste. Marie Canals at Sault Ste. Marie in Michigan, and was then transferred to Arkansas to become engineer in charge of the river and harbor district there. Two years later (1896) he was made a captain, and in 1898 became instructor of civil engineering at the School of Application. He held this position for a year and was then assigned to the 8th Army Corps in the Philippine Islands as chief engineer and general manager of the Manila and Dagupan Railroad. Returned to the United States in 1900, he was made chief engineer of the river and harbor district of the eastern section of the country with headquarters at Louisville and Pittsburgh. He held this post until 1907, having in the meantime (1904) been promoted to major.

With the construction of the Panama Canal, Major Sibert was appointed a member of the Isthmian Canal Commission in March, 1907, and as such had charge of the construction of the Gatun Locks and Dam of the Panama Canal; the west breakwater of Colon Harbor, and excavation of the Channel from Gatun to the Atlantic Ocean. He was relieved of these duties in April, 1914, and under the joint auspices of the American Red Cross and the Chinese Government, he served, from June to

October, 1914, as chairman of the board of engineers on the flood prevention problem of the Huai River Valley. On Mar. 4, 1915, he was promoted to brigadier general and received the thanks of Congress for his work on the Panama Canal.

At the entrance of the United States in the World War, General Sibert was the commander of the Pacific Coast Artillery District. Commissioned a major general on June 28, 1917, he was given the command of the first division of American troops sent to France under General Pershing. He held this post but a short time, and from January to May, 1918, served as commander of the Southeastern Department at Charleston, S. C. He was then called to Washington to organize and direct the Chemical Warfare Service of the United States Army, which, under his administration, developed into an important branch of the Service. While Director he successfully opposed Gen. Peyton C. March and Secy. of War Newton T. Baker, who believed that the Bureau should not be a separate section of the Army organization. He retired Apr. 4, 1920. For his services during the War he was awarded the Distinguished Service Medal by the United States and was made a Commander of the Legion of Honor by France.

From Nov. 26, 1923, General Sibert was chairman and chief engineer of the Alabama State Docks Commission, which had charge of the construction of a system of piers and terminals in Mobile costing \$10,000,000. In July, 1928, he served, by appointment of President Herbert Hoover, as chairman of a board of engineers and geologists to report on the economic and engineering feasibility of Boulder Dam.

He was a member of the American Society of Civil Engineers and of the American Association of Port Authorities, which he served as president during 1929-30.

SIERRA LEONE, sī-ēr'a lē-ō'nē. A British West African crown colony and protectorate. Total area, 27,925 square miles, of which the part governed as a colony (Sierra Leone peninsula; the Tasso, Banana, Turtle, and York Islands; and the township of Bonthe on Sherbro Island) equaled 260 square miles. Total population (1931 census), 1,768,479 of whom 96,422 were in the colony. Free-town, the capital (55,359 inhabitants in 1931), is the greatest seaport in West Africa and an Imperial coaling station.

Production and Trade. Kola nuts, palm kernels, palm oil, ginger, diamonds, gold, platinum, pissava, hides, and rice were the main products for export. In 1934, total imports were valued at £805,227; total exports, £1,011,875 of which palm kernels accounted for £360,780. Cotton goods, apparel, coal, hardware, provisions, and tobacco were the chief imports.

Government. For 1934, revenue (including £72,500 from the Colonial Development Fund) amounted to £598,839; expenditure, £603,208. The colony and protectorate were administered by a governor assisted by an executive council and a legislative council. Governor in 1935, Sir Henry Monck-Mason Moore.

SILESIA, sī-lē'shī-a; -sha. (1) A part of the province of Moravia and Silesia in Czechoslovakia. (2) A county of Poland. (3) The two Prussian provinces—Lower Silesia and Upper Silesia.

SILK. Though the rapid growth of the rayon industry has continued its inroads into the silk industry, there was an appreciable upward rise in silk consumption in the United States during 1935. Production figures are not available, but deliveries

to the United States rose to 497,143 bales as compared with 461,706 bales in 1934. The increased demand, together with a curtailment of production in Japan and an increased consumption in Japan, effected a rise in price of raw silk from a low of \$1.31 per pound on March 12, to a high of \$2.14½ in November, with the year closing at \$2.04½.

SILVER. According to the advance summary issued by the U.S. Bureau of Mines, the mine production of silver in the United States and the Philippine Islands totaled 48,047,899 oz., an increase of 46 per cent above the production in 1934, which totaled 32,982,433 oz. The value of the 1934 production at \$0.46+ per ounce was \$21,321,976 and the value of the 1935 production at the weighted average of \$0.738 was \$35,459,349, an increase of \$14,137,373 or 66 per cent. Production of silver in 1933 was 23,317,159 oz., valued at \$0.35 per ounce, or \$8,161,006. The increase in 1935 over 1933 was 106 per cent in quantity and 334 per cent in value.

Producers of newly mined silver in the United States in 1935 began the year under the stimulus of the Government price of \$0.646+ (one-half of the coinage value of \$1.2929+). Acting under the President's proclamation of Dec. 21, 1933, and the Silver Purchase Act of 1934, the Secretary of the Treasury on April 10 raised the price paid to \$0.7111 (55 per cent of the coinage value) and on April 24 to \$0.7757 (60 per cent of the coinage value). See UNITED STATES under *Administration*.

By States and regions, the mine production of silver in the United States for the years 1934 and 1935 is shown in the accompanying table.

	Ounces		Per cent
	1934	1935	
Western States and Alaska:			
Alaska *	168,868	203,465	+ 20
Arizona	4,448,474	6,375,000	+ 43
California	844,413	1,117,700	+ 32
Colorado	3,475,661	4,605,845	+ 33
Idaho	7,394,143	10,150,000	+ 37
Montana	4,006,468	9,370,000	+ 134
Nevada	3,057,114	4,280,000	+ 40
New Mexico	1,061,775	1,052,900	- 1
Oregon	46,560	112,000	+ 141
South Dakota	99,741	142,513	+ 43
Texas	851,442	976,900	+ 14
Utah	7,111,417	9,133,900	+ 28
Washington	44,120	50,900	+ 15
Wyoming	710	793	+ 12
Eastern States			
Alabama	361	395	+ 9
Georgia	48	75	+ 56
New York	21,750

Illinois	310	3,147	+ 915
Michigan	529
Missouri	63,066	101,024	+ 60
Philippine Islands *	226,524	303,604	+ 34
Puerto Rico	11	8	- 27
Total	32,982,433	48,047,899	+ 46

* Refinery receipts.

The American Bureau of Metal Statistics estimates the world production of silver in 1935 at 204,084,000 oz. The estimate, however, is exclusive of the production in Katanga, which amounted to 3,369,300 oz. in 1934. If that region produced the same amount in 1935, the total for the world in 1935 would be about 207,000,000 oz. as compared with about 185,588,000 oz. in 1934. Mexico is given as the greatest producer with 75,606,000 oz. The Canadian output, according to the official estimate

of the Dominion Bureau of Statistics, was 16,413,482 oz., slightly under the output of 1934.

SILVER PURCHASE ACT. See **CHINA** under *History*; **UNITED STATES**.

SIMMONS COLLEGE. A nonsectarian college for women in Boston, Mass., founded in 1899. The enrollment on Nov. 1, 1935, was 1515. The faculty numbered 145. The productive funds of the institution amounted to \$3,419,999, and the income for the year was \$534,299. There were 56,700 volumes in the library. President, Bancroft Beatley, A.M.

SINGAPORE. See **STRAITS SETTLEMENTS**.

SINKIANG. See **CHINA** under *History*.

SINUS PRINTS. See **MEDICAL JURISPRUDENCE**.

SKATING. Figure. Miss Sonja Henie of Norway and Karl Schafer of Austria remained supreme in figure skating during 1935, both retaining their oft-won world's titles. These two demonstrated their superiority with ease and practically assured their countries of decisive triumphs in the 1936 Olympic games at Garmisch-Partenkirchen. Miss Liselotte Landbeck of Vienna was second to Miss Henie in the European championships and Miss Cecilia Colledge of England second in the competition for world's honors.

A new national senior champion was crowned at New Haven when fifteen year old Robin Lee conquered the veteran champion, Roger F. Turner of Boston. Miss Maribel Vinson of Boston, returning to competition after a year's absence, easily won the women's championship. The men's junior title went to Eric Reiter, of Minneapolis, and the women's junior was taken by Miss Polly Blodgett, of Boston. Miss Vinson and George Hill took the senior pairs honors and the junior pairs title was captured by Miss Jeanne Schulte and Oliver Haupt, Jr., of St. Louis. Miss Ardelle Kloss of Brooklyn and Bruce Mapes, also of Brooklyn, were supreme in the Middle Atlantic competition. The season came to a glorious end when most of the leading Europeans gave an exhibition at Madison Square Garden, New York.

Speed. Allan Potts, of Brooklyn, a topnotcher in the sport for ten years, was outstanding in the speed skating field, winning the Middle Atlantic, New York State, Interstate and Brooklyn honors. The world's championship went to Michael Staksrud of Norway, and the national championship was taken by Marvin Swanson of Minneapolis. Miss Kit Klein of Buffalo won the women's national honors. The North American indoor crown went to Alex Hurd, of Kirkland Lake, Ont., and women's honors were taken by Miss Leila Brooks of Toronto. Miss L. S. Nielsen of Norway was women's world's all around champion.

SKIDMORE COLLEGE. A nonsectarian college for women at Saratoga Springs, N. Y., founded in 1911. The enrollment for the autumn of 1935 was 703. The faculty numbered 75. The endowment amounted to \$781,314, while the income on an accrual basis was \$26,760. The library contained 46,061 books and pamphlets. President, Henry T. Moore, Ph.D.

SKIING. The severe and snowy winter of 1935 served to make the public of the Eastern United States ski conscious and the sport grew amazingly. The unusually long winter permitted the United States Associations to carry out their competitive plans in full.

Roy Mikkelsen regained the national jumping crown at Canton, S. D., and Ottar Satre, of Salisbury, Conn., won the cross-country title. He also won the Eastern jumping championship at Rum-

ford, Me. Sverre Fredheim of Minneapolis won the Olympic trial on the giant Ecker Hill at Salt Lake City. Hannes Schroll, an Austrian, won the Olympic trials in the slalom and downhill events, with Robert Livermore, of Boston, second in the slalom. Richard Durrance, of Dartmouth College, was third in the slalom and second in the downhill running. Ottar Satre won the combined jumping and cross-country event at Lake Placid.

SLOVAKIA. See **CZECHOSLOVAKIA**.

SMITH COLLEGE. A nonsectarian college for women in Northampton, Mass., founded in 1871. The enrollment for the autumn of 1935 was 2026, while that for the summer was 332. There were 229 faculty members. The productive funds amounted to \$6,308,721.17, and the income from funds was \$265,679.76. The volumes in the library numbered 229,348. President, William Allan Neilson, Ph.D., LL.D., L.H.D., Litt.D.

SMITHSONIAN INSTITUTION. An organization founded in 1846 according to the terms of the will of James Smithson of England, who in 1826 bequeathed his property to the United States of America "to found in Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." The enterprises, supported wholly by Congressional appropriations but administered by the institution, include the United States National Museum, National Gallery of Art, Bureau of American Ethnology, International Exchange Service, National Zoological Park, and Astrophysical Observatory. It also administers the Freer Gallery of Art.

During 1935 the Astrophysical Observatory and its three observing stations continued the study of the relation of the periodicities in the weather to similar periodicities found in the variation of the solar constant of radiation. In the Division of Radiation and Organisms, experiments were carried through relating to the growth of tomato plants under controlled conditions of temperature, humidity, and radiation; the growth of wheat outdoors with controlled quantities of carbon dioxide, and the dependence of the growth of wheat and of algae on the wave lengths of radiation. In anthropology, special attention was given to the problem of the so-called Folsom Man, to whom is attributed the earliest known phase of aboriginal American culture. In Colorado, a Smithsonian expedition unearthed for the first time a variety of implements belonging to that culture, including many typical Folsom points. The Walter Rathbone Bacon traveling scholarship was awarded to Dr. Richard E. Blackwelder for an intensive study of the staphylinid beetles of the West Indies.

The expendable income of the Institution for 1935, consisting of income from investments, income from miscellaneous sources, and gifts for special objects (excluding income from the Freer endowment) was \$178,587. Its endowment funds (exclusive of the Freer endowment) totaled \$1,808,107. There were published by the institution and the government bureaus under its direction, 64 volumes and pamphlets, of which 124,186 copies were distributed to libraries, educational institutions, and individuals. Among these were: *Archeological Investigations in the Bay Islands, Spanish Honduras*, by William D. Strong; *A Folsom Complex: Preliminary Report of Investigations at the Lindenmeier Site in Northern Colorado*, by Frank H. H. Roberts, Jr.; the second volume in the Freer Gallery of Art's series of Oriental Studies, *A Descriptive and Illustrated Catalogue of Miniature Paint-*

ings of the Jaina Kalpasūtra as Executed in the Early Western Indian Style, by W. Norman Brown; and several papers embodying the results of the investigations of the Division of Radiation and Organisms. The secretary of the institution is Charles G. Abbot, D.Sc.; the assistant secretary, Alexander Wetmore, Ph.D.

SOCCER. Mainly because of a visit to the United States by a picked team from the Scottish Football Association, the game of soccer was distinctly on the upgrade in 1935 and made a satisfying start on the new season. The visitors played four games in the United States, defeating the First Germans at Philadelphia, the American League before 22,000 at the Polo Grounds in New York, the Illinois All-Stars at Chicago, and an all-Eastern team at Newark. Another notable tour was made by the New York Americans, who played in Mexico, winning three games and losing the same number.

The National Challenge Cup was taken by the Central Breweries Eleven of St. Louis, after a three-game final with the Pawtucket Rangers, winner in the Eastern section. St. Louis won the first game, 5-2, tied the second 1-1, and lost the third, 3-1, but took the coveted cup on total goals, 7 to 6. All three games were well attended as were most of the professional games throughout the country during the year.

The Amateur Cup of the United States Football Association was captured by the W. W. Riehl Soccer Club of Castle Shannon, Pa., which eliminated the Fall River All-Americans in the final to succeed the Philadelphia Germans, 1935 leaders of the American League, as champions. The Reliable Stores of New Bedford, Mass., downed the Greenock West of Scotland Juniors for the junior all-Eastern championship, and the St. Mary's Celtics of Brooklyn won the New York State Association cup series from Greenock West of Scotland.

SOCIALISM. The long expected split in the ranks of the American Socialist Party took place late in 1935, the final break being marked by the action of the New York City left-wing group in walking out of a session of the New York City Central Executive Committee. The leader of the left-wing was Norman Thomas, twice Socialist candidate for President, and while the issue was far from settled as the year drew to a close, it seemed likely that he would carry the majority of the party members with him and a good deal of the party machinery and property. On the other hand, the leadership of the Old Guard, as it was called, was in the hands of Louis Waldman, chairman of the N. Y. State Executive Committee, Algernon Lee, president of the Rand School, and Abraham Cahan, editor of the *Jewish Daily Forward*.

The dispute between the two wings had been developing for many years. A premonitory disagreement developed at the party convention in 1932 when an abortive effort to unseat Morris Hillquit as chairman of the national executive committee was made. The quarrel came out in the open as

the party group which styled itself the Militants began an aggressive campaign to radicalize the party position. At the Detroit convention in 1934 the nature of the differences could no longer be concealed, for when the leftists introduced a resolution declaring that "they [Socialists] will meet war and the detailed plans for war already mapped out by the war-making arms of the government, by massed resistance" and "if the capitalist system should collapse in a general chaos and confusion which cannot permit of orderly procedure, the Socialist party, whether or not in such a case it is a majority, will not shrink from the responsibility of organizing and maintaining a government under the workers' rules," it was bitterly fought by Messrs. Waldman and Lee and advocated with equal fervor by Norman Thomas, Devere Allen, its reputed author, and Leo Krzycki, chairman of the national executive committee, with the result that it was adopted. Moreover, the left group won the majority of the places on the national executive committee, but the control of the powerful New York State organization remained in the hands of the Old Guard. Socialist strength in the United States, based on members paying dues, was concentrated in New York, New England, New Jersey, and Pennsylvania, with "spots" elsewhere, as in the city of Milwaukee.

When Norman Thomas carried his campaign to the point of a joint debate between himself and Earl Browder, Communist Party leader, on Thanksgiving Eve, 1935, as a means of exploring the possibility of a united front on general and specific issues, the Old Guard immediately declared that the debate was a direct violation of the rules of the party, and moved to expel the left faction. Yet it was made clear during the debate that the left-Socialists and the Communists did not see eye to eye on crucial questions, and Mr. Thomas was at great pains to make clear that he still remained a Socialist in philosophy.

Instead of waiting for formal expulsion, the leftists bolted the party in the fashion mentioned above, and immediately began a campaign of speaking and publishing in an effort to wrest control of the organization from the Old Guard. The organ of the group became the *Socialist Call*, established some months earlier when the *New Leader*, edited by James Oneal, declared for the Old Guard and pursued an anti-leftist and anti-Communist line. The position of the Thomas group may be summarized as a demand that the American Socialists develop a clean, inclusive, aggressive Socialist party, devoted to spreading socialist doctrine, working with the unemployed groups, fighting war and preparations for it, and looking forward to the time when it will be necessary to take power even though a minority. The leftists denied that they were under Communist influence, though they did not reject the prospect of a united front with the Communist Party, and specifically repudiated the charge that they advocate an insurrectionary policy.

On Dec. 28 and 29, 1935, the Thomas group held a convention at Utica, New York, to lay plans for creating a new State organization and launching an aggressive campaign for membership. Eighty-six official delegates were present, 45 from up-State and 41 from New York City. A provisional committee was named, and included the following leaders: Lewis Tonks of Schenectady, Fred J. Smith of Jamestown, Harold Siegel and Brendon Sexton of New York City, Richard Briggs of Rochester, George Brickner of Buffalo, and Alex

Benedict of Geneva. At the same time it was announced that the National Executive Committee would consider the New York State struggle at a meeting early in 1936. The leftists were to present their case at that time, but the Old Guard indicated that it would not do likewise, alleging that the national leaders were in the control of the leftists. As a counter move, the Old Guard reiterated its demand that such national figures as Clarence Senior and Leo Krzycki be forced out of office for violating the party rules. There was, therefore, little prospect that the differences would be composed, and the outlook was for the creation of left- and right-wing Socialist parties in the United States. See COMMUNISM, FASCISM.

SOCIAL PROGRESS, INTERNATIONAL ASSOCIATION FOR. An international association, of which the Association for Labor Legislation is the American section, created in 1925 by amalgamating three former allied organizations, the International Association for Labor Legislation, the International Social Insurance Committee, and the International Association on Unemployment. See LABOR LEGISLATION, AMERICAN ASSOCIATION FOR.

SOCIAL SECURITY ACT. See UNEMPLOYMENT; CHILD WELFARE; LABOR LEGISLATION; UNITED STATES under Congress.

SOCIETY ISLANDS. See OCEANIA, FRENCH ESTABLISHMENTS IN.

SOIL EROSION. See RECLAMATION; SOILS.

SOILS. Land utilization, land classification, valuation, and adaptation, conservation, development, and use of soil and soil moisture resources, soil chemistry, soil fertility, soil physics, soil microbiology, and the dynamic properties of soils affecting tillage, traction, and erosion continued to be among the more important topics receiving special attention by soil investigators.

The movement toward more discriminating use of soils continued. The New York Cornell Experiment Station completed studies of soils in relation to fruit growing, thereby making it possible to eliminate from 80 to 90 per cent of the poor orchard sites. The New Jersey Stations completed the soil survey of the State, together with a summary review of the soil resources to serve as a basis for crop planning and soil adaptation. A national study of adjustment in farming practices based upon soil types in major farming areas was being completed by the U. S. Department of Agriculture and the state agricultural experiment stations.

The National Resources Board appointed a land-planning committee which issued a comprehensive report early in the year dealing with land planning in its immediate as well as in its more remote bearings on human welfare. In line with this report the Federal Government made a substantial beginning in the acquisition of lands unsuitable for farming and broadened the programme to include the purchase of other lands not used in ways consistent with the general welfare.

The U. S. Bureau of Chemistry and Soils continued the nation-wide inventory of the soils and soil fertility resources of the United States. It conducted soil surveys in 74 separate areas distributed over 28 States and two territorial possessions. Detailed surveys aggregating 21,030 square miles and reconnaissance surveys to the extent of 2660 square miles were covered during the year, bringing the total acreage for the detailed survey to nearly 595,000,000 and for the reconnaissance survey to more than 407,000,000. This brought the total area covered by the soil survey to somewhat more than one-half the arable lands of the Nation.

Basic information accumulated relating to the selection and use of domestic peat deposits in place of imported peat products for improving the physical condition of arable mineral soils. The New York Cornell Experiment Station was engaged in a study of the effect of composting on the chemical and biological changes in peat. A study was completed of ionic exchange in peat soils indicating pronounced differences in the percentage base saturation of such soils which was found to be intimately related to soil reaction and calcium content. Studies of potential changes induced by liming suspensions of peat soil indicated that a soil low in oxygen will develop abnormally low potentials when given any treatment that will stimulate the activity of micro-organisms, according to the North Carolina Experiment Station. The New York Cornell Experiment Station completed a study of acidity, antacid buffering, and nutrient content of forest litter in relation to humus and soil.

Soil impairment by erosion and storm run-off continued to be recognized as one of the most important problems confronting American agriculture. On Mar. 25, 1935, the Soil Erosion Service was transferred intact from the U. S. Department of the Interior to the U. S. Department of Agriculture. On March 27 the U. S. Secretary of Agriculture ordered the unification of all U. S. Department of Agriculture activities pertaining to soil erosion under the Soil Erosion Service. This automatically expanded the Service to include the erosion control experiment stations of the U. S. Bureaus of Chemistry and Soils and Agricultural Engineering, the erosion control nurseries of the U. S. Bureau of Plant Industry, and the Emergency Conservation Work camps assigned to the Forest Service for erosion control work. On April 27 an act of Congress was approved providing permanently for the control and prevention of soil erosion and authorizing the incorporation of the Soil Erosion Service into a Soil Conservation Service.

According to the *Report of the Chief of the Soil Conservation Service for 1935*, the erosion control programme under way covered more than 51,500,000 acres of land in 41 States. Within 42 of the demonstration areas erosion control treatment was completed on 598,896 acres, thus safeguarding 3074 farms against soil losses.

Three additional erosion experiment stations were established so that at the end of the year 13 stations were being operated by the Service in cooperation with State agricultural experiment stations to determine the character of soil erosion and to develop preventive measures. In addition three projects were operated on large areas of Federally owned land in New Mexico and Arizona.

The most important survey work of the year was the completion of a nation-wide reconnaissance erosion survey and the presentation of the results in each State by State reports and in erosion maps of the States and the United States. The survey covered every county in the country and included not only the character and distribution of soil erosion, but the degree of slope, prevailing soil type, and present use of the land. Evidence of accelerated or man-induced erosion was found either of frequent occurrence or as a prevailing characteristic within an area comprising 832,083,436 acres. The survey revealed that the greater part of an area of 44,213,887 acres outside of the arid western region had been essentially destroyed by wind or water erosion. A large area was seriously affected by

wind erosion principally in the Middle Western States east of the Rocky Mountains and extending from Texas to North Dakota.

Early in 1935 approximately 274,000,000 trees were being produced for erosion control purposes. Six nurseries were established in the Great Plains and Western States to serve as centres for the study of native vegetation and its use in erosion control.

The Department of Agriculture continued investigations on erosion control in coöperation with the State agricultural experiment stations. The essential character of vegetation as a controlling factor in soil and water losses and as a necessary supplement to terracing continued to stand out prominently.

Strip cropping continued to show marked possibilities for the control of sheet erosion between terraces. The Tennessee Valley Authority (TVA) was coöperating with the agricultural experiment stations of the States within the Valley in a regional study of soil and water conservation and use, which for the first time was answering many of the fundamental questions of soil dynamics, physics, and chemistry involved as a basis for the development of permanent procedure in erosion and run-off control. The Missouri Agricultural Experiment Station completed a study of the physico-chemical properties of soils affecting erosion, indicating that the physical properties of soils affecting permeability and ease of dispersion are paramount factors influencing the erosiveness of soils. The U.S. Bureau of Chemistry and Soils was studying base exchange and related properties of soils from the erosion experiment stations and issued a second report on the physical and chemical characteristics of these soils. The bureau also completed a preliminary study of soil blowing and dust storms, indicating the importance of proper selection of lands for various uses and the wider adoption of superior tillage methods.

The demand for more accurate and specific information regarding fertilizer requirements of crops on soils of known character again increased as land use practices were perfected and put into use. Soil fertility studies by both the U.S. Department of Agriculture and the State agricultural experiment stations continued to concentrate in that direction with reference to the needs of major field, truck, and fruit crops. The Illinois Agricultural Experiment Station summarized the results of long-time experiments on 40 experimental fields indicating an inverse relationship between natural productivity and response to limestone applications. The Indiana Agricultural Experiment Station further developed the use of rapid chemical tests on soils and plants as aids in determining fertilizer needs.

The Vermont Agricultural Experiment Station completed a study of the principal Vermont pasture soils with reference to their content of available potassium and phosphorus and their lime requirements. The Wisconsin Agricultural Experiment Station developed a rapid chemical method for determining the readily available potash of soils, the Colorado Station developed the use of electro dialysis for estimating the availability of phosphates in calcareous soils, and the Pennsylvania Station completed a study of phosphorus penetration and availability in soils, indicating that rock phosphate moves more readily through soils than superphosphate. The California Station completed a study of factors influencing phosphate fixation in soils and the Virginia Truck Station perfected micro-chemi-

cal soil tests in connection with vegetable crop production.

Information continued to accumulate at the State agricultural experiment stations and the U.S. Bureau of Chemistry and Soils on the character, functions, and behavior of soil colloids with particular reference to base exchange phenomena and their influence on availability of soil nutrients to plants, impermeability of semi-arid alkali soils and its correction, the physics and mechanics of soil preparation, and the erosiveness of soils. The Missouri and New Jersey Agricultural Experiment Stations and the U.S. Bureau of Chemistry and Soils continued contributions to the knowledge of soil colloidal behavior with particular reference to the activity of colloidal phosphates, the electrokinetics of hydrous oxides and their ionic exchanges, and liquid intake and swelling by soil colloidal materials.

The Missouri Station developed a method for the quantitative measurement of hardpan formation in sand clay soils. The U.S. Bureau of Chemistry and Soils continued the study of soils and colloids with reference to soil classification and completed a study of the detailed chemical composition of typically representative profiles of the great soil groups the report of which was in press. It was clearly demonstrated that in the great morphological groups the chemical composition of the active component of the soil, the colloid, is characteristic for each group and that for proper control of the soil the treatment must be adapted to the particular characteristics shown. A method of simplification of soil classification was indicated which will assist in the solution of land use problems.

A study of the chemical composition of the soils of the semi-arid areas also was completed, indicating that soils and colloids of these areas owe their characteristic differences primarily to the parent material. A study was nearing completion of the base exchange capacity, neutralization curves, and the maximum acids shown by the colloids of the great soil groups. Information continued to accumulate on the dominating influence of colloids on the capacity of soils for the retention and distribution of moisture and the California Agricultural Experiment Station developed a new and shorter method of measuring the aqueous vapor pressure of soils. The Missouri Agricultural Experiment Station established some of the functional relationships between soil properties and rainfall. The knowledge of the basic relationships between the dynamic properties of cultivated soils and the principles of design of moldboard plows was further strengthened.

The investigation of the distribution of selenium in soils was continued, its presence being demonstrated in serious quantities in both soils and vegetation in seven States. An investigation was completed which threw further light on the effect of soil colloids of varying composition upon the availability of arsenic as affecting plant growth. The results showed that the degree of inhibition of plant growth and yields varies widely with soil type and pointed to the necessity of careful consideration of the quantities of arsenic which may safely be used in insect control. Studies of infertile soils were completed so far as they concern a group of soils derived from serpentine and which cover wide areas in the United States and elsewhere. The results showed that, in addition to the unfavorable physical characteristics shown, these soils contain abnormally large quantities of magnesium, chromium, and nickel.

Bibliography. Advances in the knowledge of the science of soil technology, microbiology, and fertility appear currently in *Soil Science*, published in Baltimore, Md., and in the *Journal of The American Society of Agronomy*, published at Geneva, N. Y. Recent books and bulletins on these subjects are *Further Studies of the Physical and Chemical Characteristics of the Soils from the Erosion Experiment Stations*, (Second Report, U.S. Dept. of Agri. Tech. Bull. 430, Washington, D. C., 1935); *Base Exchange and Related Properties of the Colloids of Soils from the Erosion Experiment Stations*, (U.S. Dept. of Agri. Tech. Bull. 430 and 461, Washington, D. C., 1935).

Bradfield et al., (New York Cornell Station Bull. 592, Ithaca, N. Y., 1934); *Testing Soil for Available Phosphorus*, by C. M. Linsley (Illinois Station Circ. 421, Urbana, Ill., 1934); *The Universal Soil Testing System*, by M. F. Morgan, (Connecticut Station Bull. 372, New Haven, Conn., 1935); and *Farm Soils, Their Management and Fertilization*, by E. L. Worthen, (2d ed., New York, 1935).

SOLOMON ISLANDS. An archipelago in the Pacific, east of New Guinea (Papua). See NEW GUINEA, TERRITORY OF; SOLOMON ISLANDS, BRITISH.

SOLOMON ISLANDS, BRITISH. A British protectorate in the South Pacific, comprising the islands of Guadalcanal, Malaita, Ysabel, San Cristoval, New Georgia, Choiseul, Shortland, Vella

Lavella, Kulambangra, Santa Cruz, Vanikoro, Rennell, and numerous smaller islands (including the Lord Howe atoll). Total land area 11,000 sq. miles; population (1931 census), 94,066 including 478 Europeans. Capital, Tulagi.

The main products were copra, trochus, ivory nuts, timber, green snail shell, and bêche-de-mer. In 1934, exports totaled £111,669; imports, £158,776; revenue amounted to £53,039; expenditure, £56,822. Administration was under a resident commissioner (in 1935, F. N. Ashley) acting under the High Commissioner for the Western Pacific.

SOMALILAND (sô-mă'lê-lând), BRITISH. A British protectorate on the Gulf of Aden in Africa. Area, 68,000 sq. miles; population (estimated), 344,700 of whom 2683 were non-natives. The principal towns were Berbera (capital) with 30,000 (cold season) and 15,000 (hot season) inhabitants; Hargeisa, 20,000 to 15,000; Burao, 10,000; Zeila, 5000.

Trade. Livestock raising is the chief industry. Exclusive of goods in transit and specie, exports for 1934 totaled Rs1,832,397 (rupee averaged \$0.3788 paper for 1934); imports, Rs3,580,851.

Government. During 1934, revenue amounted to £106,169; expenditure, £167,656; public debt, £236,000 (Jan. 1, 1935). The protectorate was under the administration of the Governor and Commander-in-Chief (Major Sir A. S. Lawrance, appointed June 18, 1932).

Following the outbreak of the Italo-Ethiopian war, the British closed the Somaliland-Ethiopian border and mobilized troops to prevent the spread of the fighting across the frontier. See ETHIOPIA under History.

SOMALILAND, FRENCH. A French colony in Africa. Area, 8880 sq. miles; population (1931), 68,965 including 46,687 Somalis, 2992 Arabs, 18,552 Danakils, 499 Hindus, and 628 Europeans. Djibouti (capital), had 11,336 inhabitants in 1931. The coast fisheries, salt mines, and inland trade were the main sources of livelihood. In 1933, total imports were valued at 130,025,000 francs (cotton goods, cattle, sugar, and coal were the main items); total exports, 120,695,000 francs of which a part represented Ethiopian goods brought down by the railway from Addis Ababa (franc averaged \$0.0501 for 1933). Coffee, hides and skins, animal wax, and salt were the chief exports. The local budget for 1933 was balanced at 13,358,100 francs. A governor, assisted by an administrative council, administered the colony.

SOMALILAND, ITALIAN. An Italian colony in East Africa. Area, 194,000 sq. miles; population (1931), 1,010,815 including 1613 Italians and 28 other Europeans. Mogadiscio (capital) had 29,562 inhabitants.

Production and Trade. Agriculture and cattle rearing were the main occupations of the people. Sesame, cotton, resin, oil, kapok, hides, and butter were exported. Imports consisted of iron, machinery, timber, and provisions. In 1933, imports were valued at 58,662,580 lire; exports, 30,272,870 lire (lira averaged \$0.0667 for 1933; \$0.0856 for 1934). Highways extended 6200 miles; railways, 70 miles. There were 23 wireless stations in the colony inclusive of one, at Afgoi, able to communicate directly with Italy.

Government. In the budget for 1934-35, revenue was estimated at 74,472,000 lire (including a state contribution of 48,750,000 lire); expenditure, 71,478,993 lire (including military, 26,754,000 lire). The colony was administered by a governor under the direction of the Italian Minister for the Colo-

nies. Governor, Gen. Rudolfo Graziani (appointed Mar. 6, 1935).

History. Italian Somaliland during 1935 served as the base for the Italian invasion of Ethiopia from the south. Led by General Graziani, the Italian southern army advanced in conjunction with the main offensive launched from the Eritrean border into northern Ethiopia. For details of the campaign, see ETHIOPIA under *History*.

SOUND. See PHYSICS.

SOUTH, UNIVERSITY OF THE. A Protestant Episcopal institution for the higher education of men in Sewanee, Tenn., founded in 1857. The enrollment for the autumn term of 1935 was 234, of whom 212 were registered in the college and 26 in the theological school. The faculty had 29 members. The income from productive funds was \$55,147, while the receipts from all sources totaled \$356,040. The library, which was enlarged during the year, contained 46,796 volumes. President, Benjamin Ficklin Finney, LL.D.

SOUTH AFRICA, UNION OF. A self-governing dominion of the British Commonwealth. Capital, Pretoria; seat of the legislature, Capetown.

Area and Population. With an area of 471,917 square miles, the Union had a population at the 1931 census of 1,828,175 Europeans and 5,409,092 non-Europeans. The area and estimated mean population of the Provinces, by racial divisions, on June 30, 1935, are shown in the accompanying table.

AREA AND POPULATION BY PROVINCES

(Estimated, June 30, 1935)

Province	Area, sq. miles	Europeans	Bantus	Asiatics and mixed
Cape of Good Hope	276,739*	781,900	1,920,900	558,300
Natal	35,284	191,700	1,423,300	182,700
Transvaal	110,450	763,200	1,928,100	55,700
Orange Free State	49,647	207,400	570,400	16,700
Total ...	472,550	1,944,200	5,842,700	813,400

* Excluding Walvis Bay (area, 430 sq. miles), attached to Cape of Good Hope Province but administered by South-West Africa.

Living births of Europeans in 1934 numbered 45,187; deaths, 18,587; marriages (1933), 16,709. Estimated populations of the chief cities in 1932 were: Johannesburg, 355,600; Capetown, 274,000; Durban, 121,000; Pretoria, 90,700; Port Elizabeth, 78,900; Bloemfontein, 52,800; Benoni, 51,300; Germiston, 46,900; East London, 44,800; Pietermaritzburg, 41,200; Boksburg, 41,900; Kimberley, 39,200. Of the 1931 European population, about 55 per cent were of Dutch origin and about 36 per cent British.

Education. Elementary education is compulsory. In November, 1934, there were 9867 state and state-aided primary and secondary schools (4782 for Europeans, with 364,385 pupils; and 4085 for non-Europeans, with 430,201 pupils), and 1314 private schools (293 for Europeans, with 23,131 pupils; and 1021 for non-Europeans, with 41,634 pupils). The five universities and university colleges enrolled an average of 7209 students in 1934.

Production. South Africa has about 10,000,000 acres of arable land, of which some 6,000,000 acres are devoted to cereals. Forests cover about 2,600,000 acres. Yields of the chief crops in the 1934-35 season were: Wheat, 15,343,000 bu.; corn, 64,078,000 bu.; cane sugar, 358,738 short tons; tobacco (European cultivation), 19,401,000 lb.; cotton, 3,951,000 lb.; potatoes (1933-34, European cultivation), 5,475,000 bu. Wool production in 1934 was 113,400 metric tons. The output of creamery butter

in 1933-34 was 18,658,000 lb.; of cheese (factory production), 6,804,000 lb.

Mineral production in 1934 was valued at £50,532,000 (£52,534,000 in 1933), the chief products being: Gold, £44,516,000; coal, £3,154,000; diamonds, £1,438,000; copper, £263,000; asbestos, £203,000; platinum, £140,000; tin, £127,000; coke, £63,000. Mineral output, by quantity, was: Gold, 10,480,000 fine oz.; coal, 13,117,000 short tons; diamonds, 440,000 carats; copper, 9485 short tons; asbestos, 17,594 short tons; platinum, 22,889 troy oz.; tin, 908 short tons; silver, 1,002,000 fine oz.; osmiridium, 5845 troy oz. For the year ended June 30, 1933, manufacturing establishments employed 279,656 persons and produced goods valued at £90,427,000, of which £47,604,000 represented the value added in process of production.

In 1935, 10,776,684 fine oz. of gold, valued at £74,790,876, were mined. Working costs were £42,209,110; the estimated working profit, £32,581,766; dividends declared, £16,437,264.

Foreign Trade. General imports in 1934 were valued at £66,304,000 (£49,318,000 in 1933) and exports of South African products at £57,634,000 (£69,345,000 in 1933). Leading 1934 imports were (in 1000 South African pounds): Machinery, excluding farm and electrical machinery, £5355; cotton manufactures and piece goods, £4567; food and drink, £4264; hardware, £3753; electrical machinery and equipment, £3376; petroleum and products, £2512; iron and steel, £2329. The chief exports (in £1000) were: Gold, £56,131 (including the premium value of £21,529); wool, £8084; diamonds, £2815; fruit, £2590; hides and skins, £1401. Of the total value of 1934 imports, the United Kingdom supplied 48.1 per cent; the United States, 16.9; Germany, 4.8; and Canada, 3.9 per cent. Of the exports, the United Kingdom took 40.6 per cent, France, 10.1, Belgium, 8.9; Germany, 8.4; and Canada, 3.3 per cent.

Imports in 1935 totaled £75,132,000; exports, £73,625,000. United States figures for 1935 showed imports from South Africa of \$3,610,972 (\$2,859,066 in 1934) and exports to South Africa of \$52,864,813 (\$45,350,316 in 1934).

Finance. Budget returns for the year ended Mar. 31, 1935, showed a surplus of £2,969,621. Total revenues were £38,673,096 and expenditures, £35,703,475, as contrasted with £39,497,034 and £33,231,837, respectively, in the previous year. The public debt on Mar. 31, 1934, totaled £274,311,564 (funded, £268,816,037; floating, £5,495,527), compared with £276,100,000 on Mar. 31, 1935 (internal, £119,300,000; external, £156,800,000). The South African pound has the same par value as the pound sterling.

Communications. For the year ended Mar. 31, 1934, the South African railways carried 75,758,000 passengers and 20,423,000 short tons of freight (excluding livestock), the gross receipts totaling £23,706,000. The mileage of government lines on Mar. 31, 1935, was 13,175 miles and in the year ending on that date they showed a net surplus of £3,888,725, after meeting interest payments. There were also about 85,600 miles of highways and an airline connecting Capetown with Croyden, England, by way of Cairo. A Johannesburg-Capetown airline was opened in 1935. During 1934 a total of 1400 vessels of 5,555,812 tons entered South African ports in the overseas trade (1340 ships of 5,002,293 tons in 1933).

Government. Executive power is exercised by the Governor-General, appointed by the King, and the Executive Council, which is responsible to Par-

liament. Parliament consists of a Senate of 40 members (8 appointed by the Governor-General and 32 elected for 10 years) and a House of Assembly of 150 members elected by white male and female suffrage for five years, unless sooner dissolved. Governor-General in 1935, the Earl of Clarendon. Premier and Minister of External Affairs, Gen. J. B. M. Hertzog, who assumed office in 1924. In May, 1935, the Earl of Clarendon's appointment as Governor-General was extended for another term.

HISTORY

The fusion during 1934 of the Nationalist and South African parties in the United South African National party bore fruit in 1935 in the partial liquidation of the struggle between the Boer and British elements of the population. The programme of inter-racial cooperation still met the opposition of the Afrikaner republicans under Dr. D. F. Malan, former Minister of Interior in the Nationalist Government, and of a small die-hard section of Britishers, led by Col. C. F. Stalard, who opposed any weakening of South Africa's ties with Great Britain. But with a representation of 120 out of the 150 seats in the House of Assembly, the United party easily overrode all opposition during the session of Parliament which opened at Capetown on Jan. 11, 1935. The government was further strengthened in March when Tielman Roos, formerly Nationalist leader in the Transvaal and Union Minister of Justice, dissolved his small Central party formed in 1934 and urged his adherents to merge with the United party. On the other hand the Malantes attracted many young Afrikaner voters to their republican movement and were reported to have formed a connection with the Afrikaner Broederbond, a secret society opposing cooperation between the British and Dutch.

The Native Problem. Meanwhile the strong position of the government resulting from the healing of the British-Afrikaner breach enabled it to attack two major problems confronting the Dominion—the incorporation in South Africa of the British protectorates of Basutoland, Bechuanaland, and Swaziland and the relationship between whites and blacks in the Dominion. In May, 1935, the Joint Select Committee of both Houses of the Dominion Parliament issued the draft of two bills embodying the government's proposals for solution of the native problem. The draft was published to provide an opportunity for public discussion of the measures previous to their consideration by Parliament in 1936.

The Native Representation Bill prohibited further registration of natives as voters, but safeguarded the franchise rights of natives who had already registered. In place of direct participation in Union elections, the natives were given the right to choose four white Senators in addition to Senators already selected for their knowledge of native affairs. A native representative council of 22 members also was to be established for the whole Union. In Cape Province two members of the Provincial Council were to be elected by natives. The Native Trust and Land Bill provided for the establishment of a board of trustees to acquire about 14,000,000 acres of land from white owners for gradual settlement by natives.

Both bills were based upon the principle of segregation of the races, although in some respects they offered the natives wider opportunities for self-development than they had previously enjoyed. The native conferences assembled by the

government to discuss the measures expressed strong opposition. They protested that the Representation Bill abolished voting rights conferred on them 80 years before and that the Trust and Land Bill was not far-reaching enough to meet the native requirements for land. The natives received much support in their protests from liberal South Africans, but conservative opinion opposed any liberalization of the bills.

The Protectorates. The question of the transfer of Basutoland, Bechuanaland, and Swaziland to the Union was taken up by Premier Hertzog during his visit to London in May to attend the ceremonies marking the 25th anniversary of King George's reign. J. H. Thomas, the Secretary of State for Dominions, announced in the House of Commons on May 23 that he had discussed the matter fully with General Hertzog in the light of Britain's pledge to make the transfer eventually and of the "constitutional developments during the last few years." It had been agreed, he said, to "extend cooperation between the Union Government and the Administration of the Territories over as wide a field as possible, and in particular in all matters relating to the economic welfare and development of the Territories." General Hertzog stated that he was convinced this cooperation would within a reasonable time lead to the transfer of the territories to the Union in a manner satisfactory to all concerned.

Meanwhile the natives in the three protectorates were seriously alarmed at the prospect of incorporation in the Union. An appeal for continuation of the existing régime was issued to the Parliament and people of Great Britain early in 1935 by Tshekedi Khama, acting chief of Bechuanaland Protectorate. The British administrations in the Protectorates exercised their control indirectly through the native chiefs and protected the natives against white exploitation. Under the Union, the natives appeared destined to share the inferior legal, social, and economic status of the blacks already under South African jurisdiction. In answer to protests from British liberals, the London Government agreed not to transfer the protectorates until both the natives and Parliament had been consulted.

Imperial Defense Issue. With Europe drifting toward another war, the issue of South African participation in a conflict involving Great Britain became of foremost importance. The determination not to fight Britain's battles unless South African interests were believed to be involved was reflected in official and private utterances during the year. Minister of Defense Oswald Pirow stated at the Imperial Press Conference at Capetown on February 5 that "if any government were to attempt rashly to commit us to participation in another overseas war, there would be large scale disturbances and possibly civil war."

Nevertheless the increasingly aggressive character of the German and Italian demands for African colonies, backed by powerful military forces under dictatorial control, aroused the apprehension of South African leaders and enhanced the value of the British connection. While in London Premier Hertzog participated in the confidential discussions on foreign policy and defense held by the Dominion Premiers and British Cabinet Ministers. He returned to Capetown praising the "joyous solidarity" displayed by the British people during the Jubilee ceremonies. During the Anglo-Italian crisis of September and October the South African Government gave Britain full sup-

port at Geneva. Both Premier Hertzog and Minister of Interior Smuts, speaking at a United party congress at Bloemfontein in September, stressed the fact that if South Africa did not support Britain in her time of peril the Dominion would be forced to assume the full burden of self defense.

The Nazi movement in South-West Africa for the transfer of that mandated territory from the Union of South Africa back to Germany brought home to South Africans the dangers threatening from Europe. In November, 1934, the Legislative Council in South-West Africa had petitioned for the incorporation of that territory as the fifth Province of the Union. Hearing on this appeal began before a parliamentary commission in the middle of 1935. On September 3 the Attorney General of the territory submitted documents to the commission indicating that the Nazi party organizations among German residents in South-West Africa, although ordered dissolved in 1934, were continuing the movement for the restoration of German sovereignty with the cooperation of officials in Germany. Other witnesses testified that Jewish residents of the territory were subject to Nazi persecution and boycott. A warning that any attempt to abolish the mandate and incorporate South-West Africa in the Union would meet the opposition of certain League states was given by the Norwegian delegate to the League Assembly in September.

The Economic Situation. Economic activity in the Union continued at a high level during 1935, due primarily to the high price of gold in terms of depreciated currency. The gold mines were crushing increasing quantities of low-grade ore previously unprofitable to work. The resulting demand for labor, machinery, and materials provided a strong stimulus to production and trade in many other lines. The house building and office construction trades were fully occupied and the production of cement, furniture, clothing, footwear, and machinery continued to expand. The coking-coal requirements of the new steel industry improved the coal mining business.

The agricultural situation was satisfactory in the coastal areas of the Cape and Natal Provinces but locust swarms early in the year and a terrible drought in the Northern Transvaal greatly reduced the income of the farmers. The Union Government spent some \$6,000,000 in fighting the locusts. Damage from the drought was infinitely greater. From Pretoria to the Limpopo River the Transvaal for 300 miles along the Rhodesian border was reduced to a desert. Thousands of cattle perished and hundreds of farm families were left dependent upon the bounty of the government.

Fortunately the Union's budget situation continued highly satisfactory, due to the large revenue derived from taxation of the mines. The fiscal year 1934-35 closed with a surplus of £2,870,000 and the budget for 1935-36 provided for an all-round 10 per cent reduction in the income tax and other concessions. At the same time the government was able to carry forward an extensive public works programme, including road construction, irrigation and waterworks development, railway electrification, and harbor improvements.

SOUTH AMERICA. See articles on the various South American countries; **EXPLORATION.**

SOUTH AUSTRALIA. A State of Australia. Area, 380,070 sq. miles; population (Mar. 31, 1935, estimate), 584,858 exclusive of 3579 (1933 census) aboriginals (1988 full-blood and 1591 half-caste). During 1934 there were 8459 births, 5403 deaths, and 4310 marriages. Chief towns (with 1933 census populations): Adelaide, 312,629; Port Pirie, 11,680; Mount Gambier, 5539. In 1934, the 1101 State schools had 90,905 students; the 185 private schools, 14,185 students; the university at Adelaide, 976 undergraduates and 1356 other students.

Production. In 1933-34 wheat (37,305,100 bu.; in 1934-35, 27,455,600 bu.), barley (5,254,280 bu.), oats (2,087,772 bu.), hay (524,191 tons), and vines (9,200,000 gal. of wine and 409,959 cwt. of dried fruits) were the main agricultural products. The 1935 vintage was estimated at 13,200,000 gal. Dairy production (1933-34), in long tons: butter, 8819.5; cheese, 2302; bacon and ham, 3237.3. Livestock in the State (Jan. 1, 1935): 7,885,000 sheep, 346,000 cattle, 109,000 horses, and 86,000 pigs. Wool production (1934) amounted to 79,288,903 lb. Mineral production (1934) was valued at £1,739,478—iron, salt, gypsum, phosphate rock, copper, and gold were the principal minerals. During 1933-34 from the 1733 factories, with 29,486 employees, the value of production was £8,641,477 (Australian £ averaged \$4.0095 for 1934; \$3.8886 for 1935).

Government. For the year ended June 30, 1935, revenue was £11,001,578; expenditure, £10,965,353; public debt, £105,319,536. Executive power was vested in a governor aided by an executive council. Legislative power was vested in a parliament consisting of a legislative council of 20 members and a house of assembly of 46 members. Governor in 1935, Maj.-Gen. Sir W. Dugan; Premier, R. L. Butler. See AUSTRALIA.

History. It was reported during September, 1935, that the drought which had existed in the northern cattle country of South Australia for the past 10 years had broken and pastoralists were looking forward to many good seasons.

SOUTH CAROLINA. Population. On Apr. 1, 1930 (Fifteenth Census), 1,738,765; July 1, 1934 (latest Federal estimate), 1,750,000; 1920 (Census), 1,683,724. Columbia, the capital, had (1930) 51,581 inhabitants, Charleston, 62,265.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod Bu	Value
Cotton	1935	1,341,000	745,000 ^a	\$41,906,000
	1934	1,302,000	681,000 ^a	42,070,000
Corn	1935	1,765,000	25,592,000	16,635,000
	1934	1,730,000	20,760,000	18,892,000
Tobacco ..	1935	97,000	89,725,000 ^b	16,868,000
	1934	72,000	56,880,000 ^b	12,286,000
Oats	1935	407,000	9,768,000	5,177,000
	1934	388,000	6,596,000	4,683,000
Hay (tame) ..	1935	286,000	210,000 ^c	2,982,000
	1934	283,000	201,000 ^c	3,739,000
Sweet potatoes .	1935	59,000	5,192,000	3,375,000
	1934	54,000	4,428,000	3,188,000
Potatoes	1935	18,000	1,926,000	1,444,000
	1934	21,000	2,625,000	2,205,000

^a Bales. ^b Pounds. ^c Tons.

Education. The latest triennial reckoning of the number of inhabitants of school age (from 6 to 20 years) was that made in 1933, which showed a total of 677,587 (344,697 white and 332,890 Negro). There were enrolled in the public schools, in the academic year 1934-35, 488,721 pupils (259,475 white and 229,246 Negro). Of these, there were enrolled in the elementary grades or schools 422,788 (204,580 white and 218,208 Negro); in the high

schools, 65,933 (54,895 white and 11,038 Negro). The year's expenditures for public-school education totaled \$12,162,350, which included \$1,051,227 for service of debt and \$677,662 for capital outlay. Of all expenditure, \$10,606,526 was for white and \$1,555,824 was for Negro schools. The salaries of white teachers, for the year, averaged \$783; of Negro teachers, \$273.

The plans of public instruction that had earlier been put into operation in connection with economic emergency remained in effect in 1935. A grant of \$415,000 of Federal funds was made in order that the term of operation of rural schools might be lengthened. The State undertook to assure the payment of \$75 a month to teachers in such schools in 1935-36, for a duration of seven months.

Legislation. A law was enacted to permit the sale of alcoholic beverages by dealers at retail; they were required to obtain licenses costing \$200 a year. Manufacture was also permitted, and manufacturers and wholesalers were required to hold licenses costing \$200. The State budget totaled some \$7,000,000.

Political and Other Events. In the course of a strike in two cotton mills at Pelzer, pickets opposed the attempts of non-striking employees to enter the mills on the morning of September 2. Shooting occurred at both mills; one woman was killed, and about a score of other persons were wounded. National Guards, which had been stationed at the factories for 35 days, had been removed only a few days before the affray.

Officers. The chief officers of the State, serving in 1935, were: Governor, Olin D. Johnston; Lieutenant-Governor, J. E. Harley; Secretary of State, W. P. Blackwell; Treasurer, E. P. Miller; Attorney-General, John M. Daniel; Comptroller, A. J. Beattie.

Judiciary. Supreme Court: Chief Justice, John G. Stabler; Associate Justices, Jesse F. Carter, Milledge L. Bonham, D. Gordon Baker, E. L. Fishburne.

SOUTH CAROLINA, UNIVERSITY OF. A nonsectarian, State institution of higher education in Columbia, chartered in 1801. Enrollment for the autumn session of 1935 totaled 1345, in the summer session, 399. The faculty numbered 85. The State appropriation amounted to \$185,000 from July 1, 1935, to July 1, 1936. The library contained 130,000 volumes. President, Leonard T. Baker, LL.D.

SOUTH DAKOTA. Population. On Apr. 1, 1930 (Fifteenth Census), 692,849; July 1, 1934 (latest Federal estimate), 705,000; 1920 (Census), 636,547. Sioux Falls (1930), 33,362; Pierre, the capital, 3659.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1935	3,732,000	52,248,000	\$23,512,000
	1934	2,827,000	12,722,000	10,686,000
Wheat	1935	3,744,000	30,822,000	27,973,000
	1934	151,000	598,000	551,000
Hay (tame)	1935	815,000	831,000*	3,698,000
	1934	747,000	374,000*	6,059,000
Oats	1935	2,280,000	67,260,000	14,797,000
	1934	376,000	3,384,000	1,726,000
Barley	1935	2,270,000	43,130,000	13,370,000
	1934	237,000	1,778,000	1,245,000
Potatoes ...	1935	50,000	3,400,000	1,700,000
	1934	43,000	1,290,000	1,109,000
Rye	1935	470,000	7,050,000	2,256,000
	1934	82,000	328,000	220,000

* Tons.

Mineral Production. The chief part of the yearly value of minerals produced in the State came

in 1934, as usual, from a single gold mine, the Homestake, in Lawrence County. The production of gold in 1934, about 97 per cent from the leading mine, totaled 486,119 ounces, as against 512,404 for 1933; by value the yearly totals for the State were \$16,989,858 (1934, at \$34.95 an ounce) and \$13,097,040 (1933, at \$25.56). Some silver (\$64,479 by value for 1934) and a relatively small quantity of coal were produced.

Education. The number of the inhabitants of school age was reported at the end of 1935 as 207,216. In the previous academic year the enrollments of pupils in the public schools totaled 156,244. Of these, 118,940 were in common schools or elementary grades, and 37,304 were in high schools. The year's expenditures for public-school education throughout the State totaled \$10,513,959. While the enrollments ran lower, the reported total of expenditures exceeded that of the preceding year. Salaries of teachers, for the year, averaged \$642.28 in the elementary positions and \$980.70 in the high schools.

Charities and Corrections. The State's central administrative agency dealing with the care and custody of persons was in 1935 the Board of Charities and Corrections, composed of three members. This Board exercised control over the following institutions: State Penitentiary, having some 530 inmates, at Sioux Falls; State Hospital for the Insane, having some 1550 inmates, at Yankton; State Training School (about 140 inmates), at Plankinton; School for the Deaf (about 150), Sioux Falls; School and Home for the Feeble-Minded (about 500), Redfield; School for the Blind (about 50), Gary; State Tubercular Sanatorium (about 175), at Sanator.

Legislation. The Legislature altered the State's system of taxation by creating a tax on retail sales of merchandise, with which it superseded the State's income tax. The change went into effect on July 1.

Political and Other Events. The indigent unemployed of the State, according to the FERA's statement of March 1, received in 1934 direct support to a total cost of \$20,988,563, of which the FERA furnished \$19,621,713 or nearly 94 per cent and local governing units the remainder. The total for 1934 was at the approximate rate of \$30 to each inhabitant of the State and far outran the corresponding rate even for New York; it was 2½ times that for the entire nation. The exceptionally high proportion of destitute people in South Dakota was attributable to the ruin wrought by a succession of years of drought, culminating in the exceptionally severe crop failure of 1934.

Crops in the State were more abundant in 1935, on the other hand, than they had been in a number of years, and the farm value of most of them was relatively high. Nevertheless, at the height of the harvest season there were still 19,000 heads of families on the list of persons receiving direct support. At that time farmers complained that they could not hire help to bring in their crops. Accordingly Governor Berry ordered on July 22 that all grants of public support through the State relief organization be stopped until a sufficient number of unemployed men had come forward to take the harvesting jobs. The State's official census, taken on May 1, 1935, showed the number of inhabitants to have fallen off by 17,767 from the total for 1930; of the 69 counties, 54 shared in the loss of population, Tripp County losing some 2000.

Officers. The chief officers of the State, serving in 1935, were: Governor, Tom Berry; Lieutenant-

Governor, Robert Peterson; Secretary of State, Myrtle Morrison; Auditor, George O'Neill; Treasurer, Frank G. Siewert; Attorney-General, Walter Conway; Commissioner of Schools and Public Lands, Ben Strool; Superintendent of Public Instruction, I. D. Weeks.

Judiciary. Supreme Court: Judges, S. C. Polley, Frederick A. Warren, Everett D. Roberts, Herbert D. Rudolph, Dwight Campbell.

SOUTH DAKOTA, UNIVERSITY OF. A State institution of higher education at Vermilion, founded in 1882. The enrollment for the autumn term of 1935 was 1064 and for the summer session 447. The faculty and staff numbered 143. The operating income for the year was \$308,772.03. President, I. D. Weeks, A.M., LL.D.

SOUTH DAKOTA STATE COLLEGE. A State college of agriculture and mechanic arts at Brookings, founded in 1881. The enrollment for the autumn of 1935 was 916 collegiate and 208 secondary vocational students. The 1935 summer school had an attendance of 155. On the teaching staff were the equivalent of 97 full-time teachers in the collegiate department and eight in the secondary vocational. The income for 1934-35 was \$708,461. The library contained approximately 50,000 volumes and 15,000 pamphlets. President, Charles W. Pugsley, D. Agr.

SOUTHERN CALIFORNIA, UNIVERSITY OF. An institution of higher education for men and women in Los Angeles, Calif., founded in 1879. The enrollment for 1934-35, including summer session and extension classes, was 14,587. In the autumn of 1935 there were 550 members on the faculty. The endowment was \$1,534,000; the income from tuition and fees, \$1,508,500; and other income, \$156,713. The library contained 205,000 volumes. President, Rufus B. von KleinSmid, Sc.D., J.D., LL.D.

SOUTHERN RHODESIA. See RHODESIA, SOUTHERN.

SOUTH GEORGIA; SOUTH ORKNEYS. See FALKLAND ISLANDS

SOUTH-WEST AFRICA. A territory in Africa, administered under a League of Nations mandate as a part of the Union of South Africa. Total area (including the Caprivi Zipfel), 317,725 sq. miles; population (1934 estimate), 266,930 of whom 31,600 were Europeans. Chief towns (with white populations for 1926): Windhoek, the capital, 3809; Luderitz, 1234; Keetmanshoop, 1159; Swakopmund, 1125; Walvis Bay, 662.

Production and Trade. Stock raising was the principal industry. Livestock census (1933): 1,560,477 sheep, 649,816 goats, 628,462 cattle, 64,958 donkeys, and 3285 horses and mules. Diamonds, copper, lead, vanadium, and tin were the chief minerals exported. In 1934, imports were valued at £1,267,865; exports, £1,142,120 of which diamonds (257,813 carats) represented £449,167.

Government. Budget estimates (1934-35): revenue, £448,500; expenditure (including loan expenditure of £150,000), £850,548. The government was under an administrator aided by an executive council, an advisory council, and a legislative council of 18 members (12 elected and 6 appointed by the administrator). Administrator, D. G. Conradie.

History. The Union government at Pretoria appointed a commission during 1935 to examine the question of the resolution presented by the South-West African Assembly, which called for the administration of South-West Africa as a fifth province of the Union of South Africa. The attorney-general of South-West Africa appeared before the commission on Sept. 3, 1935, and pro-

duced a dossier, consisting largely of correspondence between the Nazi group in South-West Africa and authorities in Germany, which indicated that the Nazis were working for a change of mandate and had tried to introduce Nazi methods into the territory. The commission was still in session late in the year. See SOUTH AFRICA, UNION OF, under *History*.

SOVIET CENTRAL ASIA. A region in central Asia, including the territory formerly known as Russian Turkestan. Administratively it comprises the divisions, affiliated with the U.S.S.R. (q.v.), shown in the accompanying table.

<i>Division</i>	<i>Sq. m.</i>	<i>Pop. (1933)</i>	<i>Capital</i>
Tajik S.S.R.	56,608	1,183,100	Stalinabad
Turkmen S.S.R.	189,603	1,268,900	Ashkhabad
Uzbek S.S.R.	74,786	4,918,400	Tashkent
Kara-Kalpak A.S.S.R. .	46,154	338,100	Nukus
Kirghiz A.S.S.R.	75,942	1,108,200	Frunze

Chief towns: Tashkent, 491,000 inhabitants in 1933; Samarkand, 154,600; Andizhan, 85,712; Namangan, 80,784; Ashkhabad, 79,000; Kokand, 75,698; Frunze, 71,680; Stalinabad, 60,000.

SOVIET UNION. See UNION OF SOVIET SOCIALIST REPUBLICS.

SPAIN. A republic of southwestern Europe. Capital, Madrid.

Area and Population. Spain has an area of 194,237 square miles and a population estimated on Jan. 1, 1934, at 24,242,000 (23,563,867 at the 1930 census). Living births in 1934 numbered 637,446; deaths, 388,221; marriages (1933), 148,094; emigrants (1933), 69,330. There were 83,791 foreigners residing in Spain in 1930 (1012 Americans). The chief cities, with their estimated populations on Jan. 1, 1934, were: Barcelona, 1,060,504; Madrid, 1,014,704; Valencia, 341,322; Seville (Sevilla), 235,761; Málaga, 199,021; Zaragoza, 183,960; Bilbao, 171,204; Murcia, 164,044; Granada, 122,679; Córdoba, 112,177.

Education. The 1930 census showed that 57 per cent of the population over 10 years of age were unable to read or write. Enrollment in the primary schools in 1932 was 2,225,533; secondary (1931-32), 105,649, university (1931-32), 33,633. There are 11 universities (at Barcelona, Granada, Madrid, Murcia, Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid, and Zaragoza).

Production. Agriculture is the main occupation. In 1933, 39,973,000 acres, or 32 per cent of the total area, was suitable for cultivation, 57,812,000 acres were under pasture and forests, and 10,621,000 acres were devoted to fruit trees and orchards. Field crops in 1933 were valued at 8,535,000,000 pesetas. Production of the chief crops in 1934 was (in thousands of units): Wheat, 173,600 bu.; rye, 22,176 bu.; barley, 129,161 bu.; oats, 51,969 bu.; potatoes, 167,790 bu.; beet sugar (1934-35), 320 metric tons; olive oil, 66,109 gal.; wine, 539,958 gal. The 1935 wheat crop was estimated at 3,634,000 metric tons; rice (cleaned), 210,000 metric tons. Livestock in 1933 included 3,568,000 cattle, 4,773,000 swine, 19,093,000 sheep, 4,575,000 goats, and 2,758,000 horses, mules, and asses.

Mining and metallurgical production in 1934 was (in 1000 metric tons): Coal, 5337; lignite, 280; iron ore, 1970; pig iron, 344, steel ingots and castings, 509; lead, 73; zinc, 8.2. Coke output for 1933 was 675,000 metric tons, superphosphates, 967,000 tons; copper, 44,000 tons; mercury, 700 tons; manganese ore, 2800 tons; sulphur, 10,000 tons. The value of crude mineral product in 1933 was 469,439,000 pesetas; refined products, 940,705,000 pe-

setas. Cotton and wool textiles, paper, glass, and cement are leading manufactures. The sea fisheries in 1933 yielded 322,400 metric tons of fish, valued at 259,200,000 pesetas. Sardines, tunny, and cod are chief fishes caught.

Foreign Trade. According to preliminary returns, general imports in 1934 were valued at 860,600,000 pesetas (835,508,000 in 1933) and exports at 610,934,000 pesetas (671,174,000 in 1933). Leading 1934 imports were (in 1000 U.S. gold dollars): Chemicals and related products, 20,747; raw and waste cotton, 17,824; machinery, 15,929; automobiles, 10,786; mineral oils, 7901; fresh eggs, 6887. The chief exports were (in 1000 gold dollars): Fresh fruits, 30,118 (oranges, 25,286); olive oil, 8838; chemicals and related products, 8825; wines, 8638; canned and preserved fish, 4409; fresh vegetables, 4373. Of the 1934 imports, the United States supplied 17 per cent; Germany, 11.7; United Kingdom, 10.2; and France, 7.8 per cent. Of the exports, the United Kingdom took 23.2 per cent; France, 15.7; Germany, 11.2; United States, 8.5 per cent.

Imports in 1935 totaled 879,300,000 gold pesetas; exports, 588,200,000 pesetas. United States imports from Spain were \$19,901,073 (\$18,902,806 in 1934); exports to Spain, \$41,340,515 (\$38,029,417 in 1934).

Finance. Actual treasury returns for the calendar year 1934 showed receipts of 4,450,000,000 pesetas (including loans of 566,000,000) and expenditures of 4,477,000,000 pesetas. For 1933 receipts totaled 4,562,000,000 pesetas (loans, 589,000,000) and expenditures 4,426,000,000 pesetas. The total funded debt of the central government on Mar. 31, 1935, was 21,608,317,000 pesetas (21,166,443,400 on Jan. 1, 1934). The peseta (par value \$0.3267 in 1935), exchanged at an average of \$0.0804 in 1932, \$0.1072 in 1933, and \$0.1362 in 1934. In 1935 actual revenues totaled 4,139,000,000 pesetas; cash disbursements, 4,555,500,000 pesetas.

Communications. The Spanish railways, with 10,524 miles of line, carried 111,130,000 passengers and 39,655,000 metric tons of freight (including weight of freight cars) during 1933. Gross receipts for the year were 829,416,000 pesetas. The government appointed a commission to study the problem of railroad transportation in 1935. Highways in 1932 extended 57,627 miles. New airlines between Madrid and Paris, Barcelona and Marseille, Las Palmas and Tenerife, Barcelona and Palma de Mallorca were opened in 1935. The Spanish merchant marine had a gross tonnage of 1,777,700 on June 30, 1935. The net register tonnage of vessels entering the ports in overseas trade with cargo and in ballast in 1934 was 31,612,000 (31,892,000 in 1933).

Government. The Constitution of Dec. 9, 1931, declared a democratic republic of workers of all classes, organized as an integral state but with autonomy for municipalities and certain regions such as Catalonia (q.v.). Legislative power was vested in the people, who exercised it through the unicameral Cortes, or Congress of (455) Deputies, elected for four years. The President was elected for six years conjointly by the Cortes and by an equal number of electors chosen by universal, secret suffrage. He was ineligible for reelection for six years after the end of his term. The President appointed the Premier and also the members of the Premier's cabinet on nomination of the latter. President in 1935, Niceto Alcalá Zamora y Torres, elected Dec. 10, 1931. Premier at the beginning of 1935, Alejandro Lerroux García (Radical).

HISTORY

Strengthened by radical excesses during the abortive revolt of October, 1934, the swing toward conservatism in Spain continued throughout the greater part of 1935. The coalition of Right and Centre groups headed by Premier Alejandro Lerroux, although hindered by internal dissensions and frequent cabinet reorganizations, made substantial progress in their efforts to nullify the radical economic and anti-clerical reforms enacted previous to the conservative victory in the elections of November–December, 1933. During the latter half of the year, however, the Right–Centre coalition was seriously weakened by the opposition of President Alcalá Zamora and by Lerroux's forced withdrawal from the government due to political scandals involving several of his Ministers. Meanwhile the radical parties were reorganizing their forces shattered in the 1934 rebellion. Despite the almost continuous suspension of constitutional guarantees and repressive measures by the government, the opposition groups formed a united front late in the year and prepared to make a new bid for power.

The Lerroux Ministries. The revolt of October, 1934, had been precipitated by the formation of a Ministry under Señor Lerroux which contained three members of the conservative Catholic *Acción Popular* party led by José María Gil Robles (see 1934 YEAR BOOK, p. 662). Lerroux and his moderate republican allies of the Centre were dependent upon the support of the *Acción Popular* for their continuance in office. But Gil Robles' constant pressure for more conservative measures than the Centre was prepared to accept made the course of the cabinet anything but smooth and led to frequent reorganizations. On the other hand, Gil Robles was anxious not to take over full control of the government until the abolition of the anti-clerical provisions of the Constitution had been obtained with Centre support. Although *Acción Popular* had the largest single representation in the Cortes, Gil Robles and his allies on the Right lacked sufficient votes to carry through constitutional amendments without the support of the Centre. (Under the Constitution, amendment of that document required a two-thirds vote of the Cortes during the first four years it was in force. After the expiration of the fourth year, on Dec. 9, 1935, it could be amended by a majority vote.)

The first reorganization of the Lerroux Cabinet occurred immediately prior to the reassembling of the Cortes on Jan. 29, 1935. *Acción Popular* forced the dismissal of the Minister of Education, Filiberto Villalobos, a Free Mason opposed to clericalism in education, but Lerroux filled this and other vacant posts with members of his own Radical party, leaving *Acción Popular* with the same representation as before. Soon afterward, by again threatening to withdraw his support, Gil Robles forced President Alcalá Zamora to approve plans for the reform of the Tribunal of Constitutional Guarantees, a move aimed at the elimination of many Socialist judges. He also forced Lerroux to appoint members of *Acción Popular* as governors of 16 out of the 49 Provinces.

The Lerroux Cabinet again resigned on March 28, as a result of the strong opposition of the *Acción Popular* members to the ministry's leniency in pardoning 20 Leftists implicated in the 1934 revolt. Gil Robles was still unwilling to take over the government, however, and on April 3 Lerroux formed a new cabinet from which the Catholic party was excluded. Advised that *Acción Popular*

would retaliate by overthrowing the government, President Zamora suspended the Cortes for a month. During this period of grace, Premier Lerroux attempted to conciliate the Left groups, who were displaying increasing bitterness at the harsh measures adopted toward the 1934 revolutionists and at the continued repression of their organizations. On April the "state of war" in the Provinces of Madrid, Catalonia, and Asturias was annulled and a modified form of civil law was restored throughout most of the country. Part of the autonomous powers taken from Catalonia after the 1934 revolt were restored and an amnesty was granted political refugees abroad. However the important municipal elections, scheduled for April, were postponed.

Immediately prior to the reassembling of the Cortes in May Premier Lerroux was obliged on May 6 to again reorganize his Cabinet and admit members of the *Acción Popular* in order to avoid defeat. He gave the Catholics five of the seven portfolios demanded by Gil Robles, who entered the ministry for the first time as Minister of War. The new cabinet lineup represented a distinct swing to the Right. The conservative members of the government brought increasing pressure to bear for amendment of the Constitution and for legislation in the interests of the Catholic Church. At the same time the municipal elections were again postponed to the autumn. On June 5 the harsh sentences imposed by the Tribunal of Constitutional Guarantees on the ringleaders of the Catalan independence movement of 1934 reflected the more severe attitude of the new Lerroux Ministry. Luis Companys, former President of the Catalan Generalitat, and six former members of the Catalan executive committee were sentenced to serve 30 years each in prison. On the other hand, the government permitted the reopening of Socialist headquarters in Madrid and several other cities which had been closed since the October revolt.

Before the Cortes adjourned for the summer vacation, the government secured the enactment on August 1 of drastic amendments to the Agrarian Reform Law. Instead of confiscation of the large landed estates for redistribution among the peasantry, the new law guaranteed compensation to the owners on exceedingly favorable terms. Estates of the grandes were to be purchased from government appropriations for resale to the peasants, but the initial appropriation of only 50,000 pesetas for land purchase indicated that the government was in no hurry to carry out its modified programme. The emasculation of their original land reform bill so aroused the Leftist deputies that on July 25 many of them withdrew from the Cortes in protest. The Left was even more angered by the draft proposals for amendment of the Constitution submitted to the Cortes before it adjourned. Revision of 42 out of the 125 articles in the Constitution was recommended, the changes providing particularly for the return of the Jesuits, the reopening of church schools, and the reestablishment of Roman Catholicism as the state religion. The government also attempted, unsuccessfully, to convict former Premier Azaña of complicity in the sale of Portuguese arms to the Asturian Socialists for use in the October, 1934, revolt.

These conservative tendencies provoked widespread political unrest, which was accompanied by increasing violence, especially in Catalonia (q.v.). The government repressed the disorders with

severity. Martial law was reestablished on June 6 and repeatedly extended. On June 9 a complete ban on all political meetings was proclaimed. The censorship of the press was strengthened. Government "administrative commissions" ruled many municipalities in place of the duly elected republican and socialist councillors, who had been ousted for opposing the government. No concession was made to the autonomy demands of the Basque Provinces (q.v.). Troops were sent into Barcelona and other Catalan cities to supersede the police and check radical violence. The ban on political meetings was continued in Catalonia after it was lifted in the rest of Spain. In Barcelona the government restored to the owners extensive properties which had been confiscated under anti-Jesuit legislation, but which the Lerroux Government held to have been merely rented to the Jesuits by a private corporation.

The Chapaprieta Ministry. On September 20 the Lerroux Ministry was again forced to resign through the withdrawal of the Agrarians from the coalition. Departing from his previous policy, President Alcalá Zamora prevented another reorganization of the cabinet under Lerroux by asking Santiago Alba to head a new ministry. Señor Alba, who was a member of Lerroux's Radical party and President of the Cortes, was unable to secure the necessary support. The President then called upon Joaquín Chapaprieta, Finance Minister under Lerroux, who formed another Right-Centre coalition government on September 25. Gil Robles again held the War portfolio and Lerroux assumed charge of the Foreign Office in response to President Alcalá Zamora's demand for an experienced official in this important post (The Anglo-Italian crisis in the Mediterranean then appeared likely to plunge Europe into war.)

Although representing the same party lineup as the preceding Lerroux Ministry, the Chapaprieta Cabinet placed its major emphasis upon financial and budgetary reform. The budget deficit had grown to alarming proportions and the unfavorable trade balance, coupled with other economic factors, threatened to drive Spain off the gold standard. In line with this policy, the government ended most of the repressive measures adopted against the Left parties. Martial law was ended even in Catalonia, the press censorship was modified, and the Left groups were permitted to reopen political headquarters and resume their activities.

Shortly after the Chapaprieta Ministry was formed, there occurred a major political scandal which proved a severe blow to the Right-Centre coalition. Following the action of the government in closing his gambling resort at San Sebastián, Daniel Strauss, a Mexican citizen, charged that he had obtained the concession to operate the place by distributing 2,000,000 pesetas among persons closely affiliated with the government, including the Mayor of Madrid and a nephew and adopted son of Foreign Minister Lerroux. The charges were substantiated in part by a parliamentary commission of inquiry on October 26 and three days later Lerroux and José Rocha, Radical Minister of Education, withdrew from the cabinet to facilitate the investigation. José Martínez de Velasco, Agrarian party leader, succeeded Lerroux at the Foreign Office.

Premier Chapaprieta succeeded in enacting some economy measures, but his effort to balance the budget failed when *Acción Popular* refused to support a programme of heavy taxes on the rich. Withdrawal of the Catholic party's support forced

the resignation of the ministry on December 9.

Portela Valladares Cabinet. Although a devout Catholic and favorably disposed toward the restoration of the Church's privileged position, President Alcala Zamora distrusted the loyalty to the Republic of Gil Robles and his conservative allies. As head of the largest party in the Cortes, Gil Robles was the logical choice for the Premiership, but the President passed him by in favor of Manuel Portela Valladares, an independent and former Minister of Interior. On December 14 the latter formed a largely non-partisan ministry which lacked a majority in the Cortes. The Premier prevented the immediate overthrow of his cabinet only by suspending the sessions of the Cortes until Jan. 31, 1936.

This action, taken with the approval of the President, aroused a storm of criticism, particularly from the extreme Right. Petitions for the impeachment of both the Premier and the President were circulated, but without securing the necessary signatures. Premier Portela on taking over the government had announced that his main purpose was to hold "scrupulously impartial" elections, not later than Mar. 4, 1936. Late in December, however, he announced that he intended to form a government Centre party, which would actively enter the electoral campaign. This move led to the withdrawal of six conservative members of his cabinet and he was obliged to resign on December 30.

Señor Portela was immediately charged by President Alcala Zamora to form another minority government, and he did so the same day. These developments made it certain that a general election would be held early in 1936. For months the rival parties had been girding themselves for a supreme test, which many believed would determine the fate of the Republic. Convinced that another victory of the Right forces under Gil Robles would lead directly to the restoration of the monarchy, the Left Republican parties led by former Premier Azaña had formed a united front with the Socialists under Francisco Largo Caballero and with the powerful Syndicalist and Anarchist organizations. The Socialist-Left Republican coalition had brought about the overthrow of the monarchy in 1931. The Syndicalists and Anarchists, in joining the Left coalition, departed for the first time from their doctrinaire opposition to the use of the ballot and participation in a "bourgeois-capitalist election." The union of these powerful groups obviously presented a strong threat to the Right. To meet this threat a coalition of the conservative Republican and monarchist parties was organized under the leadership of Gil Robles. The stage was set for a showdown between the forces of the Left and the Right early in 1936.

Economic Affairs. The economic situation showed a moderate improvement during the greater part of 1935, but the political developments toward the end of the year aroused new fears of impending disorders and checked the expansion of business activities. The suspension of the Cortes in December made necessary the extension of the 1935 budget by cabinet decree into 1936. Plans for balancing the budget, converting the public debt, and further reorganizing government finances also were abandoned temporarily. Nevertheless, considerable progress was made along these lines during the latter part of the year. Economies under the Lerroux Ministries had saved about 800,000,000 pesetas and more economy measures were taken under Premier Chapaprieta. In September

the government carried through a successful refunding operation, exchanging 305,000,000 pesetas of 6 per cent bonds into new bonds bearing 4 per cent interest. A refunding of outstanding 5 per cent bonds to the 4 per cent rate was then carried through.

These gains were offset in part by the continued decline of the export trade without a compensating reduction of imports, stagnation in the coal mining and cotton textile industries, and the continued financial difficulties of the railways. The adverse trade balance and the decline of the tourist trade made it increasingly difficult to pay for imports. Remittances to the United States, with which Spain had a particularly heavy trade deficit, were delayed more than six months and the importation of United States products was notably hampered by the rulings of the exchange control board. A trade war with France and exchange difficulties with England also hindered Spanish trade.

Foreign Relations. Two chief problems confronted Spain in the sphere of foreign affairs during 1935. The first involved the search for new markets for Spanish exports to relieve unemployment and financial stringency. The second involved the policy to be followed by Spain in the event of another European war.

Negotiations for trade agreements which would open additional markets to Spanish products continued actively throughout the year. Treaties of this nature were concluded with the Netherlands, Poland, and Argentina. Early in the year negotiations were started with France, Britain, and the United States, but slow progress was made. In April the negotiations with France were interrupted by a commercial war, which continued until the conclusion of a new Franco-Spanish commercial treaty on December 21. Negotiations with Britain were broken off early in August due to the application of the British tariff to Spanish products, but were resumed later in the year.

The fact that Italy had become a better customer for Spanish exports than either France or Great Britain placed Spain in a difficult position when the League of Nations in October voted to apply economic sanctions against Italy for her aggression upon Ethiopia (q.v.). The conservative and Fascist elements in Spain were inclined to favor Italy, while the Left groups were bitter in their attacks upon Mussolini's imperialistic adventure in Africa. On September 27 the cabinet decided upon a policy of "absolute neutrality in accordance with our republican Constitution, which renounces war as an instrument of national policy." However the Spanish representative at Geneva gave full support to the principle of collective security under which economic sanctions were applied against Italy. On October 16 Foreign Minister Armando R. Monteiro of Portugal conferred with Foreign Minister Lerroux at Madrid and reached an agreement for joint action in support of the League sanctions.

It was officially denied on November 6 that Spain had reached an understanding with Portugal and Great Britain. In October the British made an official inquiry at Madrid as to the attitude Spain would adopt in case of a naval warfare between Britain and Italy. Apparently no positive commitment had been made by Spain up to the end of 1935, but it was indicated that the question of whether Spanish ports would remain open to British warships would depend entirely upon the decisions of the League of Nations. Meanwhile Spain was proceeding to strengthen her military,

naval, and air forces and was rushing work on the fortification of the strategically important Balearic Islands.

See GREAT BRITAIN, ITALY, and PORTUGAL under *History*.

SPANISH-AMERICAN LITERATURES.

The following résumé of the year's activities must not be taken as exhausting the subject, nor must the omission of any country be held as evidence that it has been non-productive in 1935.

Argentina. Again erudition seems to have outstripped the other genres, although verse and fiction show improvement.

Erudition. Manuel Gálvez, *La Argentina en nuestros libros*; Bernardo González Arrioli, *Mariano Moreno*; Alvaro Melián Lafinur, *La disputa de los siglos*; Rómulo Múñiz, *El Gaucho*; Manuel E. Valentini, *Erasmus y Vives* (brilliant study of Humanism); Ricardo Rojas, *Cervantes* (beautiful analysis of Cervantes as a poet [lyric, dramatic, and epic], matured through many years and written in exile in Ushuaia, the southernmost city in the world); Stuart Cuthbertson, *The Poetry of José Mármol* (careful examination of all the poetic work of an author whose fame hitherto has rested mainly on his novel *Amalia* and his poems of political invective); Ernesto Nelson, *Bibliografía General de las obras referentes a Estados Unidos*.

Drama. Pedro Echagüe, *Amor y Virtud* (verse-drama in three acts, published by the Instituto de Literatura Argentina); Llanderas y Malfatti, *Así es la vida* (Argentine comedy, first played in Madrid, great success).

Poetry. Rafael Alberto Arrieta, *La Ciudad del Bosque* (series of "viñetas platenses," spiritual history of the city of La Plata); Antonio de la Torre, *Globo* (excellent, continues the nature and countryside motives that inspired his earlier works); César Tiempo (Argentine Jewish poet, born in the Ukraine), *Sabatón argentino* (work shows originality of form and content); María Adela Domínguez, *Diez poemas* (small volume of much promise); Amado Villar, *Marimorena* (second book of exquisite verse by author of *Versos con sol y pájaros*).

Fiction. Samuel Glusberg (influential publisher and essayist, writing under the pen-name of Enrique Espinoza), *Ruth y Noemi* (charming book of tales); Carlos María Ocantos, *La princesa está alegre*; Guillermo Perovich, *Angadas en la corrienté* (carefully drawn characters, well told narrations, and good descriptions); Hugo Wast (Gustavo Martínez Zuviría, National Librarian), *Oro* (frankly anti-Semitic novel, concerning the banking supremacy of the Jews throughout the world), and, as a separate pamphlet, the prologue of the foregoing, entitled *Buenos Aires, futura Babilonia*.

Academy. The Academia Argentina de Letras (not the Academia Argentina, Correspondiente de la Española) elected Carlos Ibárguren as its president, to succeed Calixto Oyuela. Other writers elected to membership are: Martín Gil, Bernardo Houssay, Matías G. Sánchez Sorondo, and Francisco Soto y Calvo.

Necrology. Calixto Oyuela, the dean of Argentine writers, whose work over a period of 50 years has been successively admired, disputed, and repudiated by his contemporaries, was the last survivor of a generation of classic-romanticists such as Olegario V. Andrade, Carlos Guido y Spano, and Rafael Obligado, and a staunch defender of pure Castilian style.—Martiniano Leguizamón, writer, historian, and jurist, the first to defend and interpret accurately and artistically "criollismo."

Prizes. The Premios Municipales de Literatura, of the city of Buenos Aires, were awarded as follows: *Poetry*: First Prize, *Marimorena*, Amado Villar; Second Prize, *La Flor en el agua*, María Julia Jijena; Third Prize, *Retablo*, Mary Rega Molina. *Prose*: First Prize, *Cántico y forma*, Enrique Corbellini; Second Prize, *Adán en la Cor-dillera*, José Martínez Jerez; Third Prize, *Vigilia*, J. Anderson Imbert.

Bolivia. In the Academia Boliviana (Correspondiente de la Española), the following were elected: Claudio Pinilla, Fabián Vaca Chávez, and Eduardo Díez de Medina.—Despite the distractions caused by the Chaco war, some interesting works have appeared. Fernando Díez de Medina, *Imagen* (beautiful verse), and *El velero matinal* (interesting essays); Raúl Otero Reiche, *Poemas de sangre y lejanía* (so impressive that the author has been called the "bard of the Chaco epic"); Augusto Guzmán Martínez, *La sima fecunda* (considered by critics the outstanding example of genuine *criollismo*); Fernando Loayza Beltrán, *De Peñas, a 4,000 metros oteando el Altiplano* (charming example of Bolivian folklore).

Chile. The Chilean works that have reached us are primarily verse and erudition.

Erudition. Julio Vicuña Cifuentes (distinguished folklorist, author of several important works, e.g. *He dicho*, and *Estudios de métrica española*), *Alejandro Agunet* (sympathetic account of the life of a great teacher); E. Solar Correa, *La muerte del humanismo en Chile* (a blow at educators who are opposed to cultural studies); Joaquín Navasal y de Mendi, *La Hora de España* (critical study of the history of Spain from the assassination of General Prim through the first two years of the present Republic); Augusto Orrego Luco, *La Patria Vieja* (2 vols. in 4°, published by the University of Chile, as a posthumous tribute to the cultural work of the author, who had completed the manuscript in form to go to press; important not only for knowledge of Hispano-America, but also for understanding of the genesis of the idea of Independence in the former dominions of Spain); Domingo Amunátegui Solar, *Jesuitas, Gobernantes, Militares, y Escritores* (very important work for understanding Chilean history, highly praised by critics), *Las letras chilenas. Hijos ilustres de Chillán* (interesting history of personalities and events, edition of the University of Chile, dedicated to the first centenary of the fourth founding of the City of Chillán, 1835-1935); Julio Saavedra Molina, *Los hexámetros castellanos y en particular los de Rubén Darío* (detailed study of Darío's efforts at writing hexameters on the model of the Latin).

Poetry. Raúl Silva Castro, *Obras desconocidas de Rubén Darío* (presenting much new material of great importance); Eduardo Anguita and Volodia Teitelboim, *Antología de poesía chilena nueva*, Carlos Préndez Saldías, *Alamos nuevos* (critics say this is his best work); Pablo Neruda, *Tres poemas materiales*.

The *Boletín de la Academia Chilena* continues to publish its lexicographical studies concerning "Americanisms."

Colombia. The Director of the Biblioteca Nacional, upon learning of these annual articles in the NEW INTERNATIONAL YEAR BOOK, sent in 20 volumes of recent works. Two of these (the 3d ed. of Tomo I of *Elocuencia colombiana*, edited by Roberto Ramírez B. in 1928—a fine chronological selection of important orations; and *Jenny*, a Colombian novel by Luis Alberto Castellanos, 1932)

would not ordinarily appear in our account limited to the last months of 1934 and the first 10 months of 1935. One of the gifts is a magnificent, profusely illustrated homage presented to President Enrique Olaya Herrera at the close of his fruitful presidential term, 1930-34, entitled *Administración Olaya Herrera*.

Erudition. Rafael Maya, *Alabanzas del hombre y de la tierra*; José Alfredo Guzmán, *Visiones indo-americanas* (author having traveled much through Indo-America, these 28 essays are descriptions of scenes as he envisions them from the view point of the aborigines); Miguel Antonio Caro (Edición oficial, dirigida por Víctor E. Caro), *Obras Completas*, vols. v and vi; and *Obras poéticas*, vols. i, ii, and iii (these volumes of the great humanist are published by the government); Academia Nacional de Bellas Artes, *Iniciación de una Guía de Arte Colombiano* (302 quarto pages, 83 full-page plates *hors texte*); José J. Ortega T., *Historia de la literatura colombiana* (compendious history of Colombian literature 1538-1810); Gustavo Arboleda, *Manuel de Historia de Colombia* (from the discovery down to late in 1934); *Cariores prosistas amenos* (Biblioteca aldeana de Colombia); Eduardo López, *Temas nacionales*, Enciclopedia Comercial e Histórica de Colombia, Tomo IV, Primera entrega, A-LL (useful reference book); Leonardo Tascón, *Quechuisms usados en Colombia* (posthumous publication of an important philological study of the Quechua language); Luis Alberto Acuña, *El arte de los indios colombianos—Ensayo crítico e histórico*; Miguel Aguilera, *Los Caballos del Libertador* and *El Sobrino Calavera* (two delightful "trivial" notes about Bolívar).

Poetry. Pedro Vélez Racero, *Poesías* (prologue by J. and F. de la Vega—delightful study of the brilliant Colombian statesman and poet, posthumous edition of his works); Arturo Camacho Ramírez, *Espejo de naufragios*; Ismael Enrique Arciniegas, *Los Trojes de José María de Heredia* (careful translation into Spanish sonnet form of the entire 118 sonnets of Heredia); Germán Pardo García, *Los cánticos* (de luxe edition in large quarto of 21 beautiful sonnets and 5 poems of varied form).

Fiction. Eduardo Zalamea Borda, *4 años a bordo de mí mismo—diario de los 5 sentidos*; J. A. Osorio Lizarazo, *La cosecha* and *El criminal* (the latter a study of the growth of a criminal idea in a man's mind).

The *Academia Colombiana*, Correspondiente de la Española, held a special session in honor of the tercentenary of Lope de Vega, Antonio Gómez Restrepo being the principal speaker. Vice the late Carlos Martínez Silva, the Academy received José Vicente Castro Silva, canon of the Iglesia Metropolitana de Bogotá and regent of the Colegio del Rosario; and vice José Vicente Concha, it received Luis López de Mesa, Minister of National Education, physician, novelist, sociologist, and historian.

Costa Rica. Rogelio Sotela Bonilla, *Rimas Serenas*; Roberto Brenes Mesén, *En busca del Grial—Poemas*.

Cuba. The following materials have come to hand. Juan J. Remos y Rubio, *Tendencias de la Narración Imaginativa en Cuba* (valuable contribution to our knowledge of fiction in Cuban literature); José Antonio Ramos, *Panorama de la Literatura Norteamericana, 1600-1935* (sympathetic study of our American literature, by a forerunner; should be read by many of us); *Homenaje a Enrique José Varona en el cincuentenario de su*

primer curso de filosofía, 1880-1930 (this volume of numerous studies is a magnificent tribute to Varona); Fernando Ortiz, *De la música afro-cubana—un estímulo para su estudio*, and *La "clave" xilofónica de la música cubana* (two interesting continuations of his ethnographic studies); José María Chacón y Calvo, *Aviraneta, pacificador* (documented study of a little-known phase of Aviraneta's life), *El Padre Varela y la Autonomía Colonial* (new documentary evidence concerning Varela), and *Apuntes de la guerra de Cuba del General Salamanca* (inedited MS., now critically edited with notes and a preliminary study); Ramiro Guerra y Sánchez, *La expansión territorial de los Estados Unidos, a expensas de España y de los países hispanoamericanos* (the title indicates the nature of the work, and Americans should read it). The *Universidad de la Habana*, a bi-monthly magazine, is a very important addition to our working materials. It carries valuable articles, such as *Craticismo y colonización* by J. M. Chacón y Calvo; *Primeras relaciones entre Cuba y los Estados Unidos*, by Herminio Portell Vilá (which we Americans ought to read carefully). Another valuable aid to our knowledge of Cuba is *La Revista bimestre cubana*, directed by Fernando Ortiz. In recent numbers one finds two articles by Fernando Ortiz, *Cómo eran los indocubanos* and *La holgazanería de los indios*; a *Bibliografía de la Avellaneda*, by Edith L. Kelly; also five articles concerning José Agustín Caballero y Rodríguez.

Cuba lost through death her academician and diplomat, Manuel Márquez Sterling, Ambassador of Cuba to the United States.

The *Academia Cubana* (Correspondiente de la Española) elected to fill vacancies José Ignacio Rivero, Medardo Vitier, Agustín Acosta, Juan J. Remos, Félix Lizaso, and Enrique Gaspar Rodríguez.

Dominican Republic. The Academia Dominicana de la Historia received Emilio Rodríguez Demorizi—Max Henríquez Ureña, *Panorama de la República Dominicana* (several illustrations, brief sketches of the geography, history, and intellectual life of the Dominican Republic, as well as the official words and music of the National Hymn); Manuel Cabral (youngest and most celebrated of Dominican poets), *12 Poemas Negros*.

On February 6, the Academy and the country suffered a great loss through the death, in Santiago de Cuba, of Dr. Francisco Henríquez y Carvajal, man of letters, orator, teacher, statesman, physician (graduated from the Faculties of Paris, Habana, and Santo Domingo), diplomat, Secretary of State 1899-1902, and President of the Dominican Republic in 1916. He was born in Santo Domingo, Jan. 14, 1859, was the brother of Federico Henríquez y Carvajal (ex-Rector of the University and Director of the Academia de la Historia), and father of Max Henríquez Ureña and Pedro Henríquez Ureña.

Ecuador. Classical scholarship is still in vogue in Ecuador, as witness bi-millennial activities concerning Vergil and Horace: *La Medalla "Honorable Vázquez"* y el libro "*Virgilio, el Poeta, y su Misión Providencial*"; Aurelio Espinosa Polít, S.J., *El bimilenario de Horacio*, and *Sófocles—Edipo Rey* (in Castilian verse).

Alejandro Andrade Coello, *Eloy Alfaro, El ocazo de los conquistadores, Los Genios, Del Quito Antiguo, y A través de los libros*; Roberto Agramonte, *El panorama cultural de Montalvo*.

Guatemala. *Publicaciones de la Academia Guatemalteca*, iii and iv, contain some important

studies.—Guillermo F. Hall, *El Desarrollo de la Literatura Inglesa y Traducciones del Inglés*; A. J. Irisarri, *Cuestiones filológicas*; Salvador Falla, *Las palabras* (semantic study) and *Sobre moral*; David Vela, *El Mito de Colón*; the continuation of the reprinting of the long out-of-print *Cuestiones Filológicas* of Antonio José Irisarri; and the reproduction of the pamphlet, printed in Spain, entitled *Don Pedro de Liévana*, by A. R. Rodríguez Moñino (Liévana being the first poet to write Spanish verse in Guatemala).—Pedro Pérez Valenzuela, in *La Nueva Guatemala*, gives a documented history of the city of Nueva Guatemala.—The Government of Guatemala has decreed the publication, at the expense of the State, of all the works of Santiago Arguello, member of the Academia Guatemalteca. The following volumes have already appeared within the last year: *El Divino Platón* (2 vols., already out of print); *El Libro de los Apólogos y otras cosas Espirituales*; *La Magia de Leonardo de Vinci*; *Mi mensaje a la Juventud y otras Orientaciones* (2d edition); *Modernismo y Modernistas* (2 vols.); and *Poesías Escogidas y Poesías Nuevas*.

The *Academia Guatemalteca* (Correspondiente de la Española) lost its nonagenarian Director, Salvador Falla, ex-Rector of the University and ex-President of the Sociedad de Geografía e Historia.

Mexico. Poets and scholars have been more active than writers of other types.

Poetry. José Muñoz Cota, *Romances de la hoz y del martillo*, and *Canciones de la Vida Futura* (poems of diaphanous simplicity, preaching international proletarian fraternity); Enrique Carniado, *Alma Párvula*; Antonio Castro Leal, *Las Cien Mejores Poesías (Líricas) Mexicanas* (new and improved edition—fine panorama of Mexican lyric verse); Ramón López Velarde, *Poemas escogidos—con un estudio de Xavier Villaurrutia*; Adela Palacios, *Cuadros Escolares*, (poems with a fine flavor).

Drama. Francisco Navarro published *El mundo sin deseo*, a volume of six plays, the most unusual one of which gave its title to the volume.

Fiction. Mauricio Magdaleno produced *Campo Celis*, a novel of country life in Zacatecas, Jalisco, and Aguascalientes, showing types masterfully sketched.

Erudition. Erudition outran the other branches and we list: Luis Rosado Vega, *El alma misteriosa del Mayab* (preserves the folklore of aboriginal Yucatan); Salvador Novo, *Continente vacío: viaje a Sudamérica* (charming book of travel, quite different from the average run); Xavier Icaza, *La Revolución Mexicana y la Literatura*; Archivo general de la nación, *Documentos Inéditos relativos a Hernán Cortés y su Familia* (very important sources); Doctor Atl, *Un Hombre más allá del Universo* (original philosophical conceptions in novelistic garb); Antonio Cortés, *Hierros Forjados* (very important, highly illustrated study of wrought iron art, in the Colección del Museo Nacional de Arqueología, Historia y Etnografía); Secretaría de Educación Pública, *Guía Bibliográfica de la Historia de México, 1: Época precortesiana*; Genaro Estrada, *Algunos Papeles para la Historia de las Bellas Artes en México* (very important and suggestive); Alfonso Reyes, *Minuta* (poetic game for the gourmet); Francisco L. Urquiza, *Recuerdo que . . .* (souvenirs of one who served widely), and *Carranza* (fine, short biography written by a friend); Bernardo Ortiz de Montellano, *La Poesía Indígena de México* (penetrates the

sensibility of the unknown bards of the aboriginal tribes); Dr. Emilio Valton, *Impresos Mexicanos del Siglo XVI—Incunables americanos* (treats the origins of printing in America); José María Vigil, *Lope de Vega—Impresiones Literarias* (official contribution of the Mexican Government to the tercentenary of Lope); José de J. Núñez y Domínguez, *Al margen de la historia*, (delightful sidelights on many personages and events); Ezequiel A. Chávez, *El Primero de los Grandes Educadores de la América: Fray Pedro de Gant. The Academia Mejicana*. (Correspondiente de la Española) seated member-elect Carlos Díaz Dufoo.

Peru. Peru celebrated with due ceremony the 400th anniversary of the founding of Lima by Pizarro, January 18, and, January 25, laid the corner stone of a monument to Ricardo Palma. On August 27 was held a great ceremony for the tercentenary of the death of Lope de Vega.

The following publications have come to hand Ventura García Calderón, *Un Congreso de la Lengua Castellana*; José de la Riva-Aguero, *El Primer Alcalde de Lima, Nicolás de Ribera el Viejo, y su Posteridad* (illustrated with facsimiles and photographs), and *Discursos Académicos*; Alberto Guillén, *La leyenda Patria* (lyric evocation of Peruvian history for children); Clemente Palma, *Don Alonso Henríquez de Guzmán y el primer poema sobre la conquista de América*, and X. Y. Z. (a wildly fanciful novel with scene laid in the United States).

The *Academia Peruana* (Correspondiente de la Española) seated member-elect Enrique A. Carrillo, and elected Manuel Vicente Villarín to the chair left vacant upon the death of Emilio Gutiérrez de Quintanilla, the last survivor of the group which established the Peruvian Academy about 50 years ago, novelist, critic, historian, whose contemporaries called him the "Menéndez y Pelayo del Perú."

Peru's greatest loss, however, came through the death of Angélica Palma, gifted daughter of Ricardo Palma. Born in Lima, Oct. 25, 1885, her formal studies were made in Lima in the school of Doña Teresa González de Fanning. The rest of her training was received at the hands of her father. She herself had said that the most interesting thing in her life was having been the secretary and constant companion of her father, when bad health had forced him to retire to Miraflores, in the outskirts of Lima.

In 1918, Angélica Palma published her first novels, *Vencida* and *Morbus aureus*, under the pseudonym of "Marianela." *Por senda propia* was published in Lima in 1921. In that same year, in an international literary competition held in Buenos Aires, her novel *Colonaje romántico* won the prize, and appeared in 1923. In 1924, in Lima, there was a literary competition to commemorate the centenary of the battle of Ayacucho. Her historical novel *Tiempos de la patria vieja* won first prize, and was published in 1926. In that same year she published *Uno de tantos*, and a pamphlet, *Ricardo Palma*, in the collection *Figuras de la raza*. For the centenary of her father's birth she published, in 1933, an illustrated volume entitled *Ricardo Palma*, and giving a detailed account of his life.

For a number of years she was in Madrid, while she supervised the printing of the definitive edition of her father's *Tradiciones Peruanas*, in six large volumes. In 1923 she attended the Congreso Teresiano, held in Madrid. In 1926 she was Peruv-

an delegate to the Inter-American Congress of Women, in Panama, and in 1929, one of Peru's delegates to the Exposition at Seville, and later in the Congress of History at Barcelona.

She was Corresponding Member of the Real Academia de Buenas Letras de Barcelona, and of the Real Academia Hispano-Americana de Cadiz. In 1924, Alfonso XIII made her a Knight Commander of the Civil Order of Alfonso XII.

Angélica Palma died in Rosario (Argentina) Sept. 6, 1935, on a lecture tour as the guest of the Argentine Republic, which insisted that the funeral be at the expense of the State.

Uruguay. The pantheistic author, Montiel Ballesteros, wrote *Pasión*, his latest novel.—Fernando Nébel produced *Dos amores*, new poems filled with a Vergilian feeling for nature.

Venezuela. Antonio Spinetti Dini wrote *La palabra al viento*, interesting verse.

SPANISH LITERATURE. Again, as in the past two years, erudition during 1935 has apparently outrun any of the creative forms of literature, with drama surging ahead of fiction for second place.

Drama. The older generation continues to prove that it can write dramas that the public will welcome: J. Benavente, *Memorias de un Madrileño*, *La novia de nieve*, "No juguéis con esas cosas," and *Cualquiera lo sabe*; S. y J. Álvarez Quintero, *Para mal, el mío*, *Martes*, 13, *La comiquilla*, and *La inglesa sevillana*; Eduardo Marquina, *La Dorotea* (inspired by Lope de Vega's work of the same name), *Lo que Dios no perdona*, and *En el nombre del Padre*; Carlos Arniches, *La tragedia del peléle*; Pedro Muñoz Seca, *El Rey negro*, *El gran ciudadano*, *Papeles*, *¡Cataplúm!*, and *¡Solal!*; Luis de Vargas, *Doña Mariquita*; Enrique Suárez de Deza, *Adiós, muchachos*, *La millona*, and *Mamá Inés*; Francisco Serrano Anguita, *Capercucita gris*; Federico García Lorca, *Bodas de sangre*, and *Yerma*; and José María Pemán, *Noche de levante en calma*, *Cisneros*, and *Cuando las Cortes de Cádiz*.—Others that should be mentioned are: José de Lucio, *Pepa la trueno*; Francisco Ramos de Castro and Anselmo Carreño, *Sevilyyí*.—The first prize (for new authors) in the competition of the Sociedad Artística Muñoz Seca was won by Fernando de Tena Dávila and González Galocha with their *Guñol de Hogar*.

Fiction. Pio Baroja offers two new books, completing his *Memorias de un hombre de acción*, viz. *Crónica escandalosa* and *Desde el principio hasta el fin*.—Ricardo Baroja wrote *La nao "Capitana"*, with illustrations by the author.—José Más wrote *El rebaño hambriento en la tierra feras*; Eduardo Zamacois, *La antorcha apagada*; and Francisco Agustín, *Justo, el crítico*.—Other novelists who should be mentioned are: Xavier Cabello Lapiedra, *La l'ercidita*; Tomás Borrás, *Casi verdad, casi mentira*; Benjamín Jarnés, *Libro de Esther*.

Poetry. While there is not a great quantity of verse, such as we have is good. José María Uncal, *Diez velas sobre el Mar*; José María Gutiérrez Ballesteros, *Sal y Sol de Andalucía*; José Carlos de Luna, *El Cristo de los gitanos*; Dr. José Goyanes, *Los Atlantes*; María Enriqueta, *Poemas del campo*; J. M. Pemán, *Señorita del Mar*; Adela de Medina, *La Buenaventura*.

Erudition. Again scholarship has flourished. Francisco Rodríguez Marín published his critical, annotated edition of Cervantes' *El Viaje al Parnaso* and the *Epistolario Menéndez y Pelayo*—*Rodríguez Marín*; Cannon by José Solano (in

the Collection of The Hispanic Society of America); Juan Valera, *Obras Completas*, Tomo 53; Pelayo Quintero Atauri, *Pintores Jerezanos en el Museo de Bellas Artes de Cádiz*, and *Imitaciones y repeticiones de cuadros*; Narciso Alonso Cortés, *Historia de la literatura española*, and *Artículos histórico-literarios*; Antonio Soto, *El Madrid de la Primera República* (awarded the prize in the 1934 competition of the Ayuntamiento of Madrid); Manuel Azafia, *La invención del "Quijote" y otros ensayos*, and *En el poder y en la oposición*, 2 vols.; Estanislao Maestre, *Homenaje a Pereda*; Padre José Sanchis Civera, *Vida íntima de los Valencianos en la época foral*; Conde de Romanones, *Amadeo de Saboya*, *el Rey efímero*; Casto del Rivero, *Historia de la Imprenta en Madrid* (first prize in the competition of the Ayuntamiento de Madrid); Salvador de Madariaga, *Anarquía o Jerarquía*; Leopoldo Eijo Garay, *La persona jurídica, su concepto filosófico y derechos fundamentales que debe respetar en ella el Estado*; Luciano de Taxonera, *Antonio Maura*; Rafael Láinez Alcalá, *Pedro Berruguete, pintor de Castilla* (excellent study that won the Premio Nacional de Literatura de 1934); César Silió, *Don Alvaro de Luna y su tiempo*; Benjamín Jarnés, *Castelar, hombre de Sinaí*; Pio Baroja, *Vitrina pintoresca*; Juan de Contreras, *Historia del arte hispánico*, vol. ii (covers the Gothic in Spain and has 600 exquisite illustrations); the *Diccionario Catalá-Valenciá-Baleár* has reached fascicle 33 of vol. iii; Ramón Menéndez Pidal and E. Varón Vallejo, *Historia troyana en prosa y en verso, texto de hacia 1270*; Justo Pérez de Úrbel, *Los monjes españoles en la Edad Media*, 2 vols.; Julián Paz, *Documentos relativos a España existentes en los Archivos Nacionales de París*; Salvador Bermúdez de Castro, Marqués de Lema, *Don Pedro José Pidal, Marqués de Pidal, Primer Presidente de la Academia de Ciencias Morales y Políticas*, and *Don Salvador Bermúdez de Castro y Díez y el Romanticismo*; Enrique Díez-Canedo, *Unidad y diversidad de las letras hispánicas*; Tomás Navarro Tomás, *El acento castellano*; Ramiro de Maeztu, *La brevedad de la vida en nuestra poesía lírica*.

Lope de Vega Tercentenary. Because of the 300th anniversary of the death of Lope de Vega, Aug. 27, 1635, numerous celebrations were held throughout Spain and the three Americas. Many special studies appeared, and revivals of his plays were produced, by students and professionals, outstanding among the latter being those by Josefina Díaz de Artigas and Rafael Calvo, in the Teatro Eslava, and by Margarita Xirgu and Enrique Borrás, in the Teatro Español.

The Spanish Academy, owing to the number of deaths in recent years, has been unusually active in receptions and elections. Reception—Miguel Artigas y Ferrando; Salvador Bermúdez de Castro, Marqués de Lema; Pio Baroja; Tomás Navarro Tomás; Ramiro de Maeztu; and Enrique Díez-Canedo. Elections—Blas Cabrera and Wenceslao Fernández Flórez.—*The Spanish Academy* awarded the following prizes: the Academy's Biennial Prize—for the *Vocabulario de las obras de don Leandro Fernández de Moratín* to Federico Ruiz Morcuende; Fastenrath, for 1935, to José María Morón, for the volume of verse *Minero de estrellas*; Piquer, for 1935, to the comedy in three acts *Madre Alegría*, by Luis Fernández de Sevilla and Rafael Sepúlveda; Castillo de Chirel, to Juan López Núñez, for his *Vida y costumbres de antaño*; Luca de Tena, for 1935, to the journalist Pedro Mourlane Michelena.

Necrology. Losses have again been serious in the field of belles-lettres. Joaquín Hazafias y La Rúa, Rector of the Universidad de Sevilla, author of notable works of erudition.—Narciso Díaz de Escovar, of Málaga, known as the *poeta de los cantares*.—The Conde de las Navas, trained as a lawyer (Licenciante in Civil and Canon Law), and as an archivist, palæographer, and librarian in the School of Diplomatics, early won a chair in palæography in the University of Madrid (which he held until he retired in 1925); in 1893 he was appointed majordomo and Chief Librarian by his Majesty Alfonso XIII, which post he held until the advent of the Republic; in 1924 he became a member of the then Royal Spanish Academy; his publications are of three classes: creative (novels and tales), professional (concerning libraries and archives), and sundry (*Los vinos españoles, Aceite de olivas, El chocolate*, all thoroughly documented).

Manuel Bartolomé Cossío, the great art critic and leader in education, died Sept. 2, 1935. He was born in Haro (Logroño), Spain, in 1858. A bachelor in liberal arts, and Doctor of Jurisprudence, he was one of the favorite pupils of Francisco Giner de los Ríos, Founder and Director of the Institución Libre de Enseñanza in Madrid. Upon the death of Giner de los Ríos, Cossío became Director and continued his master's work until his own death. He became Director of the Museo Pedagógico Nacional in Madrid, and somewhat later the first occupant of the Chair of Pedagogy in the University of Madrid, both of which posts he held until his statutory retirement from the former post (Feb. 22, 1929), upon which occasion the government created for him the title of Honorary Director. In 1904 he was Spain's educational delegate to the Saint Louis Exposition, and ever thereafter he represented Spain in most of the international educational congresses held in Europe and the Americas. Despite his pedagogical duties, he found time for profound investigations concerning the great Spanish painter El Greco. In 1908, he published the results in two volumes entitled *El Greco*, and the critics have acclaimed it the most authoritative work that has appeared on the subject. He always abstained from politics, but when the Republic came into being he was offered the Presidency. He declined the honor, but devoted himself to reforming the educational work of Spain, being really the heart and soul thereof. In April, 1934, the Republic proclaimed him its first "Ciudadano de Honor." The great surgeon, philosopher, and littérateur, Gregorio Marañón, said of him: "It is difficult to tell all that he has been. But it can be asserted that today the death of no other person would cause so many noble Spaniards to weep, as his has."

SPITSBERGEN. See SVALBARD.

SPORTS. Articles covering the activities in the various sports during 1935 will be found under such titles as, ATHLETICS; BASEBALL; FOOTBALL; GOLF; POLO; TENNIS; YACHTING; ETC.

STANFORD UNIVERSITY. A privately endowed institution of higher education, nonsectarian and coeducational, founded in Palo Alto, Calif., in 1885 and opened in 1891 in memory of Leland Stanford, Jr. On the campus are the schools of biological sciences, business, education, engineering, hygiene and physical education, law, physical sciences, and social sciences. The school of medicine is in San Francisco, and the Hopkins marine station at Pacific Grove. The total enrollment in 1934-35 was 4000. The 1935 summer session had an

attendance of 719, while the enrollment for the autumn session was 3848. The faculty numbered 734, including 185 teaching assistants. The endowment funds amounted to \$32,005,238; the budget income for the year was \$2,728,585 plus gifts of \$216,152. There were 635,873 volumes in the libraries. President, Ray Lyman Wilbur, M.D., LL.D., Sc.D.

STATE PLANNING. The State Planning movement continued to make notable progress during 1935. The enactment of laws by 32 State Legislatures creating a State Planning Board and establishing state planning as a permanent function of government is convincing indication of the trend toward planning for the conservation and more appropriate utilization of State and national resources.

State Planning Boards have been established in all States except Louisiana and Delaware. (See National Resources Committee Circular II revised, for membership of Districts and State Planning Boards.) In addition, the National Capital Park and Planning Commission in the District of Columbia has functioned actively since its creation in 1926, the Territory of Alaska has enacted a law creating a State Planning Board and the Puerto Rico Reconstruction Administration has established an active Division of Planning to co-ordinate the planning, research, and related activities of all its divisions.

Practically all State Planning Boards started work with virtually no funds or staff, but through the provisions of the CWA followed by the FERA and WPA, funds were made available for employment of white collar unemployed technical, clerical, and stenographic help which, under the general guidance of the consultant furnished by the National Resources Board, organized and conducted programmes of surveys and research and planning. In addition, the State Planning Boards obtained assistance in the form of funds, personnel, office space and supplies from a variety of sources such as Governor's contingent funds, universities, and State bureaus. Technical members of subcommittees of many State Planning Boards also made valuable contributions through advice and the preparation of special reports.

Programmes of work undertaken by the State Planning Boards represent a variety of approaches and studies which were encouraged by the National Planning Board and its successors, recognizing the value of experiment in these early stages of development. No fixed uniform programme was recommended but instead a wide range of types of surveys, research, and study were suggested from time to time in various circulars to consultants and state planning boards.

Universities and State bureaus, as well as privately financed agencies, for many years have been directing attention to the collection of basic data and making studies of problems confronting the State and local governments. The inauguration of State planning presented an excellent opportunity to unify and co-ordinate these endeavors with its activities of collecting additional needed basic data and for initiating or accelerating studies of mutual value to all concerned.

Especially significant is the nation-wide inventory of available State and local public works projects conducted jointly by the staffs of the State Planning Boards, the State PWA offices and the State Relief offices. Several of the State Planning Boards have materially assisted the State Relief Directors in formulating programmes of work relief projects. Equally important are

the surveys and studies relating to national land utilization programmes and the conservation and development of water and other natural resources on a national scale, as well as studies of population, social and economic trends, transportation, recreation, housing, government, reorganization, etc.

The seriousness and thoroughness with which these State boards have undertaken their tasks is evidenced by the large number, variety and uniformly high quality of studies and reports they have prepared which have been of definitely practical value to Federal, State, and local agencies. These reports have been summarized by the National Resources Board in its published report *State Planning—A Review of Activities and Progress*, June, 1935, which also contains a bibliography of the reports.

During 1935 the State Planning Boards have continued to receive assistance from the National Resources Board (name changed to National Resources Committee by Executive Order of the President, June 30, 1935) through assignment of consultants, exchange of information between State and Federal agencies and development of co-operative relations with Federal agencies. See CITY, NATIONAL, STATE, AND REGIONAL PLANNING; NATIONAL RESOURCES COMMITTEE.

STATISTICAL ASSOCIATION, AMERICAN An organization founded in Boston in 1839 to foster an interest in statistics and to promote sci-

ing, "Statistical Teaching," "Statistical Technique," "Price Changes," "Statistical Controls in Business," and "Demographic Statistics."

The officers elected for 1936 were: President, Joseph S. Davis, Food Research Institute, Stanford University, California; vice-presidents, Morris A. Copeland, A. R. Crathorne, George E. Barnett, Herbert A. Toops, Henry Schultz, F. Leslie Hayford, Donald M. Marvin, Paul T. Cherington; secretary-treasurer, Frederick F. Stephan, 722 Woodward Bldg., Fifteenth and H Streets, Washington, D. C.

STATISTICS. Cost of Goods. A revised index of the cost of goods purchased by wage earners and lower-salaried workers was announced in September by the Cost of Living Division of the Bureau of Labor Statistics. In summary, the significance of this revision is given as follows: "The index of food costs is very much higher at the peak than the index previously constructed. . . . For the most part, however, the revised index of food costs parallels the course of the old index. . . . The effect of the new method of constructing the all items index is to decrease the influence of food in the index and to increase the influence of other items, particularly of rent." Table I shows the index numbers at various periods from 1913 to date. It should be noted that the lowest point on the all items index was reached in June, 1933 (129.8) as far as the current depression is concerned, and that there has been a steady rise since that time.

TABLE I—INDEXES OF THE COST OF GOODS PURCHASED BY WAGE EARNERS AND LOWER-SALARIED WORKERS IN THE LARGER CITIES OF THE UNITED STATES, COMBINED

Date	Food	Clothing	Index numbers (1913 = 100)				Miscellaneous	All items
			Rent	Fuel and light	House furniture			
Average, 1913	100 0	100 0	100 0	100 0	100 0	100 0	100 0

entific methods of collecting and interpreting statistical data. The official publication is the *Journal of the American Statistical Association*.

The association's ninety-seventh annual meeting was held in New York City, Dec. 27-31, 1935. Several joint meetings were held with the American Association for Labor Legislation, American Farm Economic Association, American Sociological Society, Econometric Society, and the Population Association of America which were meeting in New York at the same time. Among the topics discussed were: "Recent Developments in the Collection of Industrial Statistics," "The Statistics of Marketing," "The Nature of the Business Cycle," "The Recovery Programme and Agriculture," "The Logic of Statistics," "Unemployment Insurance," "Old Age Pensions," "Public Health Problems," "Current Developments in Commercial Bank-

Family Income. In connection with the revision discussed above, a study of money disbursements of wage earners and lower-salaried workers was carried out. The first report of this study was concerned with the situation in Manchester, New Hampshire. Summary Table II clearly shows that a budgetary deficiency exists for all families studied having incomes below \$1500 a year and that the "excess" does not become important until the "\$2500 and over" level is reached. The figures presented also show that the size of the families studied appreciably influenced the nature of the expenditures (see Table III). The largest items in all budgets covered the cost of food.

Hourly Wages. The average earnings per hour for labor were higher in 1934 than for any year since 1931, and 12 per cent higher than in 1933, according to a report by the Bureau of Labor Statis-

TABLE II—FAMILY COMPOSITION, INCOME AND DISBURSEMENTS, YEAR ENDING AUG. 31, 1934, FOR FAMILIES OF WAGE EARNERS AND LOW-SALARIED WORKERS IN MANCHESTER, N. H.

[Preliminary figures]

Annual income group	Number of families	Average number of persons per family	Average number of earners per family ^a	Average family income	Average total current expenditures	Difference between income and current expenditures
Under \$900	10	2.6	1.3	\$ 751	\$ 844	—\$ 93
\$900 and under \$1,200	25	3.6	1.7	1,058	1,132	— 74
\$1,200 and under \$1,500	41	4.1	2.0	1,349	1,396	— 47
\$1,500 and under \$1,800	29	4.2	2.0	1,618	1,585	+ 33
\$1,800 and under \$2,100	20	4.0	2.5	1,953	1,831	+ 122
\$2,100 and under \$2,500	16	5.1	3.1	2,258	2,202	+ 56
\$2,500 and over	9	7.3	4.3	3,234	3,027	+ 207
All incomes	150	4.3	2.2	1,603	1,593	+ 10

^a Includes all persons having worked at any time during the year.

TABLE III—AVERAGE EXPENDITURES OF 150 FAMILIES OF WAGE EARNERS AND LOWER-SALARIED WORKERS, YEAR ENDING AUG. 31, 1934, IN MANCHESTER, N. H.

[Preliminary figures]

	Income group		
	Under \$1,500	Over \$1,500	All incomes
Number of families	76	74	150
Average number of persons per family	3.7	4.9	4.3
Total current expenditures	\$1,236	\$1,960	\$1,593
Distribution of current expenditures:	Per cent	Per cent	Per cent
Food	37.4	36.4	36.8
Clothing	10.5	14.2	12.7
Housing	14.3	10.6	12.1

Gifts	8	1.2	1.0
Other family expenditure	6	.4	.5
Total	100.0	100.0	100.0

tics. This study states that the general trend of average hourly earnings was upward from 1840 to 1929, the most rapid rises coming during the Civil and World Wars and temporary declines taking

place in periods of depression. The total effect was to produce such contrasts as that between 1920 and 1914, the index in the former year being 120 per cent higher than in the latter. In 1929 the index was at 233. There then followed what the report characterizes as "the most appalling and destructive depression that has occurred in this country." By 1933 the index number was 26.3 per cent below the 1929 level. Since then, the rise recorded above has taken place. Table IV gives the index numbers from 1840 through 1934.

TABLE IV—INDEX NUMBERS OF AVERAGE EARNINGS PER HOUR (EXCLUSIVE OF AGRICULTURE), 1840 TO 1934

[Based on currency or legal tender of United States. Average per hour in 1913 = 100]

Year	Index number	Year	Index number
1840	33	1920	234
1845	33	1921	218
1850	35	1922	208
1855	38	1923	217

Wages (selected industries) ^a	100.0	82.9	61.7	40.8	41.8	52.0
Salaries and wages (all other industries)	100.0	95.5	84.8	70.1	63.5	68.4
Other labor income	100.0	105.8	115.6	117.3	104.0	96.2
Property income ^c	100.0	100.7	86.6	70.4	60.1	61.4
Dividends	100.0	97.2	72.3	46.1	34.2	38.7
Interest	100.0	104.0	102.4	98.9	89.5	88.3
Net rents and royalties	100.0	80.5	53.8	33.6	27.7	31.6
Entrepreneurial withdrawals	100.0	93.7	81.0	64.2	59.3	65.2

^a Includes mining, manufacturing, construction, steam railroads, Pullman, railway express, water transportation.^b Includes pay rolls and maintenance of Civilian Conservation Corps enrollees and pay rolls of Civil Works Administration and Federal Emergency Relief Administration work projects plus administrative pay rolls outside of Washington. ^c Includes net balance of international flow of property incomes.

National Income. The Division of Economic Research, Bureau of Foreign and Domestic Commerce reported in August that the national income increased by five billion dollars, or 11 per cent, between 1933 and 1934. All types of income rose except "other labor income" and interest payments, but the highest proportionate gains came in those types of income payment that had declined most as a result of the depression. An interesting innovation in this report was the effort to include relief payments in the national income figures. This procedure does not meet with the approval of all economists who consider relief allowances, not income but drafts on capital accumulations. See Table V.

Wholesale Prices. An index of wholesale prices extending over 134 years, 1801 to 1934 inclusive, was announced by the Bureau of Labor Statistics in July. The index was based on the earlier work along these lines done by Prof. Alvin H. Hansen. This index reflects the influence of the major wars in which the United States has participated and the depressions through which the country has passed. The low point was reached in 1896 (46.5), but since the opening of the 20th century, the trend has generally been upward, but it is interesting to note that the last time the index reached 100 was in 1926 and that in 1929 it stood at 95.3. See Table VI.

TABLE VI—INDEX NUMBERS OF WHOLESALE PRICES, 1801 TO 1934
[1926 = 100.0]

Year	Index number	Year	Index number	Year	Index number	Year	Index number
1801	111.8	1835	74.6	1869	93.5	1903	59.6
1802	91.8	1836	83.5	1870	86.7	1904	59.7

STAVISKY SCANDAL. See FRANCE under History.

STEAM TURBINES. Steam turbine practice during the past year reflected a demand for back-pressure turbines operating at high initial pressures and higher temperatures and exhausting to existing equipment in the stations. This was in line with the general trend, in both industrial plants and central stations, toward the use of higher pressures and temperatures and the super-

imposing of new capacity on old capacity instead of building new plants. Also an increasing number of extraction turbines were installed in industrial power plants. In many of these closer automatic regulation of the steam extracted for process was a requirement. New forms of hydraulic governor control were also brought out.

The growing importance of 3600 r.p.m. machines is noted, one back pressure turbine of 40,000 kw (kilowatts) capacity having been sold to run at this speed. This is twice the capacity of any previous machine designed for this rotative speed. One company announces that it is prepared to build turbines up to 50,000 kw at 3600 r.p.m. and up to 200,000 kw for 1200 lb. pressure, 1000° F steam temperature and 1800 r.p.m. Condensing turbines for 1800 r.p.m. are offered up to 100,000 kw in the single exhaust design and 200,000 kw in the double-flow design. Single-casing, 3600 r.p.m. condensing turbines up to 15,000 kw for 400 lb. steam pressure and up to 2500 kw for 1200 lb. pressure, 900° F temperature are also offered.

As to advances in structural details the low-pressure casings of some units were being welded, and welding was also employed for the valve chest and for parts where single castings would be complicated and difficult to make. Moisture from condensation of the steam in the low-pressure stages, where high peripheral speeds obtain, has long been a cause of blade erosion. Provision of suitable drains in the casing has helped to lessen this difficulty but the employment of stellite shields on the low-pressure blading appears to be the most effective means devised to date. As a rule, blade materials that have the necessary resistance to erosion do not have the required strength and other desirable properties. Employment of higher steam temperatures has obviated the necessity of reheating the steam between the high-pressure and the low-pressure elements. Different blade materials are being used by different builders for various steam and service conditions; for instance, chromium alloys and molybdenum alloys are often employed where high temperatures and high stresses are encountered.

Among some of the more important turbines recently placed in service or being built may be mentioned a 110,000 kw, 1200 lb., 925° F vertical condensing unit for the Rouge plant of the Ford Motor Company. This was the largest high-pressure machine to date. It will exhaust to a condenser of 73,000 sq. ft., having a feedwater heater placed directly in the shell above the tubes.

In August, 1935, a 165,000 kw tandem-compound turbine was placed in service at the Richmond Station of the Philadelphia Electric Company. This is an 1800 r.p.m. machine taking steam at 375 lb. pressure, and 825° F of temperature. It exhausts to the largest single shell condenser yet built, which contains 113,000 sq. ft. of heating surface and 17,700 tubes.

Another large turbine that went into operation during the year was the 80,000 kw, 1230 lb. pressure unit at the Port Washington Station of the Milwaukee Electric Railway, Power & Light Company. It is supplied by a single boiler of 690,000 lb. of steam per hour capacity.

Toward the end of the year a 40,000 kw, 3600 r.p.m., turbine-generator was ordered for the Logan Station of the Appalachian Power Company. This will operate at 1250 lb. pressure, 925° F steam temperature and exhaust at 215 lb. back-pressure to the existing station mains. The generator of the unit will be hydrogen cooled.

There was also ordered for the Waterside Station of the New York Edison Company a 50,000 kw, 60 cycle, turbine-generator to operate at 1400 lb. pressure, 900° F temperature and exhaust to the present station equipment at approximately 200 lb. pressure.

Two other large units of 60,000 kw each were being built for the Conners Creek Station of the Detroit Edison Company to operate at 600 lb. pressure, and 825° F temperature.

In the industrial field a considerable number of turbines of medium capacity were installed to operate at pressures ranging from 400 to 900 lb. and with steam temperatures up to 850° F. The greater part of these were for back-pressure or extraction operation.

STEVENS INSTITUTE OF TECHNOLOGY. A college of engineering at Hoboken, N. J., founded in 1870. The enrollment for the autumn of 1935 was 452 undergraduate and 18 graduate students. There were 60 members on the teaching staff. The income for 1934-35 was \$370,000. President, Harvey Nathaniel Davis, Ph.D.

STRAITS SETTLEMENTS. A British crown colony comprising the four settlements of Singapore (including Christmas and Cocos-Keeling Islands), Penang (including Province Wellesley), Malacca, and Labuan. Total area, 1352 sq. miles; total population (June 30, 1934), 1,038,903 exclusive of the Dindings (183 sq. m.; 18,205 people) retroceded to Perak, Federated Malay States, on Feb. 16, 1935. Chief towns: Singapore (capital), 433,432 inhabitants in 1931; George Town (Penang); Malacca; Victoria.

Production and Trade. In 1934 the main products were rubber (59,683 tons), coconuts, coffee, rice (42,034 tons), pineapples, fish, tin (67.78 tons), and phosphate of lime, from Christmas Island (129,191 tons). The tin smelters produced (principally from imported ore) 49,637 tons of tin during 1934. In 1934, imports were valued at \$428,000,000; exports, \$459,000,000 (S\$ averaged \$0.5901 for 1934). The merchant vessels that entered and cleared the ports during 1934 aggregated 44,006,480 tons.

Government. For 1934, revenue amounted to \$34,244,603; expenditure, \$30,937,262. The public debt on Dec. 31, 1934, was \$59,257,302 against which the sinking fund was valued at \$20,161,364. Government was vested in a governor assisted by an executive council of 11 members, and a legislative council of 26 members. Governor in 1935, Sir Shenton Thomas.

History. The extension of the passenger air service from Singapore to Australia on the London to Australia route was in operation during 1935. It was announced in December that George Town (Penang), Straits Settlements, was to be a scheduled stop for Imperial Airways in place of Alor Star in Kedah, Unfederated Malay States.

STRATOSPHERE FLIGHT. See AERONAUTICS; GEOGRAPHIC SOCIETY, NATIONAL; PHOTOGRAPHY.

STRIKES AND LOCKOUTS. As the year 1935 draws to a close it is apparent that the wave of labor unrest which began in 1933 is continuing unabated. While the year was marked by no strikes comparable in extent and intensity to the San Francisco general strike and the textile strike of 1934, several smaller disturbances of great significance took place, notably the strike at the N. Y. Shipbuilding Corporation, Camden, N. J., the Terre Haute General Strike in July, that in the National Biscuit Company plants in the East, the Ohrbach strike in New York City, the Newark Ledger strike, and the lumber workers' strike in Washington, Oregon, and California. These will be the subjects of special discussion below.

Table I shows that the number of man-days idle in September, 1935, was greater than in any month during 1934 with the exception of September, when the textile strike was in progress. The industries most subject to disturbances in 1935 were textiles, transportation and communications, building and construction, food, wholesale and retail trade, coal, and lumber. The year was also marked by a large number of strikes on work relief projects, these usually being supported in some measure by the regularly employed workers organized in trade unions. From April and continuing through Sep-

TABLE I—STRIKES AND LOCKOUTS, JANUARY, 1934 TO DECEMBER, 1935

Month	Number of strikes and lockouts					Workers involved in strikes and lockouts		
	Beginning—		In progress during month	Ended in month	In effect at end of month	Beginning in month	In progress during month	Man-days idle during month
	Prior to month	In month						
1934

* Preliminary figures.

tember, there were never less than 100,000 men on strike, and in the latter month the figure shot up to 518,000 when the bituminous coal miners went out for one week.

Some reasonable idea of the nature of the industrial unrest of 1935 can be gained by making an analysis of the situation by months from January through June in the industries particularly affected, specified above, and where such an analysis is impossible, in general:

January: 29 strikes in *textiles* began in January, involving 25,408 workers, and 46 all told were then in progress, involving 29,068 workers. The same figures for *transportation and communication* were 14 involving 22,827 and 19 involving 23,696; for *building*, 6 involving 1854 and 11 involving 2255; for *food*, 7 involving 5927 and 14 involving 6631; in *wholesale and retail trade*, 11 involving 969 and 17 involving 2019; in *coal*, 4 involving 5830 and 6 involving 6247; in *lumber*, 4 involving 153 and 6 involving 186; and in *relief*, 6 involving 7266 and 8 involving 7831. More than 5000 workers were involved in each of the following States: New Jersey, New York, Pennsylvania. Of the strikes beginning in January, 41.6 per cent were wage disputes, 13.6 involved discrimination, the rest being attributed to a miscellany of causes. Of the 111 ended during the month 45 lasted less than a week and but three for three months or more. The settlements were brought about by government conciliators or labor boards in over half of the instances. Half of them were settled in a manner favorable to labor, one-fourth unfavorably to labor, the rest being difficult to interpret.

February: 31 strikes in *textiles* began in February, involving 16,620 workers, and 44 all told were in progress involving 19,733 workers; in *transportation and communication*, 10 involving 1030 and 13 involving 1145; in *building*, 6 involving 359 and 9 involving 391; in *food*, 6 involving 2282 and 15 involving 8168; in *wholesale and retail trade*, 11 involving 4790 and 14 involving 5030; in *coal*, 8 involving 15,202 and 10 involving 19,372; in *lumber*, 12 involving 657 and 16 involving 782; and in *relief*, 7 involving 3101 and 10 involving 10,181. More than 5000 workers were involved in each of the following States: Illinois, New Jersey, New York, Ohio, Pennsylvania. Of the strikes beginning in February, 29.1 per cent were wage disputes, 17.5 involved discrimination, and 10 per cent the closed shop. Of the 114 ended in the month, 48 lasted less than one week, and but two three months or more. Settlements were negotiated by government labor boards or conciliators in just short of half of the instances, half of the settlements were favorable to labor, and one-third unfavorable.

March: 40 strikes in *textiles* began in March, involving 8469 workers, and 65 all told were then in progress involving 25,475 workers; in *transportation and communication*, 16 involving 4936 and 18 involving 5176; in *building*, 8 involving 1263 and 13 involving 1653; in *food*, 5 involving 3381 and 15 involving 8861; in *wholesale and retail trade*, 7 involving 966 and 14 involving 5377; in *coal*, 5 involving 6873 and 7 involving 12,973; in *lumber*, 7 involving 1449 and 16 involving 11,345; and in *relief*, 6 involving 1902 and 12 involving 5093. More than 5000 workers were involved in each of the following States: California, Illinois, New York, Ohio, Pennsylvania. Of the March strikes, 30 per cent originated in wage disputes, 14 per cent concerned discrimination, and 13 per cent were for recognition. Of the strikes ended, 48 had lasted less than a week and but 4 for three months or more. Government conciliators and labor boards settled 38 per cent of them, and employer-union negotiations, 35 per cent. Over half of the settlements were favorable to labor, and a little more than a quarter unfavorable.

April: 23 strikes in *textiles* began in April involving 23,777 workers, and 53 were in progress all told involving 41,692, in *transportation and communication*, 7 involving 2192 and 16 involving 4612; in *building*, 16 involving 786 and 21 involving 1842; in *food*, 10 involving 1747 and 19 involving 7146; in *wholesale and retail trade*, 12 involving 1408 and 18 involving 2617; in *coal*, 5 involving 1849 and 8 involving 14,229; in *lumber*, 16 involving 4063 and 22 involving 4597, and in *relief*, 12 involving 1358 and 17 involving 3661. More than 5000 workers were involved in each of the following States in strikes beginning in April: New York, Ohio, Pennsylvania. Of the April strikes, 40 per cent concerned wages. Of those ending during the month, 50 lasted less than a week and but 3 for three months or longer. Government conciliators or labor boards negotiated 36 per cent of the settlements and 35 per cent were arranged by employer-union negotiations. A little less than half ended favorably to labor and about a quarter unfavorably.

May: 14 new strikes occurred in *textiles* during May involving 5569 workers, making 39 in progress all told involving 12,297 workers; in *transportation and communication*, 19 involving 3297 and 28 involving 6792; in *building*, 15 involving 1794 and 25 involving 2229; in *food*, 11 involving 3593 and 20 involving 5130; in *wholesale and retail*

trade, 6 involving 388 and 15 involving 2664; in *coal*, 6 involving 12,654 and 7 involving 18,964; in *lumber*, 13 involving 42,427 and 25 involving 44,892; and in *relief*, 3 involving 692 and 6 involving 2487. More than 5000 workers were involved in each of the following States: Illinois, New Jersey, Ohio, Pennsylvania. Of the May strikes, 42 per cent involved wages. Of the strikes ended, 59 had lasted less than a week and 8 had lasted three months or more. Government conciliators and labor boards settled 35 per cent of them, and employer-union negotiators 36 per cent. A little less than half ended favorably to labor and about a quarter unfavorably.

June: 57 new strikes in *textiles* began in June involving 16,385 workers and 82 all told were in progress involving 24,829 workers, in *transportation and communication*, 6 involving 4154 and 18 involving 6907; in *building*, 9 involving 1120 and 16 involving 1847; in *food*, 12 involving 3032 and 19 involving 3689; in *wholesale and retail trade*, 8 involving 905 and 17 involving 1896; in *coal*, 6 involving 4776 and 10 involving 14,045; in *lumber*, 7 involving 1744 and 18 involving 38,722; and in *relief*, 3 involving 91 and 5 involving 1831.

Of the June strikes, 46 per cent involved wages. Of the strikes ended 51 had lasted less than a week and 11 three months or more. Government conciliators and labor boards arranged 31 per cent of the settlements, and 33 per cent were brought about by employer-union negotiations. Over two-fifths were settled favorably to the workers, and 36 per cent ended unfavorably.

From these summaries several generalizations can be drawn: (a) that in industries known to be in a disturbed state, like textiles, the persistence of small strikes is very notable; (b) that the States with large numbers of workers out on strike fairly constantly are the highly industrialized States; (c) that wage disputes are by far the most important causative factor; (d) that most strikes are of short duration; (e) that most of the settlements are brought about outside governmental channels; (f) and that labor has about a 50-50 chance of winning its demands in any given instance.

Camden Shipyard Strike. Several strikes which took place during the nine-month interval under review demand special comment. Over 4000 workers in the Camden yards of the N. Y. Shipbuilding Corporation, organized in the Industrial Union of Marine and Shipbuilding Workers (not A.F. of L.), were out on strike for a period of 15½ weeks ending Aug. 29, 1935. There were 15 specific issues involved, including a wage increase and the closed shop. The strike was a sharp struggle on both sides, for long completely baffling to the Federal conciliators and labor boards, and complicated by the fact that the company held a large naval contract, thus bringing the Navy Department into the picture. The picketing was noticeably intense and highly successful. After repeated failure had marked all efforts on the part of existing organizations to effect an agreement, the President appointed the Camden Arbitration Board to which both sides agreed to submit their cases and abide by the decision. As announced on October 12, the decision provided, among other things, for the 8-hour day, 36-hour week, 1½ rate for overtime and double time for holidays; a 5 per cent increase in piece work and basic hourly rates; and a prohibition of strikes and lockouts during the life of the agreement which is defined as equivalent to the length of time it will take to complete the Navy Department contracts.

National Biscuit Co. Strike. The National Biscuit Company strike began in January, 1935, and continued until May 2nd to the accompaniment of picketing not only of the factories involved but also stores selling products of the company. The sympathetic cooperation with the strikers of various "consumer" groups was notable. Originating in a wage dispute in the Philadelphia plant, the strike spread, on a sympathetic basis, to the factories in New York City, Newark, N. J., York, Pa., and Atlanta, Ga., eventually involving over

6000 workers. The settlement was brought about by the intervention of Federal and State mediators and included a provision against discrimination in rehiring, one for an adjustment of wage rates, and one concerning the specific improvement of working conditions. It was also agreed that no strike would be called in the future without a 72-hour notice preceded by a secret ballot of union members.

Newark Ledger Strike. On Mar. 28, 1935, an agreement between the Newark Newspaper Guild and the trustees of the Newark Morning *Ledger* brought to an end a strike, begun on Nov. 17, 1934, which had involved 43 newspaper men. It too was punctuated by picketing, mass demonstrations, and nation-wide publicity. Moreover it was the first strike attempted by the Guild and involved what were unquestionably white collar workers. Precipitated by the discharge of the workers for membership in the Guild, the settlement provided for the return of all discriminated against and the negotiation of a wage and hour agreement with the organization.

Ohrbach Stores Strike. The strike in the Ohrbach's Affiliated Stores followed somewhat the precedent established by the so-called Boston Store strike in Milwaukee, described as "America's first major retail department-store strike." The latter lasted from Nov. 30, 1934, until Jan. 11, 1935, and while the settlement effected did not please all the workers, the unions involved accepted it and ended the boycott against the management. The settlement included wage adjustments and a guarantee against discrimination in rehiring the striking workers. The Ohrbach strike began on Dec. 15, 1934, and ended Mar. 8, 1935. It was called by the Office Workers' Union because of the refusal of the management to negotiate, the allegation being that the Union represented but a minority of the employees. The strike was punctuated by vigorous picketing and mass arrests of the pickets, as well as the intervention of a group of artists and writers on the side of the strikers. The settlement, arranged by the Regional Labor Relations Board, amounted to a return to *status quo ante bellum*.

Northwest Lumber Strike. A strike which can only be understood in relation to the depletion of a natural resource is the great lumber strike in the northwest. Half of the manufacturing wage earners in Washington and Oregon are engaged in the lumbering industry and they constitute one-fourth of all such workers in the United States. They are divisible into two groups of about equal size, the loggers and the mill workers. As the timber becomes exhausted in one area, the workers are moved to another, thus making for the development of casual labor and the chaotic social conditions it implies. In addition there are marked seasonal fluctuations in employment due to weather conditions both as they effect the industry itself and the demand for its products. Finally, there has been considerable technological displacement since the World War. When strike agitation began in March, 1935, average wages in the industry were but \$18.88 per week for males, as contrasted with \$21.09 for all workers in manufacturing industries, and the accident rate was $3\frac{1}{2}$ times as frequent. The strike officially began on May 6 and reached its peak early in June and while many plants made agreements with the two principal unions during the period of the strike and reopened their works, the struggle did not end until the middle of August. By and large it was inconclusive, the full wage demand not having been met, but the unions claim-

ing that they are now dominant in the industry for the first time since the World War.

Terre Haute General Strike. The Terre Haute general strike was a national issue and though it lasted but two days—July 22 and 23, 1935—the ultimate consequences had not appeared at the end of the year. It was the third general strike in American history, those preceding being at Seattle in 1919 and San Francisco in 1934. It grew out of a strike in the plant of the Columbian Enameling & Stamping Company which had been in progress since Mar. 23, 1935. Although government conciliators and the A.F. of L. national officials succeeded in calling off the general strike, the Columbian strike continued, as also did martial law.

SUEZ CANAL. Traffic in the Suez Canal for 1934, as reported at the annual meeting of the directors of the Compagnie Universelle du Canal Maritime de Suez in June, 1935, showed an increase in net tonnage of 3.5 per cent over 1933, and slightly surpassed that of 1930. The total for the year amounted to 31,750,802 net tons, against the final net tonnage of 1933 of 30,676,672; with 28,340,290 net tons for 1932, 30,027,911 for 1931, and 31,668,759 for 1930. French, Japanese, Portuguese, and Russian traffic showed heavy declines; otherwise the leading mercantile nations showed a substantial increase in tonnage. The accompanying table gives the total transits and net tonnage of the leading nations for the year.

SUEZ CANAL COMMERCIAL TRAFFIC

Flag	No. of transits	Net tonnage	
		1934	1933
American	84	524,089	485,513
British	3,071	17,238,128	16,018,235

Yugoslav ..	6	16,922	2,913
Total ..	5,663	31,750,802	30,676,672

The net tonnage of vessels passing through the canal with cargo only during 1935 was 21,048,000 (20,940,000 in 1934). The canal during 1935 was used for the transportation to Eritrea and Italian Somaliland of the armies and supplies with which Premier Mussolini undertook the conquest of Ethiopia (q.v.), commencing Oct. 3. With the development of the Anglo-Italian crisis over Ethiopia and the application of economic sanctions against Italy by the member states of the League of Nations, there was much discussion of the advisability of closing the canal to Italian vessels, but no such action was taken up to the end of 1935. See GREAT BRITAIN, ITALY, and EGYPT under *History*.

SUGAR. Preliminary data published by the U.S. Department of Agriculture placed the world's raw sugar production in 1934-35 at 27,958,000 short tons of which nearly 37 per cent was beet sugar. The cane sugar production was reported distributed approximately as follows: North and Central America and the West Indies 5,640,000 tons, Europe and Asia 8,265,000 tons, South America 1,800,000 tons, Africa 901,000 tons, and Oceania 853,000 tons. The yields, also in short tons, of the leading cane sugar producing countries were estimated as follows: India 5,695,000 tons, Cuba 2,592,800 tons, Taiwan 1,101,200 tons, Hawaii 952,000 tons, Philippines 824,000 tons, Puerto Rico 784,000 tons, Brazil 771,000 tons, and Java 504,000 tons. The 26 countries reporting to the International Institute of Agriculture placed their total production of raw beet sugar for the season 1935-36 at approximately 10,636,000 tons. The yields of the leading countries were given as follows: Soviet Republics 1,984,000 tons, Germany 1,768,500 tons, France 1,065,000 tons, Great Britain 700,000 tons, and Czechoslovakia 614,400 tons.

The 1935 sugar beet production of the United States as estimated (preliminary) by the Department of Agriculture was 7,984,000 short tons, about 500,000 tons more than the crop of 1934 and approximately 3,000,000 tons less than the record crop of 1933. The yield per acre 10.4 tons, was about average and the sugar content of the sliced beets, 16.48 per cent, was reported as about 10 per cent better than average. The production of beet sugar was estimated at 1,170,000 tons compared with 1,154,000 tons in 1934 and 1,642,000 tons in 1933. The average farm price per ton of beets was about \$5.15 in 1935 and 1934. The sugar beet production of the leading States was reported as follows: Colorado 1,811,000 tons, California 1,453,000 tons, and Michigan 712,000 tons. The production of these States of beet sugar, mostly refined, was estimated at 290,000 tons, 238,000 tons, and 100,000 tons respectively.

The 1935 cane sugar production of Louisiana was estimated at 291,000 short tons from 3,756,000 short tons of cane. This State produced in addition 6,598,000 gal. of cane sirup and 21,034,000 gal. of molasses. Eight southern States including Louisiana reported a total sugar cane sirup production of 24,699,000 gal. from 145,000 acres of cane. Sixteen States, with Alabama leading, produced 12,438,000 gal. of sorgo sirup and 10 States, with Vermont and New York leading, produced 1,704,000 lb. of maple sugar and 3,377,000 gal. of maple sirup.

During the fiscal year ended June 30, 1935, the United States exported 152,000 short tons of sugar, 409,000 gal. of cane and maple sirup, and 4,764,000 gal. of molasses and imported 2,375,000 tons of sugar.

SUMATRA. See NETHERLAND INDIA.

SUNDAY, WILLIAM ASHLEY ("BILLY"). An American evangelist, died in Chicago, Nov. 6, 1935. Born in Ames, Ia., Nov. 19, 1863, he attended Northwestern University for a short time and in 1883 became a professional baseball player playing with the Pittsburgh and Philadelphia teams of the National League. Attending a revival meeting in Chicago in 1886, he was converted, and gave up his baseball career in 1890 to become an assistant secretary in a YMCA in Chicago in 1891.

In 1896, Mr. Sunday became an evangelist, and from that time conducted evangelistic services in the principal cities of the United States. The Chicago Presbytery ordained him to the Presbyterian ministry in 1903, and during the period 1904 to 1907 he made an average of from 1000 to 5000 con-

verts a month. The revival meeting held at Philadelphia in 1915 was considered his most successful. Two years later, however, a ten-week meeting was held in New York City, where 98,000 persons professed conversion. At the General Assembly of the Presbyterian Church in the United States held in Columbus, O., in May, 1918, he served as a delegate of the Chicago Presbytery. In 1912, Westminster College conferred upon him the degree of Doctor of Divinity.

His forceful preaching, often full of invective and denunciation, brought him to the public eye, and his meetings, characterized by good music and the "sawdust trail," the aisle down which the converts went to the altar, attracted thousands of people of every walk of life. An ardent prohibitionist his sermons were frequently delivered against the devil and the demon rum.

In 1933, Dr. Sunday suffered a heart attack while conducting a revival at Des Moines, Ia., and for several months he left the evangelist field. In 1934 he returned to conduct a two weeks' revival meeting in New York. Poor health again caused him to retire except for an occasional sermon delivered in the vicinity of his home.

SUNDAY-SCHOOL UNION, AMERICAN. A nonsectarian society, organized in Philadelphia in 1817 to establish and maintain Sunday schools in the rural and mountain sections of the United States and to publish and circulate Christian literature. Its board of managers and missionary force are composed of men representing many of the Protestant denominations. For the year ending Feb. 28, 1935, the society maintained 3705 union Sunday schools, with 148,883 scholars, and conducted 901 daily vacation Bible schools, with 25,526 in attendance. During the same period it established 177 young people's societies, opened 79 preaching stations, organized 20 churches which were turned over to the various denominations chosen by their constituencies, and erected six church buildings. The officers were: President, E. Clarence Miller, LL.D.; vice-presidents, Robert L. Latimer and James F. Shrader; national secretary of missions, Elliott D. Parkhill, D.D.; editor of publications, Arthur M. Baker, Ph.D.; and treasurer, John H. Talley. National office is at 1816 Chestnut Street, Philadelphia, Pa.

SUPREME COURT. See UNITED STATES.

SURGEONS, AMERICAN COLLEGE OF. A college or guild (not a teaching institution), organized in 1913 by some 500 surgeons of North America to elevate the standard of surgery. Fellowships in the organization are granted on the basis of merit only, with reference to professional ability and moral and ethical fitness. In 1935 these numbered approximately 12,000.

The college's twenty-fifth annual congress was held in San Francisco, Calif., Oct. 28-Nov. 1, 1935, with an attendance of more than 2000 surgeons. The organization's official journal is *Surgery, Gynecology, and Obstetrics*.

The officers elected for 1935-36 were: President, Dr. Donald C. Balfour, Rochester, Minn.; president-elect, Dr. Eugene H. Pool, New York; vice-presidents, Drs. Arthur W. Allen, Boston, and John A. Gunn, Winnipeg; and treasurer, Dr. Frederick A. Besley, Waukegan, Ill. Since the death of Dr. Franklin H. Martin (q.v.), the directorship is invested in an Executive Committee, consisting of Drs. George Crile, Chairman, Irvin Abell, Frederick A. Besley, Robert B. Greenough, Allen B. Kanavel, George P. Muller, J. Bentley Squier, and Donald C. Balfour. Dr. Malcolm T. MacEachern and Dr. Bowman C. Crowell are associate direc-

tors. Headquarters are at 40 East Erie Street, Chicago, Ill.

SURGERY. See **MEDICINE AND SURGERY.**

SURINAM, *sōō'ri-nam'* (**DUTCH GUIANA**). A colony of the Netherlands in South America. Area, 54,291 sq. miles; population (1931), 155,888 exclusive of Negroes and Indians living in the forests. Paramaribo, the capital, had 50,294 inhabitants. Sugar, cacao, coffee, rice, rum, bananas, balata, and bauxite were the main export products. In 1933, imports were valued at 4,899,186 guilders; exports, 3,801,671 guilders (guilder averaged \$0.5146 for 1933). The budget for 1935 was balanced at 6,744,000 guilders (including a government subvention of 2,688,000 guilders). The colony was administered by a governor assisted by an advisory council. Governor, Dr. J. C. Kielstra.

SVALBARD, *sval'bar*. An archipelago owned by Norway, comprising West Spitsbergen, North East Land, Prince Charles Forland, Edge Island, Bear Island, and adjacent islands. Total area, 24,294 sq. miles; population (wintering force in 1933-34), 1942. Capital, Longyearbyen. Coal mining was the main industry. In 1934 the estimated output of coal was 477,000 metric tons. The budget for 1934-35 was balanced at 121,500 kroner (krone averaged \$0.2532 for 1934).

SWARTHMORE COLLEGE. A nonsectarian coeducational institution for higher education in Swarthmore, Pa., founded in 1864 by the Society of Friends. The 1935-36 enrollment was 640. The teaching staff numbered 96. The total endowment was \$7,000,000, and the income for the year was \$693,000. In 1935 a new Athletic Field House was built and a new Senior Dormitory for men acquired. The library contained 90,000 volumes. President, Frank Aydelotte, LL.D.

SWAZILAND, *swā'zê-lând*. A British protectorate in South Africa. Area, 6705 sq. miles; estimated population (1933), 125,775 including 122,290 natives and 2775 Europeans. Capital, Mbabane. Maize, tobacco, tin, groundnuts, cotton, and millet were the main products. Cattle raising was an important occupation. Livestock in the protectorate (1933): 309,814 cattle, 134,000 native sheep and goats, 2399 horses, 9816 asses, and 508 mules. Each year the Transvaal sends about 300,000 sheep into Swaziland for winter grazing. For customs purposes Swaziland was considered a part of the Union of South Africa and received a fixed percentage of the Union total each year.

Government. For the year ended Mar. 31, 1934, revenue totaled £93,499; expenditure, £113,858; public debt, £55,000. Government was administered by a resident commissioner under the British High Commissioner for South Africa. Resident Commissioner, A. G. Marwick (June, 1935). See **SOUTH AFRICA, UNION OF**, under *History*.

SWEDEN. A constitutional monarchy of Scandinavia. Capital, Stockholm. Sovereign in 1935, Gustaf V, who succeeded to the throne Dec. 8, 1907.

Area and Population. Sweden has an area of 173,344 square miles (land area, 158,393 sq. miles) and a population estimated in 1934 at 6,233,090 (6,141,571 at the 1931 census). The urban population in 1934 was 2,102,089. Living births in 1933 numbered 84,881; deaths, 69,579; marriages, 43,318; immigrants, 7276; emigrants, 2417. The 1934 population estimates for the chief cities were: Stockholm, 530,176; Göteborg, 255,386; Malmö, 132,552; Norrköping, 62,571; Helsingborg, 58,382. The population is predominately Lutheran in religion.

Education. Primary education is compulsory

and there is practically no illiteracy. In 1934 there were 840,440 children of school age (7 to 14 years) and the school attendance was: Elementary, 739,178; government high schools, 29,874; universities, 8636.

Production. Agriculture supports about half the population; the remainder are occupied mainly in fishing, lumbering, manufacturing, and commerce. The value of field crops in 1934 was 1,040,447,000 crowns, divided as follows (in 1000 crowns): Wheat, 120,436; rye, 75,172; oats, 140,849; potatoes, 91,009; hay, 306,815. Crop yields in 1934 were (in thousands of units): Wheat, 29,578 bu.; rye, 20,865 bu.; barley, 9462 bu.; oats, 81,364 bu.; potatoes, 58,422 bu.; sugar beets, 1862 metric tons, beet sugar (1934-35), 271 metric tons; hay, 4486 metric tons; forage roots, 3019 metric tons. The forests cover about 7,257,000 acres and support important pulpwood, paper, and wood-working industries. The sea fisheries in 1933 yielded 102,300 metric tons of fish, valued at 24,500,000 crowns.

Mineral and metallurgical production in 1934 was (in 1000 metric tons): Coal, 415; iron ore, 5253; pig iron, 558; steel ingots and castings, 861; zinc ore, 55; manganese ore, 6.3. The value of industrial production in 1933 was 4,073,935,000 crowns (3,973,840,000 in 1932), the chief industrial lines, in order of value of output in 1933, were foodstuffs, mines and metals, paper and printing, textiles and clothing, wood and its manufactures, chemicals.

Foreign Trade. Imports for consumption in 1934 were valued at 1,304,749,000 crowns (1,095,889,000 in 1933) and exports at 1,302,333,000 crowns (1,078,668,000 in 1933). Of the 1934 imports, Germany supplied 26.1 per cent (29.2 in 1933); United Kingdom, 19.5 per cent (18); United States, 11.7 (10.3). The United Kingdom took 25.5 per cent of the 1934 exports (26.9 in 1933); Germany, 13.8 (10.7); Denmark and Norway, 13.1 (11.8); and United States, 9.9 (12.2). The chief imports, in order of value, were coal and coke, iron and steel, chemicals and drugs, machinery, fruits and nuts, and corn. Leading exports were (in 1000 U.S. gold dollars): Wood pulp, 39,770; wood, 33,648; machinery, 21,567; iron and steel, 20,090; iron ore, 13,200.

Imports in 1935 totaled 1,467,955,000 crowns; exports, 1,290,794,000 crowns. United States figures showed general imports from Sweden in 1935 of \$41,244,437 (\$33,948,870 in 1934) and exports to Sweden of \$38,214,021 (\$33,064,028 in 1934).

Finance. Actual governmental revenues for the fiscal year ended June 30, 1935, totaled 1,217,141,586 crowns (1,054,023,000 crowns in 1933-34) and expenditures were 1,148,187,866 crowns (972,741,000 in 1933-34). The figures include both ordinary and capital receipts and expenditures. The public debt on June 30, 1935, totaled 2,487,098,937 crowns, compared with 2,348,962,466 crowns on June 30, 1934. The Swedish crown (krona; plural, kronor), with a par value of \$0.4537 in 1935, exchanged at an average of \$0.1847 in 1932, \$0.2203 in 1933, and \$0.2598 in 1934.

Communications. Sweden at the beginning of 1934 had 10,446 miles of state and private railway lines; 49,440 miles of highway; and air lines linking Stockholm with Helsinki and Malmö with Amsterdam. The railways in 1933 carried 64,688,000 passengers and 24,923,000 metric tons of freight, the gross receipts totaling 269,088,000 crowns. Electrification of the 383-mile railway line from Stockholm to Malmö was completed Oct. 1, 1935, raising the mileage of electrified government lines to 1331. The airlines in 1934 carried 18,072 passengers. The

gross tonnage of the merchant marine on June 30, 1935, was 1,550,800 (1,608,900 on June 30, 1934). The net register tonnage of vessels entering the ports with cargo from overseas in 1934 was 14,284,000 (13,203,000 in 1933).

Government. Executive power is vested in the King, who acts through a responsible ministry known as the Council of State, at the head of which is the Minister of State, or premier. Legislative power rests with the Diet (Riksdag) of two chambers. There is a Lower Chamber of 230 members elected for four years by universal suffrage. The 150 members of the Upper Chamber are elected for eight years by municipal and provincial councils (one-eighth annually). Premier in 1935, Per Albin Hansson (Social Democrat), appointed Sept. 24, 1932.

History. The year 1935 witnessed the celebration of the 500th anniversary of the establishment of parliamentary government in Sweden. It was appropriate that this anniversary should be accompanied by further steps toward social justice and economic security under a democratic régime such as had already established Sweden's position as one of the world's most progressive countries. A major accomplishment of this nature was the adoption by the Diet on June 8 of an advanced system of old-age pensions. Representing a marked improvement over the existing system, the measure was so comprehensive as to remove all the indigent aged from dependence upon poor-relief. It was estimated that when the system became fully effective in 1950, it would cost the government an extra 60,000,000 crowns annually.

Acting upon the recommendations of commissions which had made exhaustive studies of their respective problems, Premier Hansson's Social Democratic Government extended state control over the privately owned radio broadcasting system. Legislation was passed giving the government the right to appoint a majority of the members of the board of directors. Proposals for the establishment of state monopolies for the sale of drugs, coffee, and combustible liquids also were placed before the Diet, but did not receive its approval before the session ended on June 18. A powerful argument in favor of these proposals was the report for state enterprises for 1934, which showed net earnings of 111,100,000 crowns, or 4% per cent on the total capital investment in the undertakings.

Another important measure passed in April prohibited the manufacture of armaments in Sweden except by Swedish companies and established strict state control of all armament factories by means of a licensing system. It was provided that all new plants required a license to operate but that the existing plants might carry on unlicensed until Jan. 1, 1938. The arms-control measure was inspired largely by fear of involvement in the threatened European war, which appeared imminent following Chancellor Hitler's abrogation of the military clauses of the Versailles Treaty in March, 1935 (see GERMANY under *History*). It was also designed to end charges that some Swedish arms plants were owned by the Krupp armament firm in Germany. The extension in March of the term of army service from three months to six months and recommendations by a government commission on August 27 for a complete reorganization of the defense system at a cost of \$30,000,000 were evidences of the nation's concern at the warlike tendencies in Europe.

The breach in Swedish-German friendship caused

by the Hitler régime in Germany was further emphasized by developments during 1935. The small National Socialist movement in Sweden was exposed to a vigorous and continuous attack from the Swedish press and government. The law forbidding the establishment of political organizations of a military character and the wearing of political uniforms or emblems in public was invoked in connection with the arrest of 11 Nazi leaders by the Gothenburg police on February 14. A store of uniforms, weapons, and propaganda leaflets was seized. The press also published evidence tending to prove that the Reich Government was attempting to influence Swedish opinion through subsidized propaganda. Rudolph Hess, Reich Minister without Portfolio, received a cool reception when he spoke before the Swedish-German Society in Stockholm in May. A marked decline in the number of German books purchased by Swedish libraries was reported in the Swedish press. A trade treaty signed by the United States and Sweden on May 25 dealt a further blow to the German export trade to Sweden. Germany's failure to pay commercial debts due in Sweden was another source of irritation.

Dangers to the Scandinavian countries in the rearmament of Germany were discussed at one of the periodical conferences of the Foreign Ministers of Sweden, Denmark, and Norway held at Copenhagen on April 2. Early in December the Premiers of these three States journeyed to Helsinki to confer with Finnish Socialists on plans for united action in case of a war affecting Northern Europe. Military chiefs of the same States had met in the Finnish capital the preceding month. Meanwhile the close ties between Sweden and Denmark had been strengthened by the marriage on May 24 of Princess Ingrid, daughter of the Crown Prince of Sweden, to Crown Prince Frederik of Denmark.

Throughout 1935 economic and financial conditions in Sweden remained highly satisfactory. Industrial production continued at a level above the previous peak in 1929. While exports of lumber were the lowest since 1921, pulp shipments reached the highest level on record. The number of unemployed averaged 81,365 for the year, as against 84,685 in 1934. The 1935 harvest, however, was slightly under normal. There was an active demand for Swedish shipping and railroad carloadings reached the 1929 level. State finances continued in a remarkably healthy condition.

See DENMARK, FINLAND, and NORWAY under *History*.

SWEDISH LITERATURE. See SCANDINAVIAN LITERATURE.

SWIMMING. The really unexpectedly excellent showing made by United States swimmers in the dual meet with Japan at Tokyo in August was the 1935 highlight in water sports. The Americans lost, 36 to 27, to the Japanese, who had spread-eagled the field in the 1932 Olympics, but there were reasons. The two topnotch American backstrokers, Adolph Kiefer and Albert Van de Weghe, were unable to make the trip, and Taylor Drysdale was disqualified for a faulty turn after finishing first in the 200-meters backstroke, and Jimmy Gilhule, relied on for yeoman work in the 200-meter freestyle event and the 800-meter relay, was unable to swim because of an ear infection, and the springboard and platform diving events, Olympic fixtures, were omitted from the meet. Therefore the outcome of the meet was greatly pleasing to the United States swimmers, crushed so badly by the Nipponese three years before. Americans won

three of the six Olympic events on the card at Tokyo—the 100-meter freestyle by Peter Fick, the 400-meters by Jack Medica, and the 100-meters backstroke by Russell Branch.

As usual in the sport there were innumerable records broken. Fick and Medica both set new long-course marks in the meet at Tokyo. Fick set a new 100-meters short course mark of 0:56.6 later in the year and Medica created a new standard of 2:07.9 for 220 yards and Miss Lenore Kight set records of 11:35 for half mile and 24:20.4 for a mile. Mrs. Eleanor Holm Jarrett, the Kompa sisters, Elizabeth and Erna, the Yale University relay four, Jack Kasley of Michigan, and John Higgins of Providence were responsible for other additions to the record book.

The University of Michigan outclassed all opposition to win the N.C.A.A. meet, with 49 points to 15 scored by Yale, second in line. The New York Athletic Club took the men's indoor team title and the outdoor laurels went to the Detroit Athletic Club. The indoor women's honors were captured by the Miami Beach S.A. and the outdoor by the Women's Swimming Association of New York. The New York Athletic Club swept the water polo titles, winning the indoor and outdoor titles at both styles of game, soft-ball (international) and hard-ball (American).

SWITZERLAND. A federated republic of central Europe. Capital, Berne (Bern).

Area and Population. With an area of 15,940 square miles, Switzerland had a population estimated on Jan. 1, 1935, at 4,153,000 (4,066,400 at the 1930 census). Living births in 1934 numbered 67,277; deaths, 46,806; marriages, 32,492. The birth, death, and marriage rates per 1000 of population were 16.2, 11.3, and 7.8, respectively. Permanent populations of the principal cities in 1930 were: Zurich, 249,820 (312,600 in 1933); Basel, 148,063; Geneva, 124,121; Berne, 111,783; Lausanne, 75,915; St. Gallen, 63,947. The German-speaking population in 1930 was 2,924,314; French-speaking, 831,100; Italian, 241,985; and Romansch, 44,204. The same census showed 2,330,336 Protestants, 1,666,317 Roman Catholics, and 17,973 Jews. School enrollment in 1933-34 included 479,622 primary pupils, 48,458 secondary pupils, and 26,723 students in middle schools. Enrollment in the seven universities in the summer session of 1934 was 8503.

Production. About 45 per cent of the working population is engaged in industry, 21 per cent in agriculture, and 15 per cent in commerce. The 1934 crops (in metric tons) were: Wheat, including spelt, 181,700; rye, 31,500; oats, 20,400; potatoes, 780,400; sugar beets, 70,000. The wine production was 780,000 hectoliters. The total 1934 value of agricultural production was 1,227,850,000 francs. Milk accounted for 35 per cent of the total value and cattle for 15 per cent. Some iron, manganese, and hematite is mined. At the beginning of 1934 there were 8210 industrial establishments, employing 314,481 workers. The principal industries are woodworking, machinery, clocks, watches and jewelry, metallurgical production, clothing, cotton and silk textiles, and embroidery. The national income was estimated at less than 7,200,000,000 Swiss francs in 1935, against 7,420,000,000 francs in 1934 and 9,400,000,000 in 1929.

Foreign Trade. Excluding bullion and precious metals, imports in 1934 were valued at 1,434,506,000 Swiss francs (1,594,455,000 in 1933) and exports at 844,332,000 francs (852,785,000 in 1933). Imports from the chief sources of supply in 1934 were

(in 1000 francs): Germany, 388,527; France, 230,363; Italy, 116,048; United Kingdom and Irish Free State, 92,500. The distribution of exports by countries was (in 1000 francs): Germany, 182,493; France, 121,544; United Kingdom, 83,621; and Italy, 76,133. The value of the leading 1934 exports (million francs) was: Watches and parts, 109.1 cotton goods, 105.2; machinery, 93.4; silk goods, 91.6; dyes, 66.0; animal food substances, 42.0.

In 1935 imports totaled 1,283,280,000 francs; exports, 822,000,000 francs. United States imports from Switzerland in 1935 were \$16,272,190 (\$15,208,589 in 1934); exports to Switzerland, \$7,649,030 (\$8,425,454).

Finance. Actual budget receipts in 1934 totaled 453,584,820 francs (409,780,098 in 1933) and actual expenditures were 480,245,888 francs (482,061,122 in 1933). The deficit was 26,661,068 in 1934 and 72,281,024 in 1933. Budget estimates for 1935 were: Receipts, 436,300,000 francs; expenditures, 477,800,000 francs. The public debt on Dec. 31, 1934, totaled 2,265,685,000 francs (consolidated, 1,763,840,000; floating, 501,845,000), exclusive of the Federal railway debt of 3,074,377,000 francs. The Swiss franc (par value, \$0.3267) exchanged at an average of \$0.2471 in 1933 and \$0.3237 in 1934.

Communications. Including tramways and funiculars, Switzerland had 3607 miles of railway line in operation in 1934, of which 2638 miles were electrified. The Federal railways, with 1783 miles of line in operation, carried 114,293,000 passengers and 14,983,000 metric tons of freight in 1934. Total operating receipts were 333,587,000 francs and operating expenditures were 247,572,000 francs. Main automobile highway extended about 10,200 miles. In 1934 the Swiss domestic commercial aeroplanes flew 709,900 miles and carried 29,417 passengers. The Swiss and foreign lines carried 55,126 passengers and 1,656,175 lb. of mail.

Government. The Federal Assembly delegates executive authority to a Federal Council of seven members elected for three years. The chief magistrates are the President of the Confederation and the Vice President of the Council, who are elected by the General Assembly for one year. President in 1935, Rudolf Minger; Vice President, Dr. Albert Meyer.

History. In marked contrast with the methods of neighboring dictatorships, the Swiss people during 1935 decided several crucial issues in accordance with their well-tryed democratic governmental system. They charted their course through growing military, economic, and social perils by means of three referendums and one election. The first referendum, held on February 23, took place upon petition of Socialists, Communists, and others who sought the repeal of the law of September, 1934, extending the period for universal compulsory military training. This law was passed by the Federal Assembly by a vote of 291 to 11, following the reported discovery of German plans for an invasion of France by way of Switzerland in order to avoid the newly completed line of French fortifications along the Franco-German frontier. In the referendum, in which 80 per cent of the voters cast ballots, the measure was sustained by an unexpectedly close vote of 506,845 to 431,902.

Inspired partly by the Rooseveltian New Deal in the United States, the socialist, labor, and farm groups proposed a comprehensive programme for checking the economic depression, which, contrary to the tendency in the depreciated-currency countries, showed no evidence of lifting in Switzerland.

This so-called "crisis initiative" involved abandonment of the gold standard, devaluation of the Swiss franc, state control of industry, commerce, and banking; and state support of workers, aged persons, and others. The alternative, favored by the industrial and banking interests, was the continuance of the government's deflationary policy, with the reduction of wages and prices and the lowering of the standard of living. After being rejected by the National Council on March 28 and by the Council of States on April 5, the "crisis initiative" was submitted to a vote of the people on June 2. It was rejected by a vote of 566,242 to 424,878, with 83 per cent of the electorate voting.

The growing alarm and resentment of the Swiss people at the efforts of Italian Fascists and German Nazis to wean the Italian-speaking and German-speaking Swiss, respectively, away from their attachment to the Swiss republic became manifest during the year. In 1934 the German-speaking northern cantons had registered their hostility to Nazism. In 1935 the suppression by the Federal Council of the Fascist journal *Adula*, published in Italian-Switzerland, was seized upon by Fascist agitators as evidence of the "tyranny" of the German- and French-speaking Swiss over their Italian-speaking compatriots. In protest against this Italian propaganda, the Italian-Swiss held a huge demonstration at Lugano, at which all political parties declared their firm attachment to the Swiss republic.

The loyalty of the Swiss to the democratic republic was strikingly shown in a third referendum held on September 8 when a proposal for total revision of the Federal Constitution was defeated by a vote of 501,000 to 194,678. Defeat of the measure was attributed to fear that constitutional revision would open the door for the introduction of some form of fascism. The proponents of revision were split into many antagonistic groups, including Fascists desirous of limiting parliament's power, radicals who wanted to give labor direct class representation in the parliamentary system, and conservative Catholics who desired an authoritarian state on the Austrian model. Elections for the Council of States and the National Council, held October 27, resulted in radical gains at the expense of the Nationalist (Fascist) party.

Albert Meyer, Minister of Finance and a strong opponent of devaluation of the currency, was elected President for 1936 on Dec. 11, 1935. Giuseppe Motta, four times President of the Confederation, was chosen Vice President. Meyer's selection as President was significant in view of the increasing weakness of the franc and the large-scale hoarding, which was officially reported to have totaled 1,000,000,000 francs during 1935.

Swiss resentment at Nazi propaganda was aggravated by the kidnaping from Basle on March 9 of Berthold Jakob-Salomon, a refugee from Germany, who had written anti-Nazi newspaper articles. The Swiss Government formally protested to Germany on April 2 and held the alleged kidnaper, Dr. Hans Wesemann, as a hostage for Jakob's return. In May Switzerland invoked the German-Swiss arbitration treaty of 1921 to secure satisfaction. The same month the Swiss were again aroused by flights of German air squadrons over their territory. Switzerland's insistence finally led to Jakob-Salomon's return in September.

SYRACUSE UNIVERSITY. A nonsectarian institution of higher learning for men and women in Syracuse, N. Y., founded in 1870. The 1935 autumn enrollment was 5219. The summer session

had an attendance of 1828. The faculty numbered 664. The productive funds amounted to \$4,744,828, while the income for the year was \$1,666,502.37. The library contained 256,135 volumes. Chancellor, Charles Wesley Flint, D.D., LL.D.

SYRIA. A mandated territory of France situated north of Palestine on the Mediterranean coast. Capital, Beirut (Beyrouth).

Area and Population. Syria has an area of about 60,000 square miles, divided administratively as follows: Republic of Syria, including the autonomous Sanjak of Alexandretta, 49,200; Republic of Lebanon, 3600; Latakia, 2800; and Jebel Druze, 2400. The total population on Jan. 1, 1934, was estimated at 3,200,000. According to 1932 estimates, the population was divided as follows: Syria (capital, Damascus), 1,696,638; Lebanon (capital, Beirut), 862,618; Latakia (capital, Latakia), 286,920; Jebel Druze (capital, Es Suweideh), 51,780. Populations of the chief towns were: Damascus, 193,912; Aleppo, 177,313; Beirut, 134,655; Homs, 52,792; Hama, 39,960; Tripoli, 37,260; Antioch, 28,000; Latakia, 21,404. Arabic is the language most widely used. Of the total population, about 1,514,755 were Moslems.

Education. In 1933 there were 691 public schools, with 72,654 pupils; 1095 private schools, with 84,455 pupils; and 631 foreign schools, with 56,897 pupils. The Syrian University at Damascus had 391 students in 1933, the American and French universities at Beirut, 392 and 650 students, respectively.

Production. Agriculture and stock raising are the main occupations. About 2,500,000 acres were under cultivation in 1933. Production of the chief crops in 1934 was (in metric tons): Wheat, 395,700; barley, 242,700; oats, 14,500; corn, 29,300; rice, 900; potatoes, 40,200; tobacco, 3900; cottonseed, 5800; sesame, 2400; olive oil (1934-35), 9600; cotton, 2500; hemp, 600. Wool production in 1934 was 5400 metric tons. The production of raw silk for Syria and Cyprus in 1933 was 116,000 metric tons. Grapes, apricots, and other fruit are widely grown. The wine output of Lebanon in 1933-34 was 12,000 hectoliters. Livestock in 1934 included 1,962,000 sheep, 1,638,000 goats, 280,000 cattle, 160,000 camels, and 78,000 asses. Some iron ore and lignite are mined. Flour, oil, soap, silk thread, wine, and tobacco products are the chief manufactured products.

Foreign Trade. Imports into Syria, including Lebanon, in 1934 were valued at 2,981,760,000 piastres (3,774,960,000 in 1933) and exports totaled 819,480,000 piastres (844,320,000 in 1933). (Five piastres equals one French franc.) The chief sources of 1934 imports were: France, 482,380,300 piastres; Japan, 337,314,100 piastres; United Kingdom, 331,272,000 piastres; and Turkey, 240,877,000 piastres. United States statistics for 1935 showed imports from Syria of \$1,826,983 (\$1,142,541 in 1934) and exports to Syria of \$2,373,483 (\$2,235,341 in 1934).

Finance. Budget estimates for 1935 anticipated receipts and expenditures balancing at 13,821,617 Syrian pounds (1 Syrian pound equals 100 piastres or 20 French francs), as against actual receipts of 12,650,604 pounds and expenditures of 11,840,827 pounds in 1934. There was no public debt.

Communications. Syria in 1935 had 584 miles of railway lines, 6553 miles of highways, and air lines connecting Damascus with Bagdad and Beirut with Marseille. Motor bus routes linked Damascus and Bagdad, Beirut and Haifa, and Aleppo and Mosul. Extension of the northern Syrian rail-

way to the Iraq frontier was completed in 1935, as was the equipment of the telephone system with new wiring and semi-automatic apparatus. The French Army operated the telephone system. In 1933, 1723 vessels of 3,623,605 tons entered the ports, Beirut being the chief port of call. A five-year harbor improvement programme was under way at Beirut in 1935.

Government. By the Constitution of May 14, 1930, the Syrian Republic received powers equivalent to those of an independent state, except that the control of foreign relations and certain other functions were retained by France as the mandatory power. President in 1935, Mohamed Ali Bek el Abed, elected for five years on June 11, 1932. The Constitution of the Lebanese Republic was suspended in May, 1932, and the President was given dictatorial powers by the French High Commissioner. President in 1935, Habib Pasha es Saad. There was an appointive advisory council. Latakia and Jebel Druze were administered by French governors, assisted by partly nominated and partly elected councils. A French and colonial army of 316 officers and 13,655 men of other ranks was in occupation of the country. French High Commissioner in 1935, Count Henri de Martel.

History. A slight improvement in the badly depressed economic situation in Syria took place during 1935, despite the adverse influence of the Italo-Ethiopian conflict and the fluctuations of the French franc, upon which the Syrian currency was based. The economic upturn was too slight, however, to check the growing Nationalist agitation, which had harassed the French High Commissioner for a number of years. The movement had its roots partly in the desire for political independence and partly in the economic discriminations imposed upon the Syrian merchants and populace in general by the French administration. In 1935 the political movement gained strength as a result of the success achieved by the Egyptian Nationalists through a policy of violence (see *EGYPT* under *History*). New economic grievances also arose to stir Nationalist feeling. The French authorities were charged with exiling without a hearing Fakkri Bey el Baroudi, a Syrian leader who organized a boycott against the Belgian-owned electric power company which held the street-car and power concession for Damascus. The boycott was designed to force a reduction in allegedly exorbitant light rates and railway fares. It was also charged that the French maintained high tariffs on all imports except those from France and that they discouraged local industries which competed with French products.

On Nov. 22, 1935, the French attempted to break up a newly organized Nationalist party by arresting its leader, Antoun Saadeh, and 39 other prominent members on the charge that they had failed to register their party in accordance with the law. It was reported that the movement was secret and that it had a distinctly Fascist character. Its leaders were accused of planning to overthrow the French and British mandatory régimes in Syria and Palestine, respectively, and establish a united Syrian state to include the Syrian and Lebanese republics and Palestine. In January the authorities had taken similar drastic action to crush an alleged Communist movement. A number of radical newspapers published in Europe were banned and various radical meeting places were raided and closed. Instead of overawing the populace these forceful measures increased the prevailing unrest. The Nationalist agitation at the close of 1935 was assum-

ing menacing proportions in Damascus and the other principal cities.

TAJIK S.S.R. See *SOVIET CENTRAL ASIA*.

TANGANYIKA, tãng'gân-yè'kã, **TERRITORY.** The Territory in East Africa, mandated to Great Britain by the League of Nations. Area, 363,600 sq. miles; population (1931 census), 5,063,544 including 32,687 Asiatics and 8217 Europeans. Dar-es-Salaam, the capital, had 33,147 inhabitants.

Production and Trade. Sisal, cotton, groundnuts, hides, skins, coffee, copra, simsim, ghee, diamonds, gold, and timber (pencil cedar, yellow wood, mvule, ebony) were the main products. In 1935, imports were valued at £2,989,600 (£2,343,185 in 1934); exports, £3,445,143 (£2,645,283 in 1934) including sisal, £1,134,732; cotton, £569,547; coffee, £486,842; gold, £369,742; groundnuts, £210,018; hides, £131,265.

Government. Budget estimates (1935): revenue, £1,728,000; expenditure, £1,722,000. For 1936, revenue was estimated at £1,903,172 and expenditure at £1,860,651. Late in 1935, due to the improvement in railway earnings, it was anticipated that the Territory would end the year with a surplus of £150,000. The Territory was administered by a governor aided by an executive council of 6 members, and a legislative council of 23 members. Governor, Sir Harold MacMichael. See *KENYA* under *History*.

TANGIER. An internationally administered area in northwestern Morocco, near the Strait of Gibraltar. Area, about 225 square miles; population, about 51,000 (35,000 native Moslems, 11,000 Europeans, and 5000 Jews). Of the total population, about 45,000 live in the port city of Tangier. Commerce, agriculture, fishing, and the manufacture of cigarettes are the chief occupations. Wheat, barley, and chickpeas are the leading crops. Imports in 1933 totaled 68,795,047 French francs; exports, 9,306,987 francs. A railway linked Tangier with Fez, in French Morocco. Air lines extended from Tangier to Casablanca, Rabat, and Toulouse. There were about 65 miles of highways. In 1933 a total of 1786 ships of 2,922,912 tons entered the port of Tangier.

Tangier is permanently neutralized and demilitarized by the Convention of Dec. 18, 1923, as modified by the protocols of July 25, 1928, and November, 1935. For local government there is an international Assembly of 27 members, whose acts are subject to the veto of a Committee of Control composed of the French, British, Spanish, and Italian consuls in Tangier. Native affairs are in the hands of a Mendoub, representing the Sultan of Morocco. Administrator in 1935, M. Le Fur; Mendoub, Si Mehemed Et-Tazi.

History. Following British and Spanish demands for reforms in the administration of Tangier, a new agreement for the extension of the Tangier Statute to 1948, with certain modifications, was reached at Paris in the middle of November, 1935. The British had demanded a thorough-going reform of the judicial system and a reduction of Tangier's share of the charges on the French Moroccan loans of 1904 and 1910 and on the Tangier-Fez Railway loans. They pointed out that Tangier had run an annual budget deficit of about 3,000,000 francs, due to the heavy burden of the loan charg-

es. Spain also objected to France's predominant position in the Tangier administration and the high cost of the government. Under the new arrangement, the chief administrator of the zone was to be a Spaniard until May 14, 1948. Spain also was granted the right to appoint one director of the customs service, control of religious worship, and an additional member in the Legislative Assembly.

TARIFFS. See ARGENTINA, AUSTRALIA, BELGIUM, BRAZIL, CANADA, COLOMBIA, CUBA, FRANCE, GERMANY, GREAT BRITAIN, HONDURAS, IRISH FREE STATE, ITALY, JAPAN, NETHERLANDS, THE, NEW ZEALAND, NORWAY, PANAMA, POLAND, and SPAIN under *History*.

TASMANIA. A State of Australia. Area, 26,215; population (Mar. 31, 1935) 229,712. During 1934 there were 4470 births, 2345 deaths, and 1678 marriages. Chief towns (with June 30, 1933, census populations): Hobart, 60,408; Launceston, 32,841; Devonport, 5153.

Production. Wheat, oats, pease, fruits, potatoes, hops, and hay were the main agricultural products. Livestock in the State (1934): 2,035,052 sheep, 262,256 cattle, 30,299 horses, 38,126 pigs. Production (1934): Wool, 14,200,000 lb.; butter, 9,003,800 lb.; cheese, 1,551,000 lb.; bacon and ham, 1,951,651 lb.; wheat (1934-35), 316,000 bu. Mineral production (1934) was valued at £749,969 of which copper accounted for £267,342; tin, £219,246; coal, £81,262; gold, £48,139; silver and lead, £43,850. The value of production (1933-34) from the 899 factories, with 9782 employees, was £3,049,851 (Australian £ averaged \$4.0095 for 1934).

Government. For the year ended June 30, 1935, revenue amounted to £2,872,148; expenditure, £2,991,259; public debt, £2,835,354. Executive power was vested in a governor. Legislative power rested with a parliament consisting of a legislative council of 18 members elected for 6 years and a house of assembly of 30 members elected for 3 years. In the 1934 election the political parties in the House of Assembly comprised 15 Labor, 13 Nationalist, and 2 Independent. Governor in 1935, Sir Ernest Clark; Premier, A. G. Ogilvie. See AUSTRALIA.

TAXATION. Further additions to taxation both State and Federal had not been expected at the opening of the year 1935 and, indeed, Federal politicians had expressly declared that no further action for the installation of new taxes was contemplated. Both in State and in Federal finance, however, the year was productive of surprising increases in the severity and inclusiveness of taxation with the result that the close of the twelve-month found the general character of the load increased to a point close to that of the World War—in some respects greater than that produced by the war and later removed during the years directly subsequent to the struggle. At another point (See PUBLIC FINANCE, pp. 614-620) the factors which combined to bring about the result just referred to have been sketched. At this point it is sought merely to review the net outcome of the period so far as it affects changes in the tax system. See INTERNATIONAL LAW; AGRICULTURE.

Federal Taxation. The Federal administration had apparently not intended to suggest great changes in the revenue system and nothing of the sort was debated or planned in Congress until about midsummer when the President unexpectedly demanded the instant adoption of a tax measure designed to take away the larger incomes and inheritances above a substantial figure. This proposal was at once rejected on the ground that the

time allotted was too short. Eventually discussion resulted in agreement greatly to lengthen the session and to consider the subject in detail during the remaining summer months. Eventually there was enacted a measure approximating the form of law for which the President had asked (Aug. 19, 1935). The chief provisions of the act, so far as taxation itself was concerned, included (1) the imposition of a tax varying from present levels on the lower rates to practical confiscation on the higher incomes above \$10,000,000, with very greatly increased rates between the levels of \$1,000,000 and \$10,000,000. Inheritance taxation, in the same way, was enormously enlarged so far as related to incomes ranging from \$1,000,000 to \$10,000,000; while substantial advance of burden was made on all incomes through the adoption of new legislation which would compel the collection of very greatly increased totals. This new legislation, however, was not to become effective, so far as rates were concerned, until the 1st of January, 1936. So far as reports to the government are concerned it will not make itself felt through the change in administrative control until the first returns of 1936, to be filed on March 15. So far as actual payments on the higher incomes are concerned, the taxpayer will first actually feel it in the returns of Mar. 15, 1937.

The revenue yield of the year 1935 was thus a yield controlled by substantially the same conditions which were effective in the returns of Mar. 15, 1935. According to the Secretary of the Treasury, the effect of the legislation which controlled the returns of that year, was to bring about a very material enlargement of tax collections. The daily statements regularly published by the Treasury showed an aggregate of income tax receipts of \$554,814,928 on Dec. 31, 1935, as against \$420,550,247 a year previous. The report of the Commissioner of Internal Revenue for the year ending June 30, 1935 (fiscal year), which thus included the first half of the calendar year 1935, showed aggregate income taxes of \$1,099,230,000 as against \$817,425,000 for the preceding year; while miscellaneous internal revenue for the fiscal year 1935 was \$1,673,982,831 as against \$1,483,790,000 for the preceding year. These enlargements, however, were obtained at great cost in inconvenience and suffering on the part of the people—so much so that even the Congress of 1934-35 showed great reluctance and eventually practically refused to adopt a higher schedule of rates running down to the smaller incomes, which were proposed as a substitute for the emergency tax plan demanded by the President, as already outlined.

According to the U.S. Secretary of the Treasury in his annual report:

Income taxes. In the fiscal year 1935 income tax receipts aggregated \$1,099,100,000 as compared with \$818,000,000 in the fiscal year 1934, an increase of \$281,100,000. Receipts during the first half of the fiscal year 1935 were based largely on incomes for the calendar year 1933, and receipts during the second half, on incomes reported for the calendar year 1934. Receipts during the second half, therefore, reflected the higher levels of corporate and individual incomes during the calendar year 1934 as compared with 1933, as well as the changed provisions contained in the Revenue Act of 1934, which then became effective for the first time.

Collections of current corporation income taxes increased \$144,000,000 in 1935 over the preceding year, about 62 per cent of this increase occurring in the second half of the fiscal year. Among the changed provisions in the Revenue Act of 1934 affecting corporation income tax collections were the elimination of consolidated returns (except for railroad corporations), the imposition of a surtax on personal holding companies, and new provisions with regard to reorganizations. In addition, the Treasury changed its administration of depreciation allowances. The last-named

factor, together with the special efforts of the Bureau of Internal Revenue to collect back taxes on incomes, resulted in an increase of collections of \$45,000,000 during the fiscal year 1935.

Approximately 79 per cent of the increase of \$93,200,000 in current individual income taxes during the fiscal year 1935 was collected during the second half of the fiscal year and reflected, in addition to the higher level of individual incomes in 1934 as compared with 1933, the net effect of changes in the rate structure and in the capital gains and losses provisions incorporated in the Revenue Act of 1934.

Income Tax. Among the States, the important development of the year was, as in former periods, the rapid growth and extension of the income tax. Personal income taxes were enacted in California, Pennsylvania, South Dakota, West Virginia, and Washington, in addition to those already possessing that type of impost. An income tax law was also passed by the Colorado legislature, but it was vetoed by the governor. In North Carolina the existing constitutional income tax rate had been 6 per cent but in November the people voted to raise it to 10 per cent. In the new laws the rates proposed range from 1 per cent on the first \$5000 of income to 15 per cent on all over \$250,000. There was a marked tendency to increase rates and to lower exemptions in the States which already had an income tax on their statute books. Such increases were made in Alabama, Delaware, Idaho, Louisiana, Massachusetts, New York (through the retention of the "emergency" tax), North Dakota (through a revision of the brackets), and in other States alterations in exemptions which will result in making the burden materially larger.

The Sales Tax. Sales taxes have rivaled in popularity the demand for income taxes. In six States—Idaho, Maryland, Arkansas, New Jersey, North Dakota, and Wyoming—sales taxes were enacted, thus the total number with sales taxes was raised to 23. Some other States enlarged and amplified their preceding sales tax systems and in not a few gross income taxes were given up in favor of personal income taxes supplemented by retail sales taxes. Modifications broadening the sales tax system were enacted in Arizona, Mississippi, Missouri, New Mexico, North Carolina, and Oklahoma. Sales tax rates tended to become more uniform, being ordinarily 1 or 2 per cent flat. The retail sales, including amusements, although with some exemptions such as the sales of food and the like, have mitigated or limited the burden involved in the collection of this type of tax. Public utility services were usually exempt but they were now to be included as subject to sales taxes in Arizona, Arkansas, Colorado, Idaho, Missouri, New Mexico, North Dakota, Oklahoma, South Dakota, and Wyoming. "Relief" was still the major object for which sales taxes were collected, but this was by no means the exclusive pretext for the imposition of the impost. The popularity of the sales tax was unquestionably increasing and according to some able commentators it was probable that sales taxes, with the start they had now obtained, would remain as permanent features of the tax systems of the States in which they existed.

Chain Store Taxes. Chain store taxes have, likewise, grown in breadth of application and popularity. In 1935, California, Iowa, and South Dakota joined the group of 24 States which taxed chain stores. Two main types of taxation may be noted—the one a graduated tax varying with the store net receipts or with a number of stores, and the other a graduated tax varying with the volume of business. Rates varied to a considerable extent; the lowest rate in the country was that in South Dakota which had a license chain store tax rang-

ing from \$1 on the first store to \$10 on the tenth and each store over 10. Rates of chain store taxes were obviously increasing. Gross receipts sales taxes were usually $\frac{1}{2}$ of 1 per cent on receipts from one store, 1 per cent on those from 2 to 3 stores, and so on until a maximum rate of 5 per cent on gross receipts of each store was reached, if the chain included 16 or more stores. Other taxes designed to impede the development of the chain store business were, likewise, frequent.

Gasoline and Motor Taxes. Constant increase in gasoline tax rates was a feature of the past year. Alabama's 6 cent tax rate was made permanent. Delaware increased its rate to 4 from 3 cents, Nebraska to 5 from 4 cents, New York to 4 from 3 cents, Pennsylvania raised its rate to 4 from 3 cents, and Massachusetts extended its 3 cents tax until April 13, 1936; proceeds of the taxes instead of being used exclusively for the highways as formerly, were devoted, more and more, to "relief." Dealer taxes in the shape of bonds oftentimes as high as \$25,000, became more and more customary.

Tax Commissions. The feeling that all was not well with the tax situation and that the burden of taxes was growing more and more oppressive was evident in the changes that have taken place with regard to the supervision of taxation. In Alabama a State Tax Commission of three members was provided for, while New Mexico has created a Bureau of Revenue. Louisiana established a State Tax Board, and in Minnesota a special committee was named to study the present tax system and make recommendations for a better one. The Tax Revision Commission of New York State was continued for another year, and the Tax Survey Commission of North Dakota was directed to make a survey of the tax structure of the State which will more equitably distribute the burden. In a number of States important reports upon taxation were filed, although no important measures growing out of them were adopted. Included in such States were California, Connecticut, Florida, Iowa, Louisiana, Maine, North Carolina, Virginia, Wisconsin, and Wyoming; while special studies were made in a considerable number of the larger municipalities.

Liquor Taxes. Liquor legislation, during 1935, was extensive and conflicting. In two States—Alabama and Georgia—"dry" régimes were reinstalled. Control Boards were set up in Arkansas, Florida, Idaho, Nebraska, South Carolina, South Dakota, Utah, West Virginia, and Wyoming. In the latter State a liquor commission composed of the governor, secretary of state, and state treasurer was authorized to buy liquor at wholesale and dispense it to the public under specified conditions. Along with the liquor taxes and regulations of the past year have also gone taxes on racing, which became distinctly popular and proved a lucrative source of revenue.

Trends and Objects. On the whole, the experience of the year 1935 under State taxation was not very reassuring, either as to self-consistency or reasonableness. The search for new objects of taxation and the effort to raise rates to the point of maximum yield continued; but the inconsistencies and double taxation which had been characteristic of State systems in the past have hardly been reduced, while the efforts to find a new basis for taxation in various States have, in some cases, had the result merely of "crossing wires" and bringing about conflicts of policy with legislation already on the books.

See the articles on the respective States, under *Legislation*.

TAXONOMY. See BOTANY.

TELEGRAPHY. A new low flat rate for telegrams on holidays was introduced and attracted much new business. Facsimile sending by telegraph was perfected and introduced commercially. It is accomplished by a slightly different method than that used by the telephone service in that photographic recording and developing are not used. A new portable carrier-current system may be attached to any telegraph station in 10 minutes and provides an extra two-way circuit at points where it is expected that there will be an emergency demand for service. A non-portable eight-channel two-way carrier-current system may be added to any existing circuit so that 24 additional messages may be sent simultaneously over one pair of wires. By an intimate connection of land wires and ocean cables direct cable service is now available between London and Washington. This was inaugurated on May 1st with ceremonies in the Department of State. At the time of the Jubilee of King George there was direct communication between a news bureau in London and news bureaus in several American cities. The telegraph typewriter increased in popularity and is rapidly displacing the key and sounder. The New York stock market became so active that the ticker fell so far behind as to cause complaints from customers. Steps are being taken to increase its speed still further in spite of the fact that the ticker system was completely rebuilt a few years ago. The Western Union Company reported a business of about \$100,000,000 per year with a plant which is capable of doing a business of \$200,000,000 per year. This includes 1,865,000 miles of land wire and 30,784 nautical miles of ocean cable, 21,000 telegraph offices, and 15,500 telegraph agencies.

TELEPHONY. More than 450,000 telephones were added to the American system in 1935. Overseas services were further expanded by the addition of Iceland and the Dominican Republic to the foreign areas that may be reached by telephone. Ship-to-shore service was augmented by the inclusion of the steamships *Normandie* and *Transylvania* to the vessels equipped with apparatus for telephonic communication with land systems. At the end of the year approximately 93 per cent of the 34,500,000 telephones in the world could be reached from any telephone in the Bell System.

Coaxial Cable. Progress in the Bell Telephone Laboratories in the development of the coaxial cable reached a point during the year where it was deemed advisable to initiate an actual installation in the field in order to obtain experience with such practical problems as can not be explored in the laboratory.

In the trial installation proposed, a lead sheath cable of $\frac{3}{8}$ -inch diameter will be employed. This cable contains two coaxial circuits, one for either direction or transmission. Each coaxial circuit consists of an outer copper conductor in the form of a tape stranded tube, within which a copper wire is supported by a series of rubber disk insulators, the intervening space being filled with air or nitrogen gas. Besides acting as a conductor, the outer tube serves to shield the transmission path from undesirable external electrical influences. In such a cable the repeaters, which are under development, will be placed approximately 10 miles apart. At each repeater point, only a single repeater is necessary, this being capable of amplifying an entire group of 200 or more telephone channels.

Marine Radiotelephone Service. There has been a growing interest in a service for small coastal and harbor craft, such as fishing vessels, merchant craft, tugboats, coastal passenger ships, etc. Service of this kind in connection with the Boston fishing industry was opened for commercial use in 1934. Additional development in 1935 solved the problem of providing suitable radio compass equipment to fishing fleet owners, and other improvements have been made such, for example, as a selective signaling device such that the bell on each vessel is operated only in response to the particular code impulses to which its selector is adjusted. The fishing craft make use of the service normally for reporting details of the catch, for making arrangements to return to port, and in talking to other fishing vessels.

Switching System, New Type of. Announcement was made during the year of the development of a new automatic central office switching system for which engineering and manufacturing are in progress for trial installations. This new system will operate satisfactorily with existing switchboards of all types. It is expected to be applicable to use in large cities and, in addition, the flexibility and rugged construction of the new apparatus suggests its possible use also for other applications such, for example, as in central offices in small communities and in small private branch exchanges.

Telephone Call Around the World. In April, 1935, there was a demonstration of two-way telephone conversation entirely around the world, which employed the longest telephone circuit ever established. The call was routed from New York through San Francisco, Java, Amsterdam, London, and back to New York, the total length of the combined wire and radio telephone channels being more than 23,000 miles. The voice impulses covered this distance in a fraction of a second. This achievement was made possible by the cooperation of a number of telephone companies and administrations.

Telephone Set, New. Announcement was also made early in the year of a new telephone set, in the base of which are included the bell and other equipment hitherto mounted in a separate apparatus box, which is undergoing service trial. This new arrangement is the result of work of the Bell Telephone Laboratories which has made it possible to reduce the size and increase the efficiency of the different pieces of apparatus. The new design is expected to simplify installation and to improve the appearance and arrangement at the subscriber's telephone.

Telephotography. During the first part of the year, a nationwide telephotographic service was initiated employing a new system developed for use over the telephone wire network. This system transmits pictures of any size up to 11 x 17 inches with a structure of 100 lines per inch and at the speed of 11 sq. in. per minute. This speed of transmission is considerably faster than has been obtained heretofore from telephone circuits. The general method employed in picture transmission consists of analyzing or scanning in successive elements an area containing the graphic information and converting such information into some characteristic of an electrical current as a function of time. The resulting current is then transmitted to a receiving equipment where a process inverse to that employed for sending is used to reproduce the information in substantially the original form. In the network referred to provisions have been made whereby any one of a number of stations can send to or receive from the others on a broadcast basis.

Teletypewriter Exchange Service. In the nationwide teletypewriter exchange service, comprising about 150 central offices and several thousand stations and which grew from 5700 to over 7500 stations during the year, each of the largest offices has been equipped with a 3600-line multiple type switchboard which was designed specifically for the service. The remaining offices, which are too small to economically justify this large board had, prior to 1935, been using modified private wire telegraph switching arrangements. During 1935 a new 1200-line multiple type switchboard was made available and installed in several of these smaller centres. As the service improvements resulting from the use of this board are considerable, it is planned to apply it in all medium-sized and some of the smaller offices.

The increase of Teletypewriter Exchange Service during the year necessitated the assignment of about 100,000 more miles of telegraph facilities to this service, making a total of about 500,000 miles.

TELEVISION. There has been very little public demonstration or discussion of television in the United States during the year 1935. The RCA has appropriated one million dollars for research and a new transmitter has been installed on the Empire State Building. This company is using the cathode ray tube. Another inventor is working on the type using the electron beam focusing scheme which is designed to give 24 frames per second with 240 lines to the frame and project a picture on a disk up to 14 inches in diameter. Two large radio manufacturers are said to have taken out licenses under these patents. The mechanical system is still being advocated by one inventor who uses the Kerr Cell and revolving mirrors. Prof. J. T. Webb of the University of Minnesota announced that he would have a system in operation in 1936.

In Europe progress has been more definite and practical. The German government has one stationary and one portable station in operation and has engineers out making radio field surveys for 20 other stations to cover the centres of dense population. Germany is using 20 to 25 kilowatt short wave stations sending 24 frames per second with 180 lines per frame at present but is committed to 270 lines in the future. Orders have been placed with two large manufacturers for both the transmitter and the receiving sets. Germany has also a truck which seeks out news and action scenes, takes moving pictures and after developing the film sends out the pictures by short wave television within a few minutes. A major station picks up the transmission and re-broadcasts it.

France has been doing some experimental television broadcasting from the Eiffel Tower. In England the government has selected Alexandria Palace as the first transmitting station to cover the London district and is planning other stations. Two transmitters have been ordered, one Baird and one Marconi. Ultra short waves will be used. It is stated that receivers showing an 8 inch by 6 inch picture may be purchased for \$250.

Interesting by-products of the researches in television are the electron microscope and the electron telescope which use the cathode ray tube to receive, transmit, and enlarge pictures made by a lens. The magnitude of enlargement is said to be very great.

TEMPLE UNIVERSITY. A coeducational institution of higher learning in Philadelphia, Pa., founded in 1884. The 1935 autumn enrollment was 5702 in the three colleges of liberal arts, education, and commerce and 2133 in the eight professional

schools of chiropody, dentistry, law, medicine, oral hygiene, pharmacy, theology, and music. The 1935 summer session had an attendance of 1148. There were 738 faculty members. The income for the year ending June 30, 1935, totaled \$1,799,863. The library contained 112,784 volumes. President, Charles E. Beury, LL.D.

TENNESSEE. Population. On Apr. 1, 1930 (Fifteenth Census), 2,616,556; July 1, 1934 (latest Federal estimate), 2,676,000; 1920 (Census), 2,337,885. Memphis (1930) had 253,143 inhabitants; Nashville, the capital, 153,866.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1935	2,588,000	51,760,000	\$38,820,000
	1934	2,641,000	58,894,000	47,115,000
Cotton	1935	729,000	320,000 ^a	17,424,000
	1934	744,000	404,000 ^a	24,360,000
Hay (tame)	1935	1,164,000	1,149,000 ^b	11,260,000
	1934	1,226,000	1,089,000 ^b	14,593,000
Tobacco	1935	105,300	88,024,000 ^c	11,912,000
	1934	112,600	94,145,000 ^c	11,957,000
Sweet potatoes .	1935	59,000	4,720,000	2,596,000
	1934	60,000	6,180,000	4,079,000
Potatoes	1935	57,000	4,446,000	2,890,000
	1934	60,000	4,320,000	3,586,000
Wheat	1935	371,000	3,636,000	3,236,000
	1934	323,000	3,392,000	3,324,000

^a Bales. ^b Tons. ^c Pounds.

Mineral Production. The mining of coal increased again, to the yearly total of some 4,110,000 net tons (1935), from 4,135,790 (1934). The quantity for 1934 was still 25 per cent short of that for 1929; but this proportionate deficiency was less than the corresponding figure of 33 per cent for the Union as a whole. Most of the small production of iron ore was interrupted in 1934, to the contrary of the tendency in the main iron-mining States. Coke, however, was produced in the quantity of 76,591 net tons (1934), almost as great a total as for the year before. There continued a minor production of pig iron. The mining of zinc ores increased in the area formed chiefly by eastern Tennessee but including also part of Virginia; the zinc in the ore mined in 1934 rose to 47,712 short tons, from a total of 32,770 tons for 1933.

There occurred an increase in the mining of phosphate rock; the yearly quantity sold or used by producers rose to 425,952 long tons, including some contribution from Virginia, for 1934, from a corresponding 333,946 tons for 1933; the total by value rose to \$1,815,678, from \$1,373,392. The Tennessee Valley Authority made important commitments in 1934 with a view to developing the production of phosphate in the State; it more than doubled its leaseholds of lands bearing phosphate rock, to a total of 99 leases, covering a reported 15,980 acres by the end of the year, it also converted some of its electric furnaces in Nitrate Plant No. 2, at Muscle Shoals, into furnaces for reducing phosphate rock.

Education. For the academic year 1934-35, the number of those enrolled as pupils in the public schools of the State was reported as 640,037. Of these, 548,504 were in common schools or elementary grades, and the remaining 91,533 were in high schools. The expenditures of the year, for education in the public elementary and secondary schools throughout the State, totaled \$20,257,389. The salaries of teachers averaged, for the year, \$589.15 in the elementary positions and \$954.59 in the high schools.

Legislation. The regular session of the Legislature voted to authorize an issue of \$1,500,000 of

State bonds in order to furnish money with which to pay the State's part of the cost of support for its destitute unemployed. It passed statutes regulating the use of land; one of these created a system of zoning—giving authoritative classification to land with regard to the nature of its use. An effort to repeal the law against the teaching of the biological doctrine of evolution (which had been made an issue in the Scopes case in 1925) was defeated. The Legislature ended the tax-exemption of such property of churches, schools, and charitable and fraternal bodies as was used in competition with private business.

The Legislature met again in August to deal with old-age pensions, proposed taxation, and other matters.

Political and Other Events. The cost of public support for the needy unemployed ran well below the average per capita for the South as a whole. The \$13,340,384 paid out in Tennessee for this purpose in 1934—over 95 per cent of it by the Federal Government—came to some \$5 a head of the population, as against a corresponding rate of \$12, approximately, for the whole nation. The public works of the TVA within the State helped to keep unemployment down in 1935, as in 1934.

While the physical work of the TVA continued on a great scale, the question of its economic and social relations came more and more to the front. Chattanooga followed the example of Knoxville and Memphis in moving to change from private companies' service to the use of the TVA's electricity. In an election held on March 12 the voters of Chattanooga adopted a plan, urged by the Public Power League, for the issue of \$8,000,000 of municipal bonds with which to pay for a municipal system for the distribution of the TVA's current. The local act to which this vote gave effect set up a commission of four \$500-a-year laymen appointees and a lawyer to carry out the plan. The apparent expectation was that the local facilities of the Tennessee Electric Power Company could be bought for the city at an attractive price. That company, however, displayed no alacrity to sell its property and began lowering its rates to levels likely to reduce the chance of the industrial customers' patronizing a municipal system.

Work on the Norris Dam proceeded, encouraging expectation that it would reach completion in May, 1936, and that electricity could be delivered from that source to Chattanooga and other communities soon thereafter. At Knoxville, on May 17, was held a great and enthusiastic celebration of the second "birthday" of the TVA, which served as a demonstration of endorsement from many parts of the State. Soon afterward, however, sentiment was affected by the proceedings before the House of Representatives' committee on military affairs; the audit, there presented, of the Federal Comptroller-General, indicating that the TVA had valued at \$51,000,000 properties on which \$132,792,000 had been spent and had reported expenditures of some \$12,000,000 as against \$1,345,000 of receipts, drew attention; while testimony that the TVA had bought small plots in order to interfere with projected hydroelectric developments of the Aluminum Company of America roused fears that the TVA, while ostensibly attracting industries to the State, might actually drive that particular industry out of it.

While the subject of the TVA thus led to controversy among some elements in the State, the prevailing feeling continued to reflect a realization that the Federal Government was spending many

millions in Tennessee and likely to spend more on new dams and plans for promoting industries and use of lands.

Joseph I. Reece, former Commissioner of Insurance and Banking, who had been ousted from office some time before, was convicted of having stolen \$90,000 of bonds held by the Insurance Department and was sent to the State Penitentiary on July 6. See FLOODS.

Officers. The chief officers of the State, serving in 1935, were: Governor, Hill McAlister; Treasurer, James J. Bean; Comptroller, Roy C. Wallace; Secretary of State, Ernest N. Haston; Auditor, Lyon Childress; Attorney-General, Roy H. Beeler; Commissioner of Education, Walter D. Cocking.

Judiciary. Supreme Court: Chief Justice, Gratton Green; Associate Justices, A. W. Chambliss, Colin P. McKinney, W. H. Swiggart, William L. Cook.

TENNESSEE, UNIVERSITY OF. A State institution of higher education, nonsectarian and coeducational, in Knoxville, with colleges of medicine and dentistry and schools of pharmacy and nursing in Memphis and a junior college in Martin, founded in 1794. The total enrollment for 1934-35 was 3637 of whom 1315 were registered in the summer session. The faculty numbered 161. The endowment funds amounted to \$457,768; the income for the year 1934-35 was \$1,693,873. The library contained 156,266 volumes. There was under construction in Knoxville an administration building and a building for the department of biology, in Martin a dining hall, and a student activities building in Memphis. President, James D. Hoskins, LL.D.

TENNESSEE VALLEY AUTHORITY (TVA). See DAMS; MUNICIPAL OWNERSHIP; TENNESSEE; UNITED STATES.

TENNIS. A pair of lawn tennis matches, among the most sensational ever played in the game, overshadowed all else in the sport in 1935. The first was on Wimbledon's famous court where Mrs. Helen Wills Moody, back in competition after a two-year absence, staged a great rally to turn back Miss Helen Jacobs after trailing 2-5 in the third set and was within a single stroke of defeat. The other sensation was staged at Forest Hills, L. I., where Frederick Perry, England's great player who had earlier in the year helped his country to retain the Davis Cup, yielded his national singles crown to Wilmer Allison in the outstanding upset of the campaign.

Mrs. Moody's triumph over the rival who had been leading her in 1933 when an injured back caused her default, was as hard won as any in her long career. After a quick decision to reenter competition, Mrs. Moody took a hurried trip from her home in California to England. She played in the Queens Club tournament and was beaten in the final by Miss Kay Stammers, pretty English girl. Then she and Miss Jacobs worked their respective paths to the Wimbledon final and the eyes of the sports world were upon them. Mrs. Moody won the first set but Miss Jacobs was strong in the second, and from 2-all in the third rushed into a 5-2 lead. Then began one of the great rallies of the game, which ended only when Mrs. Moody had captured the Wimbledon title for the seventh time, equaling the record of Mrs. Lambert Chambers. Miss Jacobs returned home to lead the United States to Wightman Cup victory over England and then to capture her fourth national singles crown in a tournament not entered by Mrs. Moody.

Perry's loss to Allison, the veteran campaigner,

was surprising to say the least, and took place in the semi-final of the tournament after the Briton, who had retained his Wimbledon title in June, had swept through the early rounds with a show of skill considered unmatchable by any other player in the tournament. Allison played beautifully against Perry and after the defending champion had fallen heavily and twisted his knee in the first set, Allison forged ahead and eliminated the champion in three straight sets and the following day crushed Sidney B. Wood in the final to gain his first major singles crown in a career of distinguished achievements and heart-breaking frustrations. Allison's victory over Perry, who had beaten him two months before in Davis Cup play and in the national final in 1934, and over Wood constituted one of the most amazing comebacks in the sport's annals.

Despite the defeat at Allison's racquet, Perry, winner of the British and French championships, in each of which he downed Jack Crawford in the semi-final and Baron Gottfried von Cramm of Germany in the final; runner-up to Crawford in the Australian championship and victor over Allison and Donald Budge in the challenge round of the Davis Cup, remains the outstanding amateur singles player of the world.

Allison and John Van Ryn won the national doubles crown and the women's honors went to Miss Jacobs and Mrs. Sarah Palfrey Fabyan. Mrs. Fabyan and Enrique Maier of Spain were best in the mixed doubles. Jack Crawford and Adrian Quist, the Australian pair, won the doubles at Wimbledon, where the women's doubles went to Miss Stammers and Mrs. Freda James of England. Gregory Mangin won the national indoor title for the second consecutive year, and teamed with Berkeley Bell to take the doubles championship. Miss Jane Sharp, Pasadena, Calif., girl, won the women's indoor laurels and Mrs. Dorothy Andrus and Mme. Sylvia Henrotin of France won the doubles. Miss Sharp and Mangin took the mixed doubles.

TESCHEN. See CZECHOSLOVAKIA and POLAND under *History*.

TEXAS. Population. On Apr. 1, 1930 (Fifteenth Census), 5,824,715; July 1, 1934 (latest Federal estimate), 6,073,000; 1920 (Census), 4,663,228. Houston had (1930) 292,352 inhabitants; Dallas, 260,475; San Antonio, 231,542; Fort Worth, 163,447; Austin, the capital, 53,120.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1935	10,606,000	3,050,000*	\$166,835,000
	1934	10,297,000	2,406,000*	150,469,000
Corn	1935	5,403,000	105,358,000	52,679,000
	1934	5,097,000	45,873,000	38,075,000
Wheat	1935	1,430,000	10,010,000	8,408,000
	1934	2,861,000	25,749,000	20,084,000
Grain sorghum .	1935	5,480,000	65,760,000	29,592,000
	1934	4,482,000	17,928,000	17,390,000
Oats	1935	1,701,000	39,123,000	12,911,000
	1934	1,546,000	32,466,000	13,960,000
Rice	1935	166,000	8,632,000	5,697,000

	1934	66,000	3,300,000	3,234,000
Potatoes	1935	54,000	3,240,000	3,402,000
	1934	54,000	3,780,000	4,234,000

* Bales. ^b Tons.

Mineral Production. A desired decrease in the production of petroleum took place in 1934; it car-

ried the yearly total of the product moderately down, to some 380,820,000 barrels, which was about 22,000,000 less than the total for 1933. The decline marked greater success in the enforcement of restriction by public authority, in the East Texas area. Over the rest of the State the production was higher as a whole for 1933, though not universally so. The yield of the East Texas area fell to 181,143,000 barrels (1934) from 204,954,000 (1933). The reported production of petroleum for 1934, stated above, included an estimated 22,500,000 barrels of illicit production ("hot oil"). The new wells completed in 1934 were numerous but did not disclose strikingly important fresh sources of petroleum.

There were brought into production, in 1934, 279 new natural-gas wells. A number, particularly in the southwestern part of the State, revealed new gas-yielding fields. Some 175,000,000 M cu. ft. of gas were burned in 1934 to produce carbon black, of which the yield was about 260,000,000 pounds and the value \$9,200,000. Great quantities of natural gas—644 billion cu. ft. in the Panhandle alone—were treated for the extraction of gasoline, and 463,400,000 gallons of gasoline were thus produced in 1934.

There were produced in Texas, in 1934, 1,187,678 long tons of sulphur; at the uniform quoted price of \$18 a ton, the indicated selling value of this product approximated \$21,370,000.

Education. The number of the population of school age (from 6 to 17 years, inclusive), was reckoned for the academic year 1935-36 as 1,558,855. This was about 0.1 per cent less than the figure set for the year before. But the State's *pro-rata* contribution to the support of the public schools, based on the population of school age, was increased for the year 1935-36 to \$17.50 for each person of school age, from \$16.50 for the year previous. Other forms of State aid to the public schools came to some \$5,000,000 a year, and the combined grants of the State to the schools furnished 60 per cent or more of their yearly expenditure as a whole. No later figures on the operations of the public schools had been collated than those for the academic year 1933-34, shown in the NEW INTERNATIONAL YEAR BOOK, 1934, p. 687.

Charities and Corrections. Heavy expense incurred in meeting the State's part of the joint Federal and State contribution to support destitute inhabitants led the State to sell on July 24 the last part of the \$20,000,000 of Relief Bonds that it had authorized for this purpose. It was expected that \$18,500,000 of the whole proceeds of the issue would have been spent by the close of 1935 and that there would remain about \$500,000 a month for the first three months of 1936.

The dispensation of aid to the destitute unemployed in the State was administered by the State Board of Control, under an act of 1934. This Board continued with its duties as to the State institutions for the care of persons and its function as purchasing agent for all State institutions and departments. It exercised control over the eleemosynary institutions, but not over the State Prison, administered by a manager. Three appointed members serving overlapping terms of six years composed the Board.

Institutions under its authority and the respective numbers of their inmates on September 30, 1935, were: For mental disorders, the Psychopathic Hospital, at Galveston (52), and State hospitals at Austin (2317), Rusk (2040), San Antonio (2554), Terrell (2364), and Wichita Falls

(2143); for epileptics, Abilene State Hospital (1088); School for the Blind (213), Austin; School for the Deaf (501), Austin; Deaf, Dumb, and Blind Institute for Colored Youths (184), Austin; Confederate Home (110), Austin; Confederate Women's Home (91), Austin; State Orphans' Home (641), Corsicana; State Colored Orphans' Home (99), Gilmer; Home for Dependent and Neglected Children (361), Waco; Juvenile Training School (795), Gatesville; Girls' Training School (235), Gainesville; Austin State School (feeble-minded, 1125), and Farm Colony Branch (159), Austin; State Tuberculosis Sanatorium (705), at Sanatorium. A Hospital for Crippled and Deformed Children (31 patients), at Galveston, was administered by the School of Medicine of the University of Texas.

The State appropriated \$200,000 in 1935 to build a sanatorium for tubercular Negroes.

Legislation. The regular session of the Legislature sent to the people, for their final action by referendum, seven proposed amendments to the State constitution. The repeal of the State's constitutional prohibition of the traffic in alcoholic beverages was one of these. Another authorized the payment of pensions of not over \$15 a month each, to inhabitants 65 years old or over who were not habitual drunkards, criminals, nor inmates of State-supported institutions. Other amendments among the proposed seven abolished the remuneration of public officers by fees, called for the State's supplying textbooks to public and also to private schools, accorded the right to commit insane persons, by due means, without trial by jury, permitted judges to suspend sentences imposed on criminals, and allowed special legislative sessions to consider amendments to the constitution.

An act of 1933 allowing uncontrolled release of natural gas for the extraction therefrom of gasoline and for the production of carbon black was repealed, in response to the view that this had wrought much depletion at small return. Two acts furthered the State's efforts to enforce its limitation of the output of petroleum: one increased by $\frac{1}{8}$ cent a barrel the State's tax on produced petroleum in order to meet the expense of the forces charged with preventing violation; the other sought to prevent the transportation of unauthorized petroleum ("hot oil") by truck and authorized the confiscation of the quantity (an estimated 3,000,000 barrels) of this article then in storage in the State. The creation of a system of State police, to supplant the old volunteer organization of Texas Rangers, was authorized.

Special Sessions. A special session convened in September to deal with the creation of a system of control over traffic in liquor, with taxing such traffic, and with the general subject of revenue for the State government and for the subdivisions, with which to pay public officers who had been supported by fees. It failed to enact the chief part of its programme. A second special session, assembling in October, considered legislation to harmonize with the Federal Social Security Act. It passed a measure creating old-age pensions.

Political and Other Events. Governor James V. Allred was inaugurated on January 15. His policy favored the effective protection of the State's deposits of petroleum and natural gas from wasteful exploitation and the early removal of the unemployed, from dependence on public sustenance, to work on public undertakings.

Texas, as a prevailingly Democratic State, was basically affected in its system of partisan politics

by a decision of the Federal Supreme Court as to the status of Negroes in that party. The Court held on April 1 that a Negro, R. R. Grovey, who had brought suit on the ground of his exclusion from the polls at a Democratic primary election, had not been deprived of any constitutional right. The Court held the Democratic party in Texas to be a voluntary organization "competent to decide its membership," and held valid the State Democratic Convention's declaration of 1932 limiting the party membership to whites. The same court had earlier set aside statutes of Texas authorizing the State Democratic Executive Committee to refuse the ballot to Negroes. The strength of the Democratic vote in the State rendered the unsailed right of the Negro to vote in the final elections nearly nugatory, since the Democratic choice at the primaries determined the ultimate outcome almost always with regard to general offices.

The State was recognized by a decision of the State Supreme Court as still holding title to the mineral deposits in lands, some 3,901,000 acres in extent, of school-grant tracts that had been forfeited and repurchased under an act of 1925. The matter involved the State's participation in over \$1,000,000 collected or due and other sums to accrue later to the State's school fund from rents and royalties payable for the exploitation of petroleum. With regard to the State's limitation of the output of petroleum the Federal Supreme Court refused to review the imprisonment, for contempt of court, of a producer of petroleum who had failed to obey a court's order restricting his production while a charge of exceeding his quota was pending.

A State election was held on August 24 to effect popular action on the seven proposed amendments to the State constitution submitted by the Legislature. The amendment repealing the prohibition of traffic in alcoholic liquor was adopted by 297,597 votes against 250,948. The amendment authorizing a system of State pensions to the elderly was ratified by a heavy majority. The voters also approved the amendment abolishing the payment of public officers by fees. Such payment had already been abolished with regard to the leading counties.

Governor Allred held that the vote for repeal rendered it useless to continue the State's far from wholly successful efforts to enforce prohibition. The failure of the Legislature to enact any measure in September for the control of the liquor traffic left the situation at loose ends, liquor being sold more or less at will.

A comparatively good cotton crop brought money to farmers in great number and helped toward righting the economic situation of Texas. The situation in 1934 had been adverse; according to the FERA's figures for that year, not to count special expenditure for aid to the agricultural class, \$36,014,837 had been paid for the support of the destitute unemployed, nearly 61 per cent of it by the FERA and almost all the rest by the State government. Conditions both on farms and in general business improved after the harvest of 1935.

The cotton growers of the State had seen their brethren in other cotton States make money in 1934, when drought cut their own yields of cotton down. Eager to recoup, they felt themselves, in some cases, held back by the Federal Administration's system of restricting acreage planted to cotton. Sentiment in the State therefore strongly favored the plan for the payment of Federal benefits on exports of cotton, advanced by Senator Connally of Texas and written into the act amending the AAA. The State, which had formerly exported

nine-tenths of its cotton crop, particularly felt the decline of foreign purchases under the "New Deal." Hand in hand with this sense of loss went a feeling of doubt as to the New Deal, apparent in the State convention of Young Democrats at Amarillo in June, which rebuffed the President's son Elliott Roosevelt by passing a resolution in favor of States' rights and condemning Federal Constitutional change.

Breaking a drought of many months' duration, torrential rains fell in central and southwestern Texas in the middle of June. Floods occurred in a number of areas, causing 15 deaths and heavy loss in property and crops. See DUST STORMS; FLOODS.

Officers. The chief officers of the State, serving in 1935, were: Governor, James V. Allred; Lieutenant-Governor, Walter F. Woodul; Secretary of State, R. B. Stanford; Treasurer, Charley Lockhart; Comptroller, George H. Sheppard; Attorney-General, William McCraw; Superintendent of Public Instruction, L. A. Woods.

Judiciary. Supreme Court: Chief Justice, C. M. Cureton; Associate Justices, Richard Critz, John H. Sharp.

higher education for men and women, founded in Austin in 1883. For the autumn of 1935 the enrollment at the main university totaled 7771; that at the medical branch in Galveston was 475. The 1935 summer session had an attendance of 5435. There were 483 members on the faculty. The endowment resources (in part for the Agricultural and Mechanical College of Texas) amounted to more than \$33,000,000. The libraries contained 493,155 volumes. Buildings under construction or definitely scheduled for 1935-36 were: Main Building-Library (second unit of Library, in course of construction); two dormitories for men and two for women (one for men and one for women in course of construction); Museum, McDonald Observatory (at Mt. Locke, in course of construction). President, Harry Yandell Benedict, Ph.D.

TEXAS TECHNOLOGICAL COLLEGE.

A State coeducational institution at Lubbock, Texas, opened in 1925. The enrollment for the fall semester of 1935-36 is 2441 (agriculture, 264; engineering, 451; home economics, 266; arts and sciences, 1460). During the summer session of 1935 there were 1956 students enrolled. The teaching staff for 1935-36 numbers 138. The State appropriation for salaries and maintenance amounts to \$353,840; and the State appropriation including the summer session, \$374,525; the income from student tuition was estimated at \$136,000. The library contains 49,117 catalogued volumes and

public documents. President Bradford Knapp, LL.B., D.Agr.

TEXTILE INDUSTRY. The year 1935 fulfilled expectations by proving to be the most satisfactory in the textile industry since 1929. According to the annual review number of *Textile World*, upon which this article is based, activity in the textile field aggregated 5 per cent above the normal activity on the basis of the 1923-25 average, was 17 per cent higher than in 1934, and was only 10 per cent below the peak of 1929. Improved activity, however, was not uniform in all the major branches of the industry. Cotton consumption registered only a 4 per cent gain over the previous year and was 8 per cent less than the 1923-25 average. Silk consumption, though 7½ per cent above that of 1934, and 21 per cent over the 1923-25 average, was still far below the 1929 peak. Wool consumption and rayon consumption staged the greatest activity, the former being almost double that of 1934 and 41 per cent above the 1923-25 average, and rayon gaining 29 per cent over 1934 and more than five times the 1923-25 consumption. See STRIKES AND LOCKOUTS; LABOR ARBITRATION AND CONCILIATION.

THEATRE. See DRAMA; FRENCH LITERATURE; GERMAN LITERATURE; LITERATURE, ENGLISH AND AMERICAN; ETC.

THEOSOPHICAL MOVEMENT, THE. The Theosophical Movement can be traced throughout history, wherever thought has struggled to be free and wherever spiritual ideas, as opposed to form and dogmatism, have been promulgated. Theosophy is not a creed but a statement of the laws that govern evolution—physical, intellectual and spiritual—as those laws have been handed down and restated periodically by a long line of spiritual teachers. The Theosophical Movement is not confined to any organization but is made up of those who work for the spreading of these ancient truths, which constitute an inspiring and an all-embracing philosophy of life, rooted in the concept of the unity of all life.

Theosophy teaches that the Deity is a Boundless, Immutable, and Impersonal Principle, which is everywhere present but is inconceivable by human intellect; that man is a soul evolving gradually towards the perfection which the Buddhas and Christs of the race exemplify, and that evolution takes place, life after life, in accordance with the efforts of each and under the unerring working of the universal law of action and reaction, cause and effect, which the Orientalists call Karma and which is itself an aspect of the Unknown Deity.

The outstanding event connected with the The-

osophical Movement in 1935 was the death of George Russell (q.v.) who, under the pen name Æ, had been familiar for many years to all lovers of the poetry of mysticism. His vital connection with Theosophy as restated by Madame H. P. Blavatsky, from his young manhood to his death, was strikingly set forth in *The Aryan Path* for December, 1935.

THEOSOPHICAL SOCIETY IN

AMERICA. The American section of the Theosophical Society, a world-wide organization founded in New York in 1875 by Mme. Helena P. Blavatsky and Col. Henry S. Olcott. World Headquarters were later established by them at Adyar, India, near Madras. In 1935 branches existed in 49 nations, on six continents. The Theosophical Society in America had, in 1935, 154 local lodges. The president of the society was Sidney A. Cook. Headquarters are in Wheaton, Ill.

THIRD INTERNATIONAL. See COMMUNISM.

THOMAS, M(ARTHA) CAREY. An American educator, died in Philadelphia, Pa., Dec. 2, 1935. Born in Baltimore, Md., Jan. 2, 1857, she was graduated from Cornell University in 1877 and was elected to Phi Beta Kappa. Desirous of continuing her studies, she persuaded the trustees of Johns Hopkins University to allow her to attend a seminar there. She studied at the University of Leipzig (1879-82), but a new ruling prevented her from receiving the doctorate degree. Finally, after a stiff examination, the University of Zurich gave her the degree of Ph.D., *summa cum laude*, and she was the first woman to receive such a degree from a European university. From 1882 to 1883 she studied at the Collège de France and the Sorbonne, and when she returned to America in 1884, she was appointed dean, professor of English, and an organizer of Bryn Mawr College.

She held the post of professor of English and dean until 1894, and was the first American college official to use the title of dean, which was an English importation. She was then elected president of the College, and in 1903 became a life member of the board of trustees. To Miss Thomas must go the credit for the organization of the Bryn Mawr curriculum on the now-famous "group system," with an undergraduate course of four years and a graduate course of three years leading to the Ph.D. degree. Self-government for the students was inaugurated and an exchange system of professors evolved. In 1910, the first graduate School of Social Economy and Social Research in the United States was founded by her at the College, and in 1922 the first School for Workers in Industry was established under her guidance on the campus. In 1922 when she retired as president emeritus, the Alumnae established the M. Carey Thomas Prize to be "given at intervals to an American woman in recognition of eminent achievement" and awarded it first to her. In this year she also was awarded the degree of LL.D. by Johns Hopkins University, the first woman to be so honored.

Besides her activities connected with Bryn Mawr, she founded, with Mary Elizabeth Garrett, in 1885, the Bryn Mawr School for Girls and served as treasurer of the corporation (1890-1915) and as chairman of the board (1915-1927). Eight years after the founding of this school, she and Miss Garrett succeeded in raising a \$500,000 endowment for the newly-formed Medical School at Johns Hopkins on the condition that women were to be admitted on an equal footing with men

students. From 1915 she served as chairman of the women's advisory committee of the Medical School. The question of woman suffrage captured her interest and from 1906 to 1913 she was president of the National Collegiate Equal Suffrage League. Also, she was a founder of the Association to Promote Scientific Research by Women and of the International Federation of University Women.

Her publications include *Sir Gawain and the Green Knight* (1893), the thesis written for her degree; a monograph on *The Higher Education of Women* (1900), prepared at the request of the U.S. Department of Education, and which received a gold medal at the Paris Exposition of 1900 and at the St. Louis Exposition of 1904; *Should the Higher Education of Women Differ from That of Men?* (1901); and a *Statistical Study of Coeducation in the United States for The Encyclopedia Americana*, as well as many articles on education and topics of interest to women.

TIBET, ti-bét'; tib'et. A central Asian territory, nominally under the suzerainty of China. Area, 463,200 sq. miles; population, 2,000,000. Lhasa (capital), had about 20,000 inhabitants. Agriculture was the main industry. Tibet's first factory, built at Tapchi and operated by electricity produced by water power, is now engaged in making copper coins, paper money, and army uniforms and equipment.

History. The report published in 1934 that an infant had been selected to succeed the Dalai Lama, who died Dec. 17, 1933, proved to be erroneous. It was announced in July, 1935, that the search for the new Dalai Lama had officially begun. The Tibetans believe that when the Dalai Lama, the spiritual and temporal ruler of the country, dies his spirit passes directly into the body of a new-born child. The latter was to be identified by certain marks on his body and by his ability to handle instinctively the rosary, bell, and other personal belongings of the departed ruler.

Meanwhile the Chinese Nationalist Government at Nanking was continuing its efforts to strengthen its nominal suzerainty over Tibet. The last Dalai Lama, being hostile to Chinese rule, had administered his country as a virtually independent State. A Chinese mission sent to Tibet in 1934 to induce it to reenter the Chinese republic returned unsuccessful, but another mission in 1935 appeared to have paved the way for a rapprochement. The mission went ostensibly to honor the late Dalai Lama, whose remains were transferred to a newly completed tomb in 1935. The mission used its influence on behalf of the Panchan or Teshu (Tashi) Lama, second in rank to the Dalai Lama in the Tibetan clerical hierarchy, who had been in exile in China since 1924. Later in the year it was reported that the Panchan Lama was returning to Tibet, a development which was regarded as favorable to the restoration of Chinese authority.

TIMOR, té-môr', PORTUGUESE. The eastern part of the island of Timor together with the territory of Ambeno and the nearby islands of Pulo Caming and Pulo Jako, forming colonial possession of Portugal. Total area, 7330 sq. miles; population (1931), 474,363. Capital and port, Dilli. Copra, coffee, sandal-wood, sandal-root, and wax were the principal exports. In 1932, imports were valued at 1,403,563 patacas; exports, 691,269 patacas. The decree of May 9, 1935, changed the fiscal year to agree with the calendar year and approved the budget expenditure of 28,400,352 paper escudos

(escudo was worth \$0.0449 on June 13, 1935) for the 18 months ending Dec. 31, 1936.

TIN. According to the American Bureau of Metal Statistics the world production of tin in ore in 1935, in terms of recoverable basis, is shown in the accompanying table. Accounting is on the basis of exports in most instances rather than actual production. The figures for Bolivia, Netherlands India, Malaya, Nigeria, and Siam are as communicated through the International Tin Committee.

WORLD TIN OUTPUT, 1935 (LONG TONS)

Australia *	3,050	Japan *	2,060
Bolivia	27,168	Nigeria	6,949
British India *	3,625	Siam	9,779
China *	8,675	South Africa	615
Netherlands India ..	24,613	Great Britain * ...	1,782
Malaya	45,939	Elsewhere *	8,600
Indo-China *	1,210	World total ..	144,065

* Preliminary. * Mainly Belgian Congo.

The visible supply of tin in all quarters was 15,318 tons on December 31, as compared with 18,172 tons at the close of 1934. The average price of Straits tin in New York for the year was 50.39 cents ranging from a low of 45.75 cents in March to a high of 54 cents in October, and closing the year at 48.60 cents. Imports into the United States in 1935 from all sources aggregated 58,779 tons, as compared with 41,349 tons in 1934. In the 12 months ending Oct. 31, 1935, the consumption of tin by other leading countries were: United Kingdom, 21,881 tons; Germany, 10,943 tons; France, 8,204 tons; Russia, 7,004 tons; Italy, 5,307 tons.

TIROL. See AUSTRIA.

TOBACCO. The tobacco crop in the United States in 1935 was estimated at 1,283,742,000 lb., an increase of about 23 per cent from the 1934 crop of 1,045,660,000 lb., yet somewhat below the 5-year (1928-32) average production of 1,432,845,000 lb. The harvested acreage totaled 1,458,300 acres, compared with 1,270,600 in 1934, while the 1935 average acre yield was 880 lb., compared with 823 in 1934. Based on the December 1 estimate of the average farm price of 18.5 cents per pound, the farm value of the 1935 crop would total \$237,479,000, which did not include rental and benefit payments to tobacco growers, estimated at about \$30,000,000 for 1935.

Production by types was estimated for flue-cured, 785,993,000 lb.; fire-cured, 120,887,000; air-cured, light, mostly Burley, 260,711,000; air-cured, dark, 33,871,000; cigar types, 82,105,000, comprising filler 42,530,000, binder 32,090,000, and wrapper, 7,485,000; and miscellaneous, 175,000 lb. The increased production for all types over 1934 was accounted for mainly by an increase of about 230,000,000 lb. or about 41 per cent in flue-cured tobacco. North Carolina retained the lead of the producing States with 561,060,000 lb., and was followed by Kentucky with 247,429,000; Virginia, 95,500,000; South Carolina, 89,725,000; Tennessee, 88,024,000; Georgia, 68,053,000; Pennsylvania, 26,910,000; Maryland, 26,350,000; Ohio, 21,986,000; Connecticut, 16,905,000; Wisconsin, 14,700,000; and Florida, 8,680,000 lb. In regard to the tobacco programmes inaugurated under the Agricultural Adjustment Act and supplemental legislation, see AGRICULTURE, under *Agricultural Adjustment*.

The 1935 crops of tobacco in other important producing countries, as estimated by different official agencies, were for Japan, 149,055,000 lb.; China (flue-cured), 155,000,000; Greece, 92,509,000; Turkey, 74,186,000; Hungary, 41,486,000; Bulgaria, 74,186,000; Czechoslovakia, 27,812,000;

Algeria, 38,581,000; Yugoslavia, 24,251,000; Belgium, 15,873,000; Brazil, 57,750,000; Canada, flue-cured 35,000,000 and Burley 10,500,000; and Cuba, 41,913,000 lb. The 1934-35 crop of Germany was estimated at 76,736,000 lb. and of Siam at 20,467,000 lb.

Collections from internal revenue taxes on tobacco in the United States for the fiscal year 1935 amounted to \$459,178,625, an increase of \$34,009,728, or 8 per cent, compared with the previous year. Receipts from taxes on small cigarettes amounted to \$385,459,570, which was 84 per cent of the total taxes collected on tobacco, and \$35,797,625 over 1934. The taxes collected on smoking and chewing tobacco declined to \$54,372,414 in 1935 from \$55,298,629 in 1934; increased on large cigars to \$11,692,859, a gain of \$59,562; and decreased on snuff to \$6,511,622, a loss of \$276,528 compared with 1934. Most of the total tobacco receipts were collected in North Carolina, Virginia, Kentucky, New Jersey, California, Ohio, and Pennsylvania, in the order named. In the fiscal year 1935 the tobacco processing tax amounted to \$32,161,943, and together with other tobacco adjustment taxes totaled \$32,725,501. The tobacco sales tax amounted to \$3,231,375. The Commissioner of Internal Revenue reported that in the calendar year 1934, there were manufactured 129,976,333,580 cigarettes weighing less than 3 lb. per 1000, compared with 114,874,217,470 in 1933. Estimates placed the 1935 output at about 133,000,000,000 cigarettes. Exports of leaf tobacco fell from 440,866,494 lb. in 1934 to 396,330,308 in 1935.

Consult also *Tobacco Markets and Conditions Abroad* (weekly, ed. by B. D. Hill, U.S. Department of Commerce); *Agricultural Outlook for 1936*.

TOBAGO. See TRINIDAD.

TOGO, FRENCH. The part of the former German protectorate mandated to France by the League of Nations. Area, 21,893 sq. miles; population (1933), 753,812 including 512 Europeans. Lomé, the capital, had 10,900 inhabitants in 1933. Palm kernels, cacao, copra, ginned cotton, and dried fish were the main products for export. In 1933, imports were valued at 41,605,232 francs; exports, 27,353,970 francs (franc averaged \$0.0501 for 1933). The local budget for 1933 was balanced at 34,127,500 francs. Government was administered by a commissioner aided by an economic and financial council.

TOGOLAND. The part of the former German protectorate of Togo, confirmed as a British mandate by the League of Nations, and attached to the British Gold Coast colony for administrative purposes. Area, 13,041 sq. miles; population (1934), 328,034. See GOLD COAST.

TOLEDO, UNIVERSITY OF THE CITY OF. A municipal, coeducational institution of higher learning in Toledo, Ohio, founded in 1872. The enrollment for the autumn of 1935 totaled 2409, of whom 1560 were men and 849 women. The faculty had 78 full-time members. The 1935 summer session enrollment was 435. The value of grounds, buildings, and equipment was \$3,500,000, and the income for 1934-35 (exclusive of gifts) was \$319,460. Gifts to the value of \$6690 were received. The library contained 35,973 volumes. President, Philip Curtis Nash, M.C.E.

TONGA (FRIENDLY) ISLANDS. A kingdom under British protection in the South Pacific, comprising three main groups of islands (Tongatabu, Haapai, Vavau) and the outlying islands of Niuafoou, Niuatobutabu, and Tafahi. Total area,

385 sq. miles; population (April, 1934 census), 30,482. During 1934 there were 1191 births, 430 deaths, and 188 marriages. Capital, Nukualofa. Copra was the main product. Bananas, citrus fruits, and native vegetables were other products. In 1934, imports were valued at £48,526; exports, £77,842. For the fiscal year ended June 30, 1934, revenue amounted to £54,743; expenditure, £64,620. Queen, Salote (Apr. 12, 1918).

TONGKING. See FRENCH INDO-CHINA.

TORONTO, UNIVERSITY OF. An institution of higher education in Toronto, Ont., Canada, founded in 1827 and supported by the provincial government. The 1935 autumn enrollment was 7253. The faculty numbered 996 members. The total expenditures for the year 1934-35 for salaries and maintenance was \$2,607,797. The library contained 316,704 volumes and 118,599 pamphlets. President, Henry John Cody, M.A., D.D., LL.D.

TOWNSEND PLAN. See OLD AGE PENSIONS.

TRADE UNIONS. Since the American Federation of Labor is treated *in extenso* in another place, it will be sufficient to mention here that according to the Report of the Executive Council to the fifty-fifth annual convention at Atlantic City, New Jersey, Oct. 7, 1935, the average membership for the fiscal year 1935 was 3,045,347. This represents an increase of approximately 650,000 members over the low point reached in 1933 and falls considerably short of the peak achieved in the year 1920 when the membership topped the 4,000,000 figure.

Two significant studies came to hand during the year which give some indication of the general drift in the United States with regard to trade union membership. The first was an analysis of employee elections conducted by the National Labor Relations Board (*Monthly Labor Review*, May, 1935). According to this article: "Employees eligible to vote in these elections numbered 45,397 and 36,433 cast a vote. Of the 35,024 votes which were valid, 20,682 (59 per cent) were for trade unions and 12,037 (34.0 per cent) were for company unions or employee-representation plans. There were 2135 (6.1 per cent) 'other' votes, that is, votes not designating any representation." This may be interpreted to mean that, after eliminating workers too indifferent even to vote—about one-fifth of all—but three-fifths of those remaining declared in favor of trade unions. Even more surprising is the fact that, to quote the analysis further: "In comparison with the results of elections conducted by the National Labor Board, these figures show a decline in the percentage of votes for trade unions. In the National Labor Board elections trade unions won 69.4 per cent of the valid votes, company unions 28.5 per cent, and no representation was chosen in 2.1 per cent." In the light of the fact that there is as yet no abatement of the wave of labor unrest characteristic since 1933 (see STRIKES AND LOCKOUTS), this decline of interest in union membership is an enigma on which no light is cast in the report. It is stated, however, that the A.F. of L. unions are still dominant in the factories polled in so far as a declaration for union representation resulted.

The second study had specifically to do with company unions, and it should be viewed in the light of the figures cited above. It was discovered that of 593 company unions with a total membership of 530,388, but 10 were, judged by minimum criteria for establishing independence from employer domination, free of paternalistic control. It is very

significant that 64 per cent of these unions were established during the period of NRA.

Great Britain. In Great Britain collective bargaining machinery has been in the making since the 1870's. The Ministry of Labor has recently begun the publication of a series of volumes reporting and analyzing the types of agreements in force in the various industries, the first of the series covering mining and quarrying, building and woodworking, and allied industries, and engineering, shipbuilding, iron and steel, and other metal industries. Since these industries normally employ about four and a half million workers, one-third of the working population eligible for unemployment insurance benefits, and since both employers and employees are highly organized, the findings with regard to them have great significance. It is, therefore, of the first interest that the recognized prerequisites to a successful collective agreement are nation-wide and industry-wide effective employer and employee organizations. Without these two factors in the picture, it is conceded that nothing important can be done. While there may be more than one organization on both sides, this does not preclude success, provided they are able to act jointly. In the ship-building and repairing industry, for example, there are 24 trade unions that have found it possible to act in collaboration amicably. A frequent provision of these agreements is that machinery shall be set up to care for disputes which threaten the stoppage of work during the life of the agreement. Usually such machinery reaches down to the workmen directly concerned and involves preliminary discussion with the managerial personnel; but if no satisfactory arrangement can be made, the dispute is carried by orderly steps to the attention of the union officials and the officials of the employer's association in the locality. It can be handed on from this point to higher officials on either side, and the assumption is that somewhere along the line an agreement will be arrived at which will avoid a strike. Various ingenious methods of handling the wage question, especially in industries using the piece-work system, were found, including the provision that wages shall be adjusted downward as the cost of living declines, but shall not descend below a fixed point. The outstanding point about the report is that the entire machinery, which has been in the process of evolution for upwards of 65 years, is predicated upon the existence of strong trade unions.

Germany. In Germany trade unions were destroyed shortly after the National Socialist government assumed power. As a substitution for them the so-called Labor Front has been developed and its status and purposes were defined in a decree issued on Oct. 24, 1934. From this document it appears that the announced purpose of the Labor Front is to insure industrial peace and further the just interests of both employers and employees, and also to effect adjustments when they conflict. The decree states that, "The aim of the German Labor Front is to form a real national and working community of all Germans. . . . The German Labor Front is an organ of the National Socialist Party . . . is an organization of German brain and hand workers. In it are mainly the members of the former labor unions, the former unions of salaried employers, and the former associations of employers, etc., who are united as members possessing equal rights. . . . The property of the former organizations . . . including their auxiliary and substitute organizations, managements of property, and economic enterprises, forms the property of

the German Labor Front." This would seem to define the Labor Front as a company union on a national scale, and it is obviously in line with the Fascist theory of compulsory class-collaboration in the national interest.

On Feb. 26, 1935, the status of labor in Germany was further defined by an administrative order requiring all workers, as a condition of employment, to be in possession of a "labor book" in which such data as personal description of the holder, date and place of birth, citizenship, family relations, residence, description of training and where obtained, alternative occupations, past experience, special abilities such as ability to drive a motorized vehicle, must be recorded, properly attested by signatures, and in the possession of the worker when he applies for a job. In this fashion the National Socialist Government expects to be able to compile statistics on the labor force of Germany more comprehensive than any now in existence, to derive material which will allow it to distribute the labor force more equitably, and give it the figures on which to base a training programme for new workers coming of age each year.

TRANSCAUCASIAN SOVIET FEDERATED SOCIALIST REPUBLIC. One of the seven constituent republics of the Union of Soviet Socialist Republics. It comprises the Armenian S.S.R. (q.v.); the Azerbaijan S.S.R.; and the Georgian S.S.R. (q.v.). Total area, 71,255 sq. miles; total population (Jan. 1, 1933), 7,110,000. Capital, Tiflis.

TRANS-JORDAN. An Arab territory in Asia Minor forming a part of the British Mandate of Palestine but governed by an independent Arab administration under Emir Abdullah Ibn Hussein. Area, uncertain; population approximately 300,000 of whom 260,000 are Arab Moslems. Amman is the capital. Budget estimates (1935-36): revenue, £P370,321; expenditure, £P373,761. There is a legislative council of 6 official and 16 elected members. High Commissioner in 1935, Lieut.-Gen. Sir A. G. Wauchope, who is also High Commissioner for Palestine. See ARABIA under *History*.

TRANSVAAL. See SOUTH AFRICA, UNION OF.

TREATIES. See INTERNATIONAL LAW.

TRENGGANU. See UNFEDERATED MALAY STATES.

TRIBOROUGH BRIDGE. See BRIDGES.

TRINIDAD. A British colony near the coast of Venezuela, comprising the islands of Trinidad (1862 sq. m.) and Tobago (114 sq. m.). Total population (1934 estimate), 425,572 compared with 412,783 (1931 census). Chief towns: Port of Spain (capital), 72,518 inhabitants; San Fernando, 14,287. In 1934 there were 12,743 births, 7970 deaths, and 1918 marriages. The 297 primary, intermediate, and secondary schools had 74,999 pupils enrolled during 1934; the four training colleges for teachers had 100 students.

Production and Trade. Petroleum, asphalt, cacao, citrus fruits, sugar, coconuts, and coffee were the main products. The grapefruit crop for 1934-35 was estimated at 45,000 cases. During 1934 the output of crude oil amounted to 10,894,363 barrels (of 35 imperial gall.); asphalt, 92,829 tons; sugar, 105,342 tons. In 1934, exclusive of transshipments and specie, imports were valued at £4,404,580; exports (including reexports of £638,242), £5,271,115 of which petroleum accounted for £2,934,174; asphalt, £166,052; sugar, £916,232; cocoa,

£499,656. The government-owned railway (123 miles long) carried 1,188,555 passengers and 370,251 tons of freight during 1934.

Government. For 1934, revenue totaled £1,710,468; expenditure, £1,706,302; public debt, £4,242,993 against which the sinking funds amounted to £1,320,975. Budget estimates for 1936: revenue, \$9,040,000; expenditure, \$9,016,000. The colony is administered by a governor aided by an executive council of 7 members, and a legislative council of 26 members. Governor in 1935, Sir A. C. Hollis.

History. On Jan. 25, 1935, work was started on the \$4,750,000 government plan for the development of the harbor at Port of Spain into a deep-water port. During August, 1935, minor public works schemes were approved in order to relieve unemployment. The legislature approved, Nov. 16, 1935, an annual expenditure of \$360,000 for the following eight years as a subsidy for the depressed cocoa industry.

TRINITY COLLEGE. An institution for the higher education of men in Hartford, Conn., founded in 1823 as Washington College and changed to Trinity College in 1845. For the autumn term of 1935 the enrollment was 489. There were 50 members on the faculty. The endowment fund of the college was \$3,100,000, and the income totaled \$305,000. The library contained 115,000 volumes and 50,000 pamphlets. President, Remsen B. Ogilby, Litt.D., LL.D.

TRIPOLITANIA. See LIBYA.

TROY. See ARCHÆOLOGY.

TRUCIAL OMAN. See OMAN, TRUCIAL, under ARABIA.

TSANA, LAKE. See EGYPT and ETHIOPIA, under *History*.

TUAMOTU ISLANDS. See OCEANIA, FRENCH ESTABLISHMENTS IN.

TUFTS COLLEGE. A nonsectarian institution for the higher education of men and women in Medford, Mass., founded in 1852. The registration for the autumn term of 1934 was 2045. There were 568 faculty members. The productive funds of the college amounted to \$7,291,900, and the income for the year was \$107,222. The library contained 113,000 volumes. President, John Albert Cousens, LL.D.

TULANE UNIVERSITY OF LOUISIANA, THE. An institution of higher education in New Orleans, founded in 1834. The total enrollment for the autumn of 1935 was 3151, of whom 639 were in the H. Sophie Newcomb College for Women. There were 987 students enrolled in the 1935 summer session. The faculty numbered 416. The productive funds for the fiscal year ending Aug. 31, 1935, amounted to \$10,421,985; the income for the year was \$1,049,010. Gifts and bequests to the value of \$393,317 were received. In the library there were 180,714 volumes. President, Albert Bledsoe Dinwiddie, Ph.D., LL.D.

TUNISIA. A French protectorate in North Africa. Capital, Tunis. With an area of 48,313 miles, Tunisia had an estimated population in December, 1933, of 2,500,000 (2,410,692 at the 1931 census). Moslems comprised 90 per cent of the population. The chief cities, with their 1931 populations, are: Tunis, 202,405; Sfax, 39,969; Sousse, 25,324; Bizerta, 23,206. The school attendance in 1932 was 84,035.

Production. Agriculture and stock raising are the principal occupations; mining and fishing also are important. The area under cultivation in 1932 was 7,250,000 acres. In the same year livestock included 453,000 cattle, 2,931,000 sheep, 1,668,000

goats, 24,000 swine, 103,000 horses, 237,000 mules and asses, and 169,000 camels. Wool production was 11,023,000 lb. in 1934. The 1934 crop yields were (in thousands of units): Wheat, 13,779 bu.; barley, 6890 bu.; oats, 1378 bu.; wine, 44,909 gal.; olive oil, 15,942 gal. The output of phosphates in 1934 was 1,765,500 metric tons; iron ore, 546,500 metric tons; lead ore, 6398 metric tons. Wool spinning and weaving, leather working, and the manufacture of carpets, pottery, matting, etc., are native industries.

Foreign Trade, etc. Merchandise imports in 1934 were valued at 1,340,400,000 francs (1,829,880,000 in 1933) and merchandise exports at 705,960,000 francs (745,080,000 in 1933). Olive oil, phosphate rock, wheat, and wine were the principal 1933 exports, in order of value. Cotton piece goods, metal manufactures, refined sugar, machinery, barrels, and vats, automobiles, wheat, and chemicals were the leading imports. France in 1933 supplied 68.9 per cent of all imports and purchased 54.4 per cent of all the exports.

Budget estimates for the year ended Mar. 31, 1935, placed revenue at 574,952,990 francs and expenditure at 574,798,138 francs. The public debt on Dec. 31, 1931, was 526,134,000 francs. In 1933 there were 1282 miles of railway line, about 3525 miles of good roads, and 21 ports, of which Sfax was the most important. The net tonnage of vessels entering the ports with cargo in the overseas trade during 1933 was 4,618,000 (4,480,000 in 1932).

Government. Tunisia is a regency under the control of the French Foreign Office, which acts through a Resident-General, who is also Minister of Foreign Affairs for Tunisia. There is a ministry of 11 departments (8 French and 3 Tunisian). The occupant of the throne in 1935 was Sidi Ahmed Bey; French Resident-General, M. Peyrion (appointed July 23, 1933).

TUNNELS. As the year came to a close, the longest tunnel in the greatest tunneling operation the world has ever known was "holed through." The headings on the 18-mile East Coachella Tunnel on the Los Angeles-Colorado River Aqueduct met on Jan. 2, 1936. This remarkable tunneling work has been noted in previous YEAR BOOKS and current progress is commented on under AQUEDUCTS.

In New York City, the 20-mile new deep distributing tunnel, which completes a distributing loop some 700 ft. below the streets of the city was officially approved and was ready for service.

Perhaps the most remarkable single work of the year was the vehicular tunnel which forms an important link in the greatest bridge building operation of the ages—the San Francisco-Oakland or Bay Bridge.

East River Vehicular Tunnel, New York. As the year came to a close, the construction of twin vehicular tubes under the East River at 38th Street, New York was practically assured by a PWA allotment of \$58,365,000. These tubes will connect Manhattan and Queens on the continuation of the new Hudson River vehicular tunnel now being rapidly completed by the Port of New York Authority, and it is hoped that it will be completed in time to provide a direct route from New Jersey to the proposed site of the 1939 World's Fair at Flushing, Long Island.

Mid-Town Tunnel, New York. Very satisfactory progress was made during the year on this, at present, single tube vehicular tunnel under the Hudson River at 38th Street, New York. The New Jersey land section of this work presents un-

usual difficulties due to the fact that the tunnel comes out at the base of the lower Palisades. Inclined ramp approaches require extensive excavation. Bids submitted in this work in November were rejected and the contract was advertised for a new letting in the hope of securing more favorable prices.

Pasadena Tunnel. A high-speed of over 2000 ft. per month was maintained in driving this 13 ft. diameter tunnel which will form part of the distributing system for the water supply to be furnished by the Metropolitan Water District of Southern California. The tunnel is 12,000 ft. long and runs through damp sand and gravel at depths of 30 to 80 ft. Horseshoe shaped steel beam supports are used with wood lagging.

Yerba Buena. This tunnel through Yerba Buena Island, which connects the two great sections of the Bay Bridge at San Francisco, is of record size. It is the greatest section in America and only misses by a few feet being the largest in the world. The famous Rove canal, tunnel at Marseilles, France, has a finished span of 72.2 ft. against a 65.5 ft. clear span at Yerba Buena. The former work, however, required a maximum width of excavation of approximately 80 ft, which, because of the thicker lining used, is but one foot greater than that of the Yerba Buena bore.

The construction of this tunnel was particularly interesting because the lining was completely placed before the greater part of the core excavation was removed. The space for the side walls was first cut, these walls were then lined, the arch was cut, timbered against the central core, and then lined. Finally, the central core was excavated completing the section. Sixteen inch curved steel beams, used to support the roof, were embedded in the final concrete roof lining, which varied in thickness from 3 to 6½ feet.

TURBINES. See STEAM TURBINES

TURKEY. A republic comprising parts of Asia Minor and the Balkan peninsula as well as Imbros, Tenedos, and the Rabbit Islands in the Aegean Sea. Capital, Ankara (Angora).

Area and Population. Turkey has an estimated area of 294,492 square miles (285,258 in Asia and 9257 in Europe). Preliminary returns of the census of Oct. 20, 1935, placed the population at 16,188,767 (13,648,270 at the 1927 census). The 1935 population comprised 7,974,925 males and 8,213,842 females. The 1935 populations of the chief cities, with 1927 census figures in parentheses, were: Istanbul (Constantinople), 740,751 (690,857); Izmir (Smyrna), 170,410 (153,924); Ankara (Angora), 125,414 (74,553); Bursa (Brusa), 72,326 (61,690); and Konya (Konia), 52,594 (47,496). Adana in 1927 had 72,577 inhabitants. The population is overwhelmingly Moslem in religion.

Education. The Ministry of Education reported that 45 per cent of the population was able to read and write in 1934. The school enrollment in 1933 was: Primary, 567,963; secondary, 43,511; higher education, 5497. The principal university is at Istanbul (5398 students in 1933). The Turkish alphabet with Latin characters replaced Arabic throughout Turkey by government decree in 1930.

Production. More than 80 per cent of the working population is engaged in agriculture. In 1930 there were 14,217,000 acres of arable land and 21,783,000 acres of woods and forests. The crop yields in 1934 were (in thousands of units): Wheat, 88,546 bu.; barley, 86,311 bu.; corn, 12,692 bu.; oats, 9954 bu.; tobacco, 88,185 lb.; olive oil (Aegean re-

gion, 1934-35), 8625 gal.; raisins (Ægean region), 88,180 lb.; figs (Ægean region), 57,320 lb.; cotton (lint, 1934-35), 36,806 lb.; opium, 551 lb. Livestock in 1934 included 5,169,000 cattle, 10,719,000 sheep, 1,564,000 horses, mules, and asses, 539,000 buffaloes, and 8,998,000 goats. Production of coal was 2,288,000 metric tons in 1934; of lead, 2800 metric tons in 1933; of silver, 4800 kilograms in 1931. Emery, copper, zinc, chrome, boracite, argile, meerschaut, mercury, gold, manganese, and antimony are produced on a small scale. Manufacturing is increasing under government sponsorship. The most important industrial enterprises in 1935 were flour mills, sugar refineries, cement plants, olive-oil presses and refineries, soap factories, canning plants, leather tanneries, and textile mills.

Foreign Trade. General imports in 1934 were valued at 86,800,000 Turkish pounds (£T74,700,000 in 1933) and general exports at £T92,100,000 (£T96,100,000 in 1933). Cotton fabrics, iron and steel, machinery, coal and mineral oils, cotton yarn, and coffee, tea, and cacao are the leading imports and leaf tobacco, raisins, eggs, shelled filberts, live animals, figs, and barley are the chief exports. Germany in 1932 supplied 23.2 per cent of the imports; Italy, 12.9; United Kingdom, 12.4; France, 8.4; United States, 2.6, while Italy took 16.1 per cent of the exports; Germany, 13.5 per cent; United States, 11.9; United Kingdom, 9.8; and France, 7.7.

Finance. The budget for 1935-36 (June 1-May 31) estimated receipts at £T195,013,000 and expenditures at £T195,011,053, as compared with £T184,081,000 and £T184,075,636, respectively, for 1934-35. The 1935-36 national defense budget was £T69,799,232, or 35.6 per cent of the total expenditures. Closed accounts for 1933-34 showed receipts of £T198,300,000 and expenditures of £T201,000,000. The public debt on May 31, 1934, totaled £T433,600,000 (domestic, 214,800,000; foreign, 218,800,000), compared with £T442,200,000 on May 31, 1933. The Turkish pound (par value \$7.44 in 1935) exchanged at an average of \$0.4729 in 1932, \$0.4726 in 1933, and \$0.4726 in 1934.

Communications. Turkey at the beginning of 1935 had 3770 miles of state-owned railway lines and the mileage was extended further by the completion in November, 1935, of two important lines—the Irmak-Filios and Fevzipasha-Diarbekr lines. The Irmak-Filios line, 245 miles long, took eight years to build and cost \$40,000,000. It connects the Soguldak coal fields on the Black Sea coast with the newly developed industrial region of central Anatolia. The other new line is 315 miles long and cost \$60,000,000. It will permit the development of a region rich in minerals and other resources. The Turkish merchant marine on June 30, 1935, comprised 182 vessels of 199,284 gross tons. Air lines connect Istanbul with Ankara and with many European cities. Highways extended about 9870 miles, excluding unsurveyed tracks.

Government. The Constitution of 1921, as amended Apr. 20, 1924, vested executive and legislative power in the Grand National Assembly as the sole representative of the people. The Assembly exercised executive power through the President, who is elected by the Assembly, and through a Council of Ministers chosen by the President. Terms of office of both President and Assembly members are for four years. In practice, Turkey was a dictatorship under Kemal Atatürk, who was elected first President on Oct. 29, 1923, and was reelected in 1927, 1931, and 1935. For the 1935 elections, see *History*.

HISTORY

Domestic Affairs. The process of forging a united nation along western lines continued at top speed in Turkey during 1935 under the strong hand of Mustafa Kemal Atatürk. The dictator was reelected to the Presidency for another four-year term at the reopening of the Grand National Assembly on March 1, thus insuring the continuance of his work, which in a period of 15 years had infused new life into the Turkish nation.

The continued process of modernization was reflected by developments in many different fields. An outstanding event in the political sphere was the participation of women in the national elections for the first time on February 8, when 17 women were elected Deputies to the Grand National Assembly. Due to the reapportionment of seats on the basis of one Deputy to every 40,000 inhabitants, the new National Assembly contained 399 Deputies, or 82 more than the preceding one. All of the Deputies except 15 independents were members of Kemal Atatürk's People's party, the only political organization permitted.

Fear that the Union of Turkish Women might develop into a political party, now that women had the vote, led the government to order its dissolution late in April. In the belief that Masonic principles were incompatible with its nationalistic policy, the government on October 12 ordered the suppression of all Masonic lodges. Other moves of the same general character were the establishment of a board of censors over moving pictures; the banning of the public wearing of clerical garbs, effective June 13; the extension of Turkish citizenship to some 2000 denationalized White Russians; the substitution of Sunday as the weekly day of rest in place of Friday, the traditional Moslem Sabbath; the opening of the mosque of Santa Sophia at Istanbul as a museum of Byzantine art on February 1; and the completion of the first stage of the preparation of a new simplified Turkish language.

Progress in the economic field was no less marked. The five-year industrialization programme was carried forward under the direction of the Sumer Bank. A cotton textile factory at Kayseri, equipped with Russian machinery, started operations on July 1. Contracts were awarded for two additional cotton textiles mills and new silk and rayon factories were opened in the autumn. The country's first glass factory started operations and production in the first paper mill was scheduled to begin in January, 1936. Plans were completed for the establishment of a small iron and steel industry at Zonguldak.

On June 14, the government created the Eti Bank, with a capital of £T20,000,000, for the purpose of establishing and developing electrification and new mining projects. The bank was given broad powers to acquire, sell, and regulate properties, issue bonds, guarantee loans, and intervene in the purchase and sale of such properties. The British-owned Izmir-Aidin Railway was purchased by the Ankara Government on May 1 for approximately \$8,500,000. Effective July 21, the government also acquired the Constantinople Telephone Co., the purchase price being £800,000 sterling. In preparation for the reform of the fiscal system, three French experts were engaged to investigate phases of Turkish finance and submit recommendations.

Alarmed by the warlike tendencies in Europe, the government placed great emphasis upon strengthening the national defenses. The budget

adopted in March, 1935, increased the total defense appropriations by £110,000,000 to a total of £166,947,062. On May 18 the cabinet decreed compulsory pre-military training for children of both sexes. On May 25 Premier Ismet Inonu declared the air force must be increased to 500 planes, at a cost of \$24,000,000 annually. In June the Premier appealed for public subscriptions to carry the new air programme into effect, and a liberal response was reported. Despite this, an additional air appropriation of about \$17,500,000 was authorized by a bill adopted by the National Assembly on December 25.

One of the sporadic conspiracies among fanatical Moslems outraged by the government religious policies was reported in Southern Asia Minor on May 5, headed by the Kurdish sheikh Uzzeman Saidi. It was quickly suppressed and 30 conspirators were arrested. The police announced on October 17 that they had frustrated a plot against the life of Mustafa Kemal Pasha by arresting six Circassians and a member of the Grand National Assembly.

Foreign Relations. The expansion of Turkish armaments at great cost during 1935 was due largely to the threatening attitude of Italy, particularly in the Dodecanese Islands situated only 12 miles off the Turkish coast. Italy had long cast covetous eyes upon southern Anatolia as a field for expansion and the Turks feared that Mussolini was preparing for such an adventure, using the Dodecanese Islands as a base of operations. They were therefore relieved when Mussolini finally selected Ethiopia as his victim, but they did not slacken their defensive preparations. Italian troop movements and air activities led the Turks in November to mobilize part of their civilian reserves in the region opposite the Dodecanese group.

Believing that Turkey's future immunity from an Italian attack could be insured only through the development of the principle of collective security embodied in the League Covenant and the Balkan Pact, the Ankara Government fully supported the League in the application of economic and financial sanctions against Italy. The policy was widely approved in Turkey although Italy normally purchased about 20 per cent of all Turkey's exports. With the development of the Anglo-Italian crisis in September and October, Turkey was reported to have offered the British military and naval support, including the right to use Turkish harbors, in the event of war with Italy. In return the Turks asked a British pledge that the Italian Dodecanese Islands near the Turkish shore should be transferred to Turkey and that the others should be given to some other power. In December Turkey and the other members of the Balkan Entente (q.v.) formally agreed to go to Britain's aid in case of an Italian attack upon her arising from the application of League sanctions.

That Turkey took her pledges under the Balkan Pact seriously was shown during the Greek revolt in March. Bulgarian troop concentrations near the Greek frontier led Turkey to mobilize troops along the Turkish-Bulgarian border as a warning against Bulgarian intervention in Greek affairs. See *BULGARIA* and *GREECE* under *History*.

Turkey meanwhile continued to press Britain and the other signatories of the Lausanne Treaty of 1923 for the right to fortify the demilitarized zones along the Straits and the Turkish western frontiers. It was reported from London on December 23 that France had agreed to support the Turkish demand regarding the Straits. Turkey also continued actively to strengthen its under-

standings with the Soviet Union and with the neighboring Asiatic States. Three treaties of friendship and neutrality with the Soviet Union were renewed on November 7 at Ankara. It was reported that a pact of friendship and non-aggression had been concluded earlier in the year by Turkey, Iran, and Iraq, and that Turkey, Iran, and the Soviet Union had formed an entente cordiale that envisaged concerted action in case of a European crisis.

TURKMAN S.S.R. See *SOVIET CENTRAL ASIA*.
TURKS AND CAICOS ISLANDS. See under *JAMAICA*.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. An institution for the vocational training of colored young men and women at Tuskegee Institute, Ala., founded in 1881 by Booker T. Washington. The enrollment for the term beginning September, 1935, was 1519. There were 210 members on the faculty. The endowment for the year ending May 31, 1935, was \$7,027,156; the income was \$387,484. The library contained 45,000 volumes. President, Fred D. Patterson, D.V.M., M.S., Ph.D.

TUTUILA. See *SAMOA*.

TWENTIETH CENTURY FUND. See *LABOR*; *UNIVERSITIES AND COLLEGES*.

UBANGI-SHARI. See *FRENCH EQUATORIAL AFRICA*.

UGANDA, ō-gan'dā or u-gan'da, **PROTECTORATE.** A British protectorate in East Africa. Area, 94,204 sq. miles; population (1931 census), 3,536,267 natives, 14,150 Asiatics, 2001 Europeans, and 1116 others. Chief towns: Entebbe (capital); Kampala, and Jinja.

Production and Trade. Cotton with an estimated output of 240,000 bales (of 400 lb.) for 1934-35, as compared with 285,642 bales for 1933-34, was the chief product. Coffee (7715 tons exported during 1934), sugar, groundnuts, simsim (seeds and oil), tobacco, rubber, tea, tin ore, gold, salt, hides, and skins were other products. Uganda and Kenya were a single unit for customs purposes and complete freedom of trade existed between them. In 1934, imports (ex-ship Mombasa) were valued at £1,751,051; domestic exports (f.o.b. value Mombasa), £3,773,766 of which cotton (lint and seed) accounted for £3,013,743; coffee, £293,313; sugar, £240,593.

Government. For 1934, revenue amounted to £1,527,672; expenditure, £1,330,561; public debt, £2,235,600. Budget estimates for 1935: revenue, £1,170,643; expenditure, £1,169,918. The functions of government were administered by a governor aided by an executive council and a legislative council. Native kings and chiefs, including some with rights regulated by treaty, were encouraged in carrying out the government of their own subjects. During November, 1935, Philip E. Mitchell succeeded Sir B. H. Bourdillon as Governor and Commander-in-Chief. See *KENYA* under *History*.

UKRAINIANS. See *POLAND* under *History*.

UKRAINIAN S.S.R. One of the seven constituent republics of the Union of Soviet Socialist Republics (q.v.). Area, including the Moldavian Autonomous S.S.R., 174,395 sq. miles; population (Jan. 1, 1933), 32,069,700 of whom 80 per cent were Ukrainians, 9.2 per cent Russians, and 5.2 per cent Jews. Chief towns: Kiev, the capital, 607,764 inhabitants; Kharkov, 742,000; Odessa, 442,980; Dnepropetrovsk, 378,000.

Production. The Ukraine was the most important grain producing area in the Soviet Union. In 1933 the area under cultivation amounted to 26,373,000 hectares (hectare = 2.47 acres). By 1934, 73.2 per cent of the peasant holdings had been collectivized. Coal, manganese ore, iron ore, steel, sugar, agricultural machinery, were important products. In 1933, industrial production was valued at 5,100,000,000 rubles (ruble was worth \$0.5146 in the U.S.S.R. during 1933), and 1,400,000 workers were employed.

UNEMPLOYED YOUTH. See CHILD WELFARE.

UNEMPLOYMENT. The Social Security Act, signed by President Roosevelt on Aug. 14, 1935, included provisions establishing unemployment insurance, but hardly was the ink of the signature dry before objections to the plan were raised. The opposition was not confined to those who doubt the wisdom of any Federal measure in this field, preferring to leave the matter to the States as in the case of child labor, etc., but was also voiced by experts who favored a uniform national system. Under the present plan, it is predicted, a chaotic condition will rapidly develop and out of that chaos nothing of any great profit to the nation, the administrative officials or the unemployed, will come. The most pointed, and in many respects the most expert, criticism was that voiced by Abraham Epstein in *Harper's Magazine* for November, 1935. Mr. Epstein said, in part, that:

The unemployment insurance plan . . . disregards the advice of not only the [Committee on Economic Security] staff's chief expert on unemployment insurance and practically all students of the problem, but also that of the majority of the Advisory Council composed of such prominent employers as Messrs Swope and Teagle, labor leaders as William Green and George M. Harrison, and public leaders such as Frank P. Graham . . . Father John A. Ryan, and Helen Hall . . . Instead of providing for uniformity of standards, the Federal Act not only sets up no basic requirements for proper State Systems but goes out of its way to discourage this by inviting States to establish individual reserve funds and employment guarantee plans, thereby not only complicating the administration of the system but actually frustrating any hope of establishing an adequate system of unemployment insurance throughout the United States. Instead of national uniformity the present scheme will foster a miscellany of forty-nine divergent plans. . . .

However, the Federal authorities continued with their plans to put the prescribed scheme into operation in 1936, and the States began to respond to the suggestion that they institute plans of their own. Representatives of 39 States met in Washington on Dec. 14, 1935, to discuss all phases of the necessary cooperative action under the Act, and at that time it was announced that nine States had passed their own unemployment insurance acts, covering 33 per cent of the nation's payroll. The States referred to were New York, Wisconsin, Massachusetts, New Hampshire, California, Oregon, Washington, Alabama, and Utah. The lack of any basis for comparison among the laws passed is clearly indicated by a rapid review of the laws of these nine States, as discussed in the *Monthly Labor Review* for May (N. Y., Utah, Washington), July (New Hampshire), August (Calif.), and November (Ala., Mass.), but the differences are too intricate for analysis in a brief article of this character. The Wisconsin act, the first to be passed and the only one pre-dating the Federal Security Act, became compulsory on July 1, 1934, and began to pay benefits for unemployment originating on or after July 1, 1935. It is estimated that 3400 firms employing 300,000 workers are subject

to its provisions. About two-thirds of the employers subject have established exempt benefit plans, which are under State supervision, and since the act provides that the employers finance both it and an expanded scheme of public employment agencies, it is expected that the entire machinery will soon demonstrate its effectiveness, or lack of it. The first decisive step of the Federal authorities was taken on Dec. 20, 1935, when the Treasury authorities announced a decision as to payroll taxes as follows:

(a) Every person subject to tax under the act shall, during the calendar year 1936 or any calendar year thereafter, for each such calendar year, keep such permanent records as are necessary to establish:

(1) The total amount of remuneration payable to his employees in cash or in a medium other than cash, showing separately (a) total remuneration payable with respect to services excepted by Section 907c, (b) total remuneration payable with respect to services performed outside of the United States, (c) total remuneration payable with respect to all other services.

(2) The amount of contributions with respect to employment during the calendar year paid by him into any State unemployment fund, showing separately (a) payments made and not deducted (or deductible) from the remuneration of employees, (b) payments made and deducted (or deductible) from the remuneration of employees, (c) payments made with respect to services excepted by Section 907c.

OTHER INFORMATION REQUIRED

(3) Such other information as will enable the commissioner to determine whether such person is subject to the tax and, if subject to the tax, the amount thereof.

(b) No particular method of accounting or form of record is prescribed. Each person may adopt such records and such method of accounting as may best meet the requirements of his own business, provided that they clearly and accurately show the information required above and enable him to make a proper return on the prescribed form.

(c) Records are not required to show the number of individuals employed on any day, but must show the total amount of remuneration actually paid during each calendar month and the number of individuals employed during each calendar month or during each such lesser period as the employer may elect.

(d) Any person who employs individuals during any calendar year, but who considers that he is not an employer subject to the tax, should be prepared to establish by proper records (including, where necessary, records of the number of persons employed each day) that he is not an employer subject to the tax.

As the Act goes into operation, it is pertinent to recall certain observations made by the Committee on Social Security relative to the general scheme. In a release of Nov. 1, 1934, the Committee stated:

Unemployment insurance will not solve the problem of the business cycle. . . . It cannot prevent the depression, . . . will not directly benefit any group in society other than the wage-earners and salaried employees. This excludes the 20 per cent of our gainful workers who are farmers, merchants, professional men, and self-employed persons, . . . nearly all of the more than three million wage-earners employed in agriculture, forestry and fishing; the great majority of the four million five hundred thousand people who are employed in domestic and personal service; and also, the two million three hundred thousand "executive and professional" salaried employees . . . (It does not eliminate the necessity for relief or emergency employment.

Unemployment Statistics. The national figures for unemployment continue in a state of almost unmitigated chaos, and in some respects the situation was worsened in 1935. For several months on end the A.F. of L. did not issue figures at all but announced that it was revising its methods of making the estimates. Writing in the *New York Times* late in the year Henry Hazlitt correctedly stated that:

the present figures of unemployment—so often quoted with great confidence, as if the unemployed had been run through a turnstile and counted—are little better than guesswork.

Mr. Hazlitt pointed out that both of the outstanding estimates, those of the A.F. of L. and the Na-

tional Industrial Conference Board, are figured from the same base which was obtained from the Census of 1930 in which 3,188,000 persons were reported unemployed as of the month of April. Thereafter the estimates have diverged. While both sets agree that the peak of unemployment was reached in the bank-crisis month of March, 1933, the divergence began to expand after that date until in January, 1934, the Conference Board figures were 1,000,000 below the A.F. of L. totals. The fundamental trouble seems to be that large groups of workers are not adequately reported to any existing centre, including workers in agriculture, forestry, and fishing, together with professional men, self-employed persons, domestic workers, certain kinds of clerical workers, and workers in such branches of transportation as taxi-ing, trucking, etc. The opportunity for over- or under-estimation is obvious and, until a more adequate system of reporting is discovered, American figures on unemployment are of dubious validity.

A further complicating factor was injected into the picture when, on Dec. 4, 1935, Robert R. Nathan, formerly consultant on unemployment statistics to the Committee on Economic Security, and now with the Department of Labor, announced semi-official figures which differed from both the A.F. of L. and Conference Board totals. While agreeing that the peak came in March, 1933, Mr. Nathan's figure was larger than either current figure:

Unofficial figure for March, 1933	15,071,000
A F of L.	13,689,000
National Ind. Conf. Bd.	13,496,000

In early November, William Green announced that the revision in method used in calculating the A.F. of L. figures was complete and that the March, 1933, figure was now 15,470,000. For October, 1935, Mr. Green set a figure of 11,650,000 unemployed, while the Conference Board estimate was 9,196,000, bringing the divergence between these two estimates up to almost two and a half million individuals. Obviously this is chaos of the worst kind and demands that measures to establish a national reporting system of universally accepted validity be taken.

Foreign Unemployment Statistics. In most foreign countries far more valid figures are available and are used not only to gauge the state of employment but the prospective drain on unemployment reserves and the probable need for general relief. The latest available figures for the principal foreign nations which follow were abstracted from the meticulously detailed reports printed in the *Monthly Labor Review* for October, 1935:

Australia (June, 1935)	77,090
Austria (June, 1935)	238,133
Belgium (June, 1935)	250,647
France (June, 1935)	402,661
Germany (June, 1935)	1,876,579
Great Britain (June, 1935)	2,000,110
Italy (June, 1935)	638,100
Japan (March, 1935)	367,542
Poland (June, 1935)	366,949
Sweden (June, 1935)	59,572

It must be recalled, however, that even foreign figures have their deficiencies, especially in nations making "policy concealments," and certainly the comparative significance of the totals is difficult to determine.

Legislation in foreign countries dealing with un-

employment during the year included the establishment in Great Britain of a new system for the handling of unemployed insured persons who had exhausted their benefits under the insurance scheme; the establishment of a compulsory insurance scheme in Canada (passed June 28, 1935); and the establishment of labor camps in the national forests of France.

UNFEDERATED MALAY STATES. The five States (see below) of the Malay Peninsula which were under British protection but were not included in the Federated Malay States.

Johore. Area, 7500 sq. miles; population (1934), 617,340. Capital, Johore Bahru. Rubber, pineapples, copra, iron, tin, timber, areca nuts, and tapioca were the main products. In 1934, imports were valued at \$31,213,739; exports, \$51,077,703; revenue, \$16,660,594; expenditure, \$11,692,115 (Straits \$ averaged \$0.5901 for 1934; \$0.5717 for 1935).

Kedah. Area, 3648 sq. miles; population (1934), 465,270. Capital, Alor Star. Rubber, coconuts, and betel nuts were the main products. In 1934, imports were valued at \$39,333,884; exports, \$27,650,670. For 1934-35, revenue amounted to \$6,711,272; expenditure, \$5,314,856.

Kelantan, kē-lan'tan'. Area, 5713 sq. miles; population (1931 census), 369,411. Capital, Kota Bharu. Rubber, copra, betel nuts, manganese ore, gold, fish, and rice were the principal products. In 1934, imports were valued at \$5,171,181; exports (including reexports), \$5,576,086; revenue, \$2,220,769; expenditure, \$1,710,790.

Perlis. Area, 316 sq. miles; population, 49,300. Capital, Kangar. Rice and tin ore were the main products. For 1934-35, revenue amounted to \$358,382; expenditure, \$487,130.

Trengganu, trēng-ga'nō. Area, 5080 sq. miles; population (1934), 189,161. Capital, Kuala Trengganu (13,953 inhabitants in 1931). During 1934, there were 6330 births and 4590 deaths. Rice, coconuts, rubber, areca nuts, fish, iron, tin, and manganese were the main products. In 1934, imports were valued at \$3,460,829; exports, \$6,580,970; revenue, \$1,699,319; expenditure, \$1,405,157.

UNION COLLEGE. A nonsectarian college for men at Schenectady, N. Y., founded in 1795. The enrollment for the autumn of 1935 totaled 785. The faculty numbered 73. The amount of endowment for the year was \$4,113,000, and the income, \$467,683. The library contained 90,000 volumes. Hale House, containing a dining hall, and student and faculty lounges, was opened. President, Dixon Ryan Fox, Ph.D.

UNION OF SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

UNION OF SOVIET SOCIALIST REPUBLICS (U.S.S.R.). A republic comprising the greater part of the former Russian Empire. Capital, Moscow.

Area and Population. The area of the Union of Soviet Socialist Republics is 8,199,258 square miles, of which 21.6 per cent lies in Europe, 78.4 per cent in Asia. The population Jan. 1, 1934, was estimated at 168,000,000. It was 147,013,600 by the census of December, 1926, and 139,700,000 in the same territory in 1914. The census of 1926 gave 71,024,300 males and 75,989,300 females.

The Union in 1935 was composed of 7 constituent republics, which in turn included 18 autonomous republics and 16 autonomous areas. The Russian Socialist Federated Soviet Republic contained 93 per cent of the area and 69 per cent of the popula-

tion of the country. The estimated area and population of the seven constituent republics as of Jan. 1, 1933, is shown in the following table.

Republic	Sq. miles	Population
R. S. F. S. R.	7,606,902	113,991,100
White Russian S. S. R.	48,945	5,439,400
Ukrainian S. S. R.	174,395	32,069,700
Uzbek S. S. R.	66,392	4,928,400
Transcaucasian S. F. S. R.	71,641	6,888,300
Turkmen S. S. R.	171,229	1,182,200
Tajik S. S. R.	55,545	1,182,100
Total	8,195,049	165,681,200

Cities of over 250,000 by official estimate of Jan. 1, 1933: Moscow, 3,663,000; Leningrad, 2,776,400; Baku, 709,500; Kharkov, 654,300; Kiev, 538,600; Rostov-on-Don, 517,600; Odessa, 497,000; Tashkent, 491,000; Sverdlovsk, 462,000; Gorky (Nizhni-Novgorod), 459,200; Tiflis, 405,000; Stalingrad, 404,000; Dnepropetrovsk, 379,200; Saratov, 338,000; Novosibirsk, 287,000; Stalin (Yuzovo), 273,900; Perm, 269,400; Samara, 260,000; Kazan, 258,700.

Education. Public education in the Soviet Union made great strides after the revolution. Universal compulsory education covering a three-year period was put in operation in 1930, and was later extended to seven years. Adult education was the object of great attention by the authorities and thousands of schools for illiterates have taught as many as 10,000,000 adults annually. The number of children in elementary and secondary schools in 1935 was nearly 26,000,000, more than three times the number before the revolution. In addition there were 10,000,000 children in kindergartens. Expenditures for education increased from 1,493,000,000 rubles in 1929 to 11,100,000,000 rubles in 1935. As a result of this great effort illiteracy, which embraced 67 to 70 per cent of the population in 1914, was reduced to 8 per cent.

The growth of higher education was also rapid. In 1934 there were upwards of 500,000 students in colleges and nearly 1,500,000 more in technicums and workers' faculties. Education in the Soviet Union is a charge against each of the seven constituent republics and against the localities concerned.

Production, etc. In the Soviet Union transport and communications are conducted as Federal departments. Banking is centralized in a State Bank under governmental control. Distribution is socialized, with stores conducted by local administrative bodies rapidly replacing those run by the cooperatives and by individual factories. Industrial production is carried on largely by state enterprises, operating under the general direction of appropriate Commissariats or government departments. A State Planning Commission (Gosplan) plots the objectives for each year and for five-year periods. A Council of Labor and Defense acts as a coordinative and standardizing body. A Commission of Soviet Control checks and supervises results.

State planning is an essential of Soviet economy. The planning system is designed to direct and coordinate the employment of the energies and resources of the country for orderly development. The planning system, however, goes beyond the economic field. It includes science, education, public health, and the extensive social services designed to safeguard the welfare and security of the citizenship.

Under this system the work of Gosplan has assumed a position of primary importance. Its personnel in Moscow includes a considerable number

of permanent specialists reinforced by consultants who are authorities in every field. Under the central body each Constituent Republic has its Gosplan, and there are subordinate planning boards in the various cities.

The first Five-Year Plan was completed Dec. 31, 1932, in four and a half years. Under it the industrial output was increased 119 per cent, and substantial bases in heavy industry were established. In agriculture the whole set-up was recast and in 80 per cent of the agricultural area the small individual strip-farms were replaced by large-scale collective farms, in most cases with a high degree of mechanization. In addition 10 per cent of the total farm area was represented by state farms mechanized in all departments and run on industrial lines.

The second Five-Year Plan was inaugurated Jan. 1, 1933. It envisages an increase of 114 per cent in industrial production, production goods to increase by 97 per cent and consumption goods by 134 per cent.

In agriculture the sown area is to be increased by 5 per cent, but more intensive methods of cultivation are expected to increase the crops by one-third. Tractors in use will increase to 400,000 by 1937. Capital investments for the period are fixed at 130.4 billion rubles (they were 50.5 billion rubles under the first Plan). New rail lines to be built will aggregate 12,000 kilometers and inland water transport will be greatly extended.

Industry. The year 1935 showed broad advances in industry, with the planned schedules surpassed all along the line. The output of heavy industry was 107 per cent of the plan for the year, that of light industry 102 per cent, of the lumber industry 103 per cent and of the food industry 111.5 per cent. Industrial production generally increased 20.4 per cent over that of 1934. In 1934 the advance was 19 per cent.

The output of key indicators in Soviet industry for 1935, with comparative figures for 1934 and for the fiscal year 1927-28 (the year preceding the beginning of the first Five-Year Plan), follows:

SOVIET INDUSTRIAL PRODUCTION

	1935	1934	1927-28
Coal met tons	106,660,000	93,500,000	35,400,000
Oil do...	23,110,000	24,100,000	11,600,000
Pig iron do...	12,480,000	10,400,000	3,280,000
Steel ingots do...	12,420,000	9,600,000	3,370,000
Motor vehicles units..	96,059	72,459	680
Tractors do ..	111,400	90,729	1,490
Power output 1,000 kwh.	25,800,000	19,500,000	5,003,000

Agriculture. Since 1928 the structure of agriculture has been completely reorganized. The small, individual peasant holdings, averaging from 12 to 14 acres, have in large measure given way to large-scale collective farms in which the peasants pool their plots. This new set-up has made possible better organized methods of production with a high degree of mechanization. During the first years of this transition period progress was difficult, but beginning with 1933 the new methods demonstrated their worth in a series of bumper harvests.

PRINCIPAL INDUSTRIAL CROPS

	1933	1934
Cotton (unginned) met. tons	1,320,000	1,320,000
Sugar beets do...	9,000,000	11,360,000
Flax (long fibre) do...	560,000	530,000
Sunflower seeds do...	2,350,000	2,080,000
Tobacco do...	79,000	57,000

Gross grain crops (in thousands of metric tons) were: 1913, 80,100; 1930, 83,540; 1931, 69,480; 1932, 69,870; 1933, 89,802; 1934, 89,400; 1935, 90,200. Grain exports (in metric tons) were: 1909-13 (average), 10,700,000; 1931, 5,050,306; 1932, 1,763,298; 1933, 1,689,790; 1934, 771,096.

The backbone of mechanization in Soviet agriculture is furnished by the machine and tractor stations, each of which serves collective farms within its area. These stations grew from 145 in 1930 to 4128 in 1935. They operated about two-thirds of the tractors in the country. The growth of mechanization on the farms is shown in the accompanying table.

GROWTH OF MECHANIZATION ON FARMS

Year	Tractors	Combines	Year	Tractors	Combines
1913	128	1933	204,100	25,000
1929	34,900	45	1934	281,000	33,000
1931	125,300	6,400	1935	349,500	48,000

Labor. Membership in labor organizations in 1935 was 19,000,000 out of a total of 23,000,000 employed workers. In 1928 the total membership was 10,800,000. The spread of industry had created conditions of full employment since 1930. Industry was operated on the basis of a five-day week with a uniform rest day on the sixth day. The seven-hour workday was generally established. An elaborate system of social insurance provided allowances for sickness, disability, old age, and death, and furnished medical care and hospitalization as needed. Annual vacations with pay of at least a fortnight for all workers were compulsory.

Electrification. Up to the time of the revolution Russia was one of the most backward countries in power development. In 1935 the country was linked together by a series of over 50 large-scale regional power plants, reinforced by a steadily growing number of local plants. The largest of the enterprises was the Dnieproges station with an ultimate capacity of 558,000 kw. The total plant capacity rose from 1,874,000 kw in 1928 to 6,143,000 kw in 1934. Output rose from 5 billion kw-hr in 1928 to 20.5 billion kw-hr in 1934 and reached 25.8 billion kw-hr in 1935. The schedule of the second Five-Year Plan called for an output of 38 billion kw-hr in 1937, about 20 times the power provided in 1913.

Transportation. Great gains in transportation, in the development of rail, water, and air lines, were in progress in 1935. The new rail projects included a new northern Trans-Siberian line to run from the Baltic Sea to the mouth of the Amur River. During the preceding few years double-tracking of the old Trans-Siberian Railway had been virtually completed. A section from Chita, near Lake Baikal, to Khabarovsk (1365 miles) was finished in 1935. During the second Five-Year Plan 18,700,000,000 rubles were to be expended on railroad development and 7000 miles of new lines were scheduled to be placed in operation.

Railway mileage in 1934 was 51,700, about 45 per cent greater than in 1913. The rapid industrialization put a great strain on existing facilities and of recent years the railroads have been a bottleneck problem in the economic picture. The new Railway Commissar, L. M. Kaganovich, appointed early in 1935, brought about a marked improvement. Under his energetic administration daily freight car loadings increased from 55,282 in the first quarter to 75,241 in December. Freight operations in 1934 were 202 million ton-kilometers. Length of Soviet air lines in 1934 was 29,200 miles. The lines carried 65,000 passengers and 7200 metric

tons of mail and freight. Tsarist Russia had only 15,000 miles of roads, of which about one-fifth was paved. In 1934 there were 879,957 miles of roadway, of which 154,000 miles represented main highways and the remainder local roads.

Potential length of inland waterways in the Soviet Union is over 350,000 kilometers, of which 85,000 kilometers were navigable in 1935. The navigable chain was to be expanded to 101,000 kilometers by the end of 1937. The new extensions include a canal connecting Moscow with the upper reaches of the Volga. Another link would connect with the Baltic Sea, making Moscow a seaport for moderate sized vessels. Preliminary work was begun on a canal linking the Volga and the Don rivers—giving the Volga an outlet on the Black Sea—and on an extensive river-canal chain providing a continuous waterway between the Southern Urals and the Kuznets coal basin in West Siberia. During the first Five-Year Plan a waterway connecting the Baltic and White Seas was completed and the Dnieper River was made navigable to its upper reaches by a canal around the rapids at the Dnieproges dam. Freight carried in inland waterways in 1935 was 72,600,000 metric tons, compared with 39,900,000 metric tons in 1928.

Shipping. The Soviet merchant fleet was increased from 327,000 tons in 1928 to 1,350,000 tons in 1935. Further substantial increases were planned for 1936, both in new ships built in domestic yards and in ships purchased abroad.

Commerce. Soviet foreign trade, which held up well during the first two years of the world depression, showed a marked decline beginning late in 1931, though the decline was substantially checked in the late months of 1935. Figures for recent years are shown in the accompanying table in gold rubles (par value of gold ruble was \$0.8713 during 1935).

SOVIET FOREIGN TRADE
[Gold rubles]

Year	Exports	Imports	Total
1928	799,800,000	945,500,000	1,723,300,000
1931	811,200,000	1,105,000,000	1,916,200,000
1932	563,900,000	698,700,000	1,262,600,000
1933	495,700,000	348,200,000	843,900,000
1934	418,300,000	232,400,000	650,700,000
1935	367,400,000	241,400,000	608,800,000

Exports of gold are not included in Soviet customs figures. Gold production has been greatly increased during the past few years. While no official figures were available, the output in 1935 was estimated at \$170,000,000 to \$200,000,000 and exports were considerable. The principal Soviet exports in 1934 were: Lumber, 89,297,000 rubles; oil products, 59,611,000 rubles; furs, 32,267,000 rubles; grain and flour, 24,829,000 rubles; cotton fabrics, 23,249,000 rubles; flax and hemp, 20,838,000 rubles.

Principal imports were: Industrial machinery and equipment, 39,231,000 rubles; iron and steel, 25,992,000 rubles; non-ferrous metals, 21,825,000; iron and steel articles, 17,217,000; crude rubber, 16,488,000; wool, 11,840,000. The principal countries taking Soviet exports in 1934 were: Germany, 23.5 per cent; Great Britain, 16.5 per cent; Mongolia, 10.7 per cent; the Netherlands, 5.3 per cent; France, 5.2 per cent. Principal countries furnishing Soviet imports in 1934 were: Great Britain, 19.9 per cent; Germany, 12.4 per cent; Mongolia, 8.9 per cent; United States, 7.7 per cent; the Netherlands, 6.8 per cent.

Trade between the Soviet Union and the United States reached a peak figure of \$138,200,000 in 1930, of which upwards of four-fifths represented

American exports. During the next three years the commerce suffered a decline of 85 per cent owing to the establishment of better trade and credit conditions by the Soviet Union in other countries. The impasse in Soviet-American trade continued until the signing of a one-year trade agreement between the two countries in July, 1935, whereby the United States extended most-favored nation treatment to the Soviet Union and the Soviet Union agreed to double its purchases.

At the close of 1935 the Amtorg Trading Corporation, official trading organization for the U.S.S.R. in the United States, announced that Soviet purchases for the year had been \$42,000,000, nearly three times the total of \$14,500,000 for 1934. (Purchases are of course not immediately reflected in export figures.) The principal items were \$27,159,000 for industrial equipment and \$8,000,000 for cotton. The remainder went largely for airplane and automotive apparatus. Principal American imports from the Soviet Union are furs, anthracite, manganese ore, sausage casings, and flax.

SOVIET-AMERICAN TRADE, 1925-35

Year	American exports to U.S.S.R.	American imports from U.S.S.R.	Total
1925	\$ 68,900,000	\$13,200,000	\$ 82,100,000
1926	48,900,000	14,100,000	64,000,000
1927	64,900,000	12,800,000	77,700,000
1928	74,100,000	14,000,000	88,100,000
1929	84,700,000	22,500,000	107,200,000
1930	114,356,000	23,839,000	138,195,000
1931	103,669,000	13,206,000	116,875,000
1932	12,600,000	9,600,000	22,200,000
1933	8,972,000	12,120,000	21,092,000
1934	14,997,308	12,337,647	27,335,355
1935	24,738,625	17,736,312	42,474,937

The Budget. In a country with such a high degree of socialization as the Soviet Union, the growth of the budget reflects to a large extent the degree of economic progress. The first "firm" budget, that of 1924-25, balanced at 1,400,000,000 rubles. The budget for 1934 envisaged revenues of 65,900,551,000 rubles and expenditures of 65,400,551,000 rubles. About 85 per cent of the budgetary revenues are now derived from the "socialized sector." The budget structure for 1935 is shown in the next column.

Government. A description of the constitution of the Union of Soviet Socialist Republics will be found in the NEW INTERNATIONAL YEAR BOOK for 1923. In January, 1936, the Council of People's Commissars (executive cabinet of the Government) was composed as follows: Chairman of the Council, V. M. Molotov; Vice-Chairmen, J. E. Rudzutak, V. Y. Chubar, A. A. Andreyev, and V. I. Mezhlauk; Commissar for Foreign Affairs, M. M. Litvinov; Defense, K. E. Voroshilov; Internal Supply, I. Y. Veitzer; Foreign Trade, A. Rosengoltz; Transportation, L. M. Kaganovich; Water Transportation, N. I. Pakhomov; Communications, A. I. Rykov; Finance, G. T. Grinko; Heavy Industry, G. K. Ordjonikidze; Light Industry, I. E. Liubimov; Lumber Industry, S. S. Lubov; Food Industry, A. I. Mikoyan; Agriculture, M. A. Chernov; State Farms, M. I. Kalmanovich; Chairman State Planning Commission, V. I. Mezhlauk; Chairman Commission of Soviet Control, J. E. Rudzutak; Internal Affairs, G. G. Yagoda.

Chairmen of the Central Executive Committee of U.S.S.R. (chosen by the Congress of Soviets): M. I. Kalinin, G. I. Petrovsky, A. G. Chervyakov, Ganzanfar Mussabekov, Netyrbay Aitakov; Faisulla Khodzhayev and A. Rakhimbayev.

SOVIET BUDGET FOR 1935

Revenues

	(1,000 rubles)
Socialized sector:	
Turnover tax	52,025,700
Deductions from profits	1,725,741
Income tax from State and cooperative enterprises	699,150
State, social, and health insurance	1,758,360
Interest, etc.	881,300
Total socialized sector	57,090,251
Revenue from the population:	
Loans	3,550,000
Taxes	2,182,750
Total from population	5,732,750
Other income (including revaluation of raw materials)	3,077,550
Grand total	65,900,551

Expenditures

Investments in national economy	35,156,891
Education, health, and public welfare *	4,804,312
National defense	6,500,000
Commissariat for Home Affairs	1,652,500
Administration	886,156
Advances for local budgets	8,977,256
Government reserve	1,962,500
Miscellaneous	5,460,936
Total	65,400,551
Excess revenue over expenditure	500,000
Grand total	65,900,551

* Expenditures for these purposes are in greater part local and do not show on the federal budget.

Budgetary receipts and expenditures during 1931-34, in millions of rubles, were:

	1931	1932	1933	1934
Receipts	23,760	30,490	39,200	49,760
Expenditures	23,070	30,160	36,000	46,950

Joseph Stalin, General Secretary of the Communist Party of the U.S.S.R., while holding no governmental office beyond membership in the Central Executive Committee, was the most powerful political figure in the country.

HISTORY

Internal Development. "We are now on the path to a well-to-do life," declared Joseph Stalin toward the close of the year 1935. The optimistic phrase was apparently not without justification. At the time Stalin spoke the daily output in key indicators of production was showing the following advances as compared with the daily output of December, 1925: Electric power 1700 per cent; coal, 540 per cent; iron ore, 1060 per cent; pig iron, 700 per cent; steel, 560 per cent. The food industry completed its production schedules for the year in less than 11 months—heavy industry by December 14, light industry by December 24.

In agriculture the Soviet Union in 1935 harvested its third successive bumper crop, setting a new grain record in Russian history. The collective farm system had demonstrated its success and by the close of the year over 90 per cent of the peasants had pooled their holdings in the collectives. With these gains the system of supply and distribution, completely reorganized in 1934, was operating with increasing efficiency, and the railway system, for years the bottle-neck retarding the whole scheme of production and supply, was at last catching up with its tasks.

These various fulfillments were accompanied by signs of increased well-being. Prices of necessities,

especially foodstuffs, dropped steadily and sharply throughout 1935, as supplies grew abundant. The card ration system of preceding years, which was abolished for bread, flour, and cereals January 1, was wiped out for other food necessities in October. The human queues waiting before foodshops during former years disappeared. Visitors returning to the Soviet Union noted that the population was better clothed, and a number of the cities began to stage fashion shows. Substantial beginnings were made in the complete rebuilding of Moscow as a modern socialist city. The first nine-mile section of Moscow's subway was opened early in 1935.

An important factor in the general economic advance of 1935 was the phenomenon of Stakhanovism. This peculiarly Russian form of rationalization of the working process, involving both a better distribution of tasks and a more efficient use of tools, stemmed from the initiative of a young coal cutter of the Donetz Basin, Alexei Stakhanov, who persuaded his superiors to let him, with his assistants, try out a new method. At the end of a six-hour shift, by cooperating their special skills, Stakhanov and his three collaborators were able to show a five-fold increase in their normal coal output. The method spread through the coal mines, with new "norms" being constantly established, and it soon began to be adapted to other industries and even to agriculture.

The abundant production along with the steady decline in commodity prices and the institution of a simplified single-price market system, led the authorities to announce, late in 1935, a new stabilization of the paper ruble, effective Feb. 1, 1936. Other factors in this move were the favorable foreign trade balance, amounting to an export surplus of nearly \$400,000,000 in the past three years; the tripling of Soviet gold production under the second Five-Year Plan; the rise of the gold fund of the State Bank to some \$850,000,000, and the reduction of Soviet foreign trade obligations to a little over \$100,000,000.

The steady increase in the buying power of the ruble was one of the major events in Soviet life during 1935. The new stabilized rate of the ruble was five to the dollar. The rate on the illegal exchanges during the transition years fell as low as 30 or more to the dollar.

The easier economic picture was accompanied by a period of added political ease. Not only was the year 1935 a tranquil one in Soviet politics, but it was a year marked by certain fundamental constitutional changes of a democratic character.

At the meeting of the Seventh All-Union Congress of Soviets in February the delegates voted to amend the Constitution to provide important changes in the representative system. Hitherto voting for delegates to the All-Union Congress was indirect. The representatives were elected by provincial congresses and by city soviets. Because of the backwardness of the rural population, the representation was heavily weighted in favor of the urban centres. There was no secret ballot. The new amendments provide for direct and secret voting, with equal representation on the basis of population for all districts. The changes were made possible by the rapid rise of literacy in the villages and by the transformation of rural economy from individualistic forms to a predominantly collectivistic system of life.

An event of great historical importance in 1935 was the successful opening of the Northeast Passage to navigation. This event was the culmination of over a decade of strenuous and daring effort

(see YEAR BOOK for 1934, p. 704). During recent years the Soviet Government has established 77 stations manned by 589 scientists and technicians, equipped with radio and with apparatus for meteorological, aerological and hydrological study, along its 300-mile Arctic Coastline. Ice-breakers have been stationed at difficult navigation points to furnish aid for merchant vessels. Last summer two merchant vessels were started from Murmansk, 700 miles north of Leningrad, bound for Vladivostok, and two others started from Vladivostok for Murmansk. All four vessels completed the 6000-mile voyage in less than three months. See POLAR RESEARCH.

Foreign Relations. The Soviet foreign outlook during 1935 was largely dominated by the increasing menace of aggression on both the western and eastern frontiers. In the west the principal factors were German rearmament and the general European tension resulting from the Italian invasion of Ethiopia. In the east the main causes of uneasiness were the resumption of Japanese aggression in North China and the increasing pressure brought jointly by Japan and Manchoukuo against Mongolia. The fact that Outer Mongolia had established a government on the Soviet model which maintained relations of friendly intimacy with the Soviet Union added to the tension in respect to that section. See CHINA, JAPAN, MANCHOUKUO, and MONGOLIA under *History*.

Under these circumstances it was not surprising that the Government, on the occasion of the meeting of the Central Executive Committee (Congress) in January, 1936, announced greatly increased expenditures for national defense. While 6.5 billion rubles had been allotted for the army and navy in the budget for 1935, it was revealed that 8 billion rubles had been spent, and the army-navy budget figures for 1936 were fixed at 14.8 billion rubles. At the same time it was announced that the army had been increased during 1935 from 960,000 to 1,300,000, that the number of submarines had been quintupled during the past few years (no totals given), that the facilities for turning out large-scale, long-range bombing planes in Soviet plants had been greatly increased, and that plans were in operation for rebuilding the Soviet navy on modern lines.

Pledged to the policy of collective security against the menace of war, the Soviet Government during 1935 continued its policy of cooperating to preserve peace through the League of Nations—which it joined in September, 1934—and in line with this policy it supported the League programme of enforcing punitive sanctions against Italy (q.v.).

A treaty was signed with France May 2, 1935, providing for mutual assistance in case of an attack upon either by a third power. Up to the end of December, 1935, this treaty had not been submitted to the French parliament for ratification. On May 16, 1935, a similar treaty was concluded with Czechoslovakia. Subsequently, June 3, a new trade treaty was concluded with Czechoslovakia, which provided for a trade loan by that country for 250,000,000 kronen to run for five years at 6 per cent. In April a new trade agreement was concluded with Germany, providing for German financial trade credits of 200,000,000 marks on a five-year basis, to apply against Soviet purchases.

In the Far Eastern sector the sale of the Soviet-owned Chinese Eastern Railway to the State of Manchoukuo was concluded in Tokyo Mar. 28, 1935, after nearly two years of negotiations. The

terms included the payment of 140,000,000 Japanese yen, one-third in cash, the remainder in goods, payments to run over three years. The sale of the road removed a focus of major irritation in that area. However, disturbing incidents along the Soviet-Manchoukuoan border continued during the year.

Though no progress was made in the debt and claim negotiations between the United States and the U.S.S.R. during 1935, a trade agreement was concluded between the two countries in July to run for one year. Under the agreement the U.S.S.R. was to receive most favored nation treatment in respect to certain reciprocal trade treaties in course of conclusion by the United States with other countries. Reciprocally the Soviet Government obligated itself to double its purchases in the United States during the year.

The Seventh Congress of the Third International, held in Moscow during the summer of 1935, evoked a note of protest from Washington to the Soviet Government. The Congress, the first held in seven years, marked a distinct change in policy of the International, as it indorsed a programme to have Communist parties in various countries line up with liberal and democratic groups to combat Fascist tendencies. However, the American State Department protested against certain statements made by American delegates at the Congress and took the view that the proceedings were in violation of the "non-propaganda" agreement signed by Maxim Litvinov, Soviet Commissar for Foreign Affairs, at the time of recognition. The Soviet Government replied that it had no jurisdiction over proceedings of the Communist International. Secretary Hull, in a public statement, thereafter recapitulated the American Government's point of view. There were no further exchanges. See COMMUNISM; CZECHOSLOVAKIA, FINLAND, FRANCE, GERMANY, HUNGARY, POLAND, RUMANIA, TURKEY, and URUGUAY under *History*.

UNITARIAN CHURCH. A denomination of independent congregational churches voluntarily uniting themselves together for more efficient religious work. The purpose of the American Unitarian Association, which is the executive arm of the denomination, is:

To diffuse the knowledge and promote the interests of pure religion which, in accordance with the teaching of Jesus, is summed up in love to God and love to man.
To encourage sympathy and cooperation among religious liberals.

And to strengthen the churches which unite in the Association for more and better work for the Kingdom of God.

The Association recognizes that its constituency is congregational in tradition and polity, and that nothing in these by-laws is to be construed as an authoritative test.

The one hundred and tenth annual meeting of the American Unitarian Association was held in Boston, Mass., May 21, 1935. According to the statistics available for 1935-36, the denomination had 389 churches; 130,045 members; 2873 Sunday school officers and teachers, and 17,629 pupils. The denominational publication is *The Christian Register*, a weekly. The officers of the Association for 1935 were: President, the Rev. Louis C. Cornish, D.D.; secretary, the Rev. Walter R. Hunt, D.D.; treasurer, Parker E. Marean. Headquarters, 25 Beacon Street, Boston, Mass. See FREE CHURCH FELLOWSHIP.

UNITED BRETHREN IN CHRIST, CHURCH OF THE. A denomination which resulted from the religious awakening of Philip William Otterbein, a German Reformed pastor, and Martin Boehm, a Mennonite preacher, and was formally

organized in Frederick County, Md., in 1800. The church is divided into 33 annual conferences, including those in China, Japan, the Philippines, Puerto Rico, and West Africa. In 1935 there were 1659 charges, 2983 organized churches, 1808 active ministers, 424,885 church members, 2838 Sunday schools with an enrollment of 426,499, including teachers and officers. The amount raised by the church for all purposes in 1935 was \$4,321,713.

The more important educational institutions maintained by the church are Lebanon Valley College in Annville, Pa., and Otterbein College in Westerville, Ohio. The official paper is the *Religious Telescope*. The *Watchword* is the young people's paper. Headquarters are in Dayton, Ohio.

UNITED STATES. Area and Population. The area of the 48 States and the District of Columbia (1930) was 3,026,789 square miles, exclusive of areas of open sea within the nation's jurisdiction, and of the Great Lakes. Non-contiguous lands under the authority of the United States (Alaska, Hawaii, the Philippine Islands, the Panama Canal Zone, Puerto Rico, Guam, the Virgin Islands, and American Samoa) had an aggregate area of 711,606 square miles. The aggregate area of the Union and these outlying lands was 3,738,395 square miles.

The population of the 48 States and the District of Columbia in 1930 (Fifteenth Census) was 122,775,046; in 1920 it had been 105,710,620. The Bureau of the Census estimated the total as of July 1, 1935, at 127,521,000, compared with 126,425,000 on July 1, 1934. That of the outlying territories and other lands under the Federal authority (1930 in general, but 1929 for the Philippines) was 14,233,389. (See article on each State, territory, or possession, for its population.)

Agriculture. See AGRICULTURE; AGRICULTURE, U.S. DEPARTMENT OF; sections on *Agriculture* under the various States; and articles on CORN, WHEAT, ETC.

Commerce. A moderate improvement in the year's volume of domestic commerce over that of 1934 appeared in 1935's total loadings of freight cars (31,518,372), which exceeded the total for 1934 by some 2.2 per cent. With regard to the manufacturing industries, evidence of growing activity appeared in the Labor Bureau's estimates of the monthly percentage of the normal level of employment (the years 1923-25 being taken as the norm); the percentage rose to 85.3 for November, 1935, from 78.4 for November, 1934, the gain being nearly 9 per cent of the latter figure. The year's production of electricity, indicative of commercial and industrial as well as other activities, was estimated at 92,500,000,000 kw-hr, an excess of some 9 per cent over the total for 1934. The daily clearances of banks in 25 leading cities averaged some 9 per cent ahead of corresponding dates for 1934, for the first half of 1935, and some 21 per cent ahead for the second half; they reflected heavy governmental and financial payments as well as commercial activity. The year 1935 offered this contrast to its predecessor, that during this second half (or from within a few weeks after the Supreme Court's invalidating the NRA) the chief improvement occurred, whereas in 1934 a recession followed the midyear. The course of commercial prices in 1935 was mainly firm, though greater harvests reduced the prices of some crops materially.

Foreign trade was marked by a sharp rise in exports during the last quarter and a consistent increase of the monthly imports over the cor-

responding figures for 1934. The year's excess of exports was less than half that for 1934. The monthly and yearly totals appear in the accompanying table.

IMPORTS AND EXPORTS BY MONTHS
[In thousands of dollars]

Month	Imports		Exports	
	1935	1934	1935	1934
January	\$166,832	\$135,706	\$176,223	\$172,220
February	152,491	132,753	162,999	162,752
March	177,356	158,105	185,064	190,938
April	170,500	146,523	164,127	179,427
May	170,533	154,647	165,456	160,197
June	156,754	136,109	170,244	170,519
July	177,354	127,229	173,181	161,672
August	169,030	119,513	172,183	171,984
September	161,649	131,658	198,264	191,313
October	189,265	129,635	221,235	206,413
November	169,385	150,919	269,310	194,712
December	186,648	132,258	223,737	170,654
Total	\$2,047,797	\$1,655,055	\$2,282,023	\$2,132,800

Mineral Production. The article **METALS AND MINERALS** gives the latest available official figures for mineral production in the United States. The more important minerals mined in the United States are treated in separate articles. There are also paragraphs on mineral production in the articles on the individual States.

Railways. See separate article on **RAILWAYS**.

Shipping. See articles on **SHIPPING** and **SHIP-BUILDING**.

Finance. See article on **PUBLIC FINANCE**.

Education. See the articles **EDUCATION IN THE UNITED STATES** and **UNIVERSITIES AND COLLEGES**. Separate articles on the most important universities and colleges also are given under their respective titles. Sections on education are included in the articles on the several States.

ADMINISTRATION

General Situation and Policies. The statutory foundations of the Administration's newly reared mechanism for the direction of the country's economic welfare was shattered in places, shaken in others, by adverse decisions of the Supreme Court and lower Federal courts. This reverse diminished the prestige that the Administration had won and held by nearly two years of rapid, sweeping, and previously irresistible innovation.

The laws devaluing currency, monopolizing gold, and eliminating the stipulation of gold value from contracts of debt were, however, in great measure affirmed by the Supreme Court. Its denial of the power of Congress to abrogate the Government's own prior pledge of its faith and credit was offset by its denial of obvious practical recourse at law for the Government's creditors. Uncertainties as to the status of money and debts were circumscribed; one grave impediment to new commitments was thus removed.

Industry and commerce made fairly continuous improvement in many lines after March and, particularly, after the Supreme Court's demolition of the NRA in May. But the hopes of a broad general return to the pre-depression level of activity was still deferred: the Federal Government had to continue, throughout the year, supporting millions of people who would formerly have gained livelihoods through the natural activity of their trades. The Federal billions, passing from these people's pockets into commerce, gave an abnormal lift to business.

The public temper grew more diverse. Most farmers remained satisfied with subventions from the AAA and with the limitation of cultivation;

yet cotton-growers in Texas and tenant farmers in Arkansas became dissatisfied. Popular disappointment at the Supreme Court's overthrowing some of the features of the "new deal" bred sympathy for more radical proposals of political change. The destitute dependents on Federal support were disposed to ask for more. Resentment of artificially high prices for foods began to appear in some places. Labor unions were alarmed and angered by the overthrow of the NRA; for though they had fought some of its features they wanted to keep and strengthen the opportunity it gave them to deal with employers.

Developments in Policy. Deference to a growing demand for the redistribution of wealth prompted the President to call on Congress to apply to great fortunes such heavy taxation as would tend to use them gradually up. He obtained for the labor unions the enactment of a law that granted them a stronger position in collective bargaining than the National Recovery Act had afforded. He made the passage of provision for Federal grants toward pensions to the elderly and insurance against unemployment cardinal points of his social policy; likewise, a measure to break up the great holding companies that dominated the field of the electric and of other public utilities.

In administrative matters the Administration adopted the course of shifting the destitute from the receipt of plain support to the basis of wages paid them for work on public undertakings; such undertakings were represented as likely to yield a return in public benefit; the transfer, moreover, tended to dispel the evidence of unemployment, discourage work-dodgers, and demobilize the supported idle, in advance of a Presidential year. As to money, the policy of 1933 was reversed; ostensible approaches were made to Great Britain and other foreign powers, to the end of a general fixation of the values of currencies. Other steps, too, were taken to renew confidence on the part of capital: the President announced, after the adjournment of Congress, the virtual completion of immediate designs for social alteration. Much attention was given to preserving the strength of Federal credit; incurred deficit was covered largely in such ways as did not involve new borrowing, and a new enactment gave the Administration stronger control over the Federal Reserve system's interventions in the market for Federal bonds.

Opposition to the "New Deal." The course of the Administration drew persistent though ill concerted fire from each of two opposite directions. Conservative Republicans condemned what they regarded as abuse of the executive power and of the credit of the Treasury; radicals drew great and enthusiastic followings with proposals that nigardly distributions from the public Treasury be greatly augmented, to the benefit of the needy. Senator Huey Long (q.v.) of Louisiana advocated with energy and persuasiveness the proposal to share "our" wealth, promising that it would provide enough to make "every man a king." He thus gained a strong following in a number of the Southern States and had risen to the stature of a possible bidder for the Presidency in 1936 when one of his enemies in Louisiana ended his life. Father Charles E. Coughlin of Detroit, addressing a great audience periodically over the radio, condemned the Administration as distributing too little for the benefit of the needy and as acting in accordance with the views of the "money changers" whom the President had proposed to drive from the temple; organizations supporting Father

Coughlin's ideas were set up in divers States, with a view to later political activity. In California and other Western States the proposals of the Townsend group, urging Federal pensions of \$200 a month to the elderly, were widely approved.

The continued expenditure of about twice the Federal revenue and the consequent strain on public credit provided a target for the concentrated criticism of a group of men versed in finance or in public affairs: Ex-President Hoover (October 5) declared that "a gigantic spending bureaucracy" was "joyriding into bankruptcy"; former Secretary of State Bainbridge Colby (October 18), that the nation wondered whether bankruptcy could be avoided; the Administration's own former Director of the Budget, in a series of speeches in the East, that the New Deal's policy of expenditure could only stave off a "day of reckoning." These critics were relatively few; a much greater mass of opposition was concentrated on the Administration's hints of intent to seek Constitutional amendments to liberate the Executive and Legislative branches from the restraint of the Judiciary. Efforts were made in a number of the chief cities to observe Constitution Day (September 17) with more than usual ceremony, as an occasion for rallying the constitutional traditionalists. The Union League of New York issued a statement charging the President with attacking the Constitution in violation of his oath of office to defend it.

The National Association of Manufacturers, at a conference in New York, adopted on December 5, a "platform" frankly hostile to the Administration; this document proposed the repeal of legislative acts essential to the "New Deal"; urged the abandonment of a planned economic recovery; and condemned the direction of policies by persons not elected to authority.

The President. President Roosevelt met with increasing difficulty, during the year's protracted session of Congress, in maintaining his great influence over legislation. He made his will prevail over a strong element in Congress that would have set aside his plans for a law to ban holding companies in the field of public utilities, and the proscription of such companies was enacted, though in attenuated form. A similarly qualified victory for his influence was scored in the enactment of heavy taxes on the great private fortunes and on the incomes of the greater corporations. Substantial majorities in both houses voted for paying the veterans' bonus, against his veto, a veto delivered for the first time in the Nation's history by a President in person; but the veto stood.

In the choice of his immediate associates and advisers the President did not conspicuously extend his earlier resort to the services of academic intellectuals. Survivors of the "Brain Trust" of 1933 still held some important posts in the Administration but the enlistment of aides from the academic group had been largely given up.

The President addressed the public on several occasions. He delivered by radio one of his "fireside talks" on April 28, advocating the measures then pending for extending the life of the NRA (not yet invalidated by the Supreme Court), for "economic security" (pensions for the aged and insurance against unemployment), for Federal regulation of public utilities, and for amendments to the Federal Reserve banking system; he also outlined the plan on which his project for the expenditure of \$4,000,000,000 already appropriated for "work relief" was to operate. In an address to a great delegation of farmers on May 14, he de-

fended the steps that had been taken to reduce agricultural production and the measures for butchering animals during the drought of 1934; he spoke satirically of the "crocodile tears shed by the professional mourners of an old and obsolete order over the slaughter of little pigs." He did not address the country directly on the occasion of the Supreme Court's overthrowing the NRA. But on August 24, in a speech by radio to a convention of the Young Democrats of America gathered at Milwaukee, he denounced "Tories," declared that rules were not necessarily sacred, and asserted that "the methods of the old order are not . . . above the challenge of youth." He had previously, a few days after the NRA decision, said in a press conference that the Supreme Court's action took the nation back to horse-and-buggy days.

Starting on a trip to the Pacific Coast on September 26, the President made several speeches on his route. At Fremont, Nebraska, he defended his agricultural programme against allegations of unconstitutionality, declaring it "an expression in concrete form of the human rights . . . perpetuated by the adoption of the Constitution." Dedicating the Boulder Dam, he stated that governmental spending had already begun to show signs of its effect on spending by consumers and that the time was at hand when private industry must take the principal part in accelerating employment. At Los Angeles he said: "We have come through stormy seas into fair weather," complimented California on its liberalism, and urged that all liberals act in harmony, taking "a common road." At the San Diego Exposition he spoke of the restoration of public confidence, the strength of the Government's credit, the success of the Federal efforts to relieve private need, of business improvement effected since his inauguration, and of the determination of the Government not to become involved in foreign wars.

Attacked with great severity and apparent injustice by such radicals as Huey Long and Father Coughlin for having failed to make good earlier promises to mend the state of the distressed classes, the President refrained from verbal reprisals. Federal moves against Long and his partisans in Louisiana, such as the withholding of Federal money from that State and proceedings against members of the Long group for tax-dodging, took the form of routine Federal procedure and not of overt Presidential retaliation. On August 24, immediately after the assassination of Long, Mr. Roosevelt entertained at luncheon at Hyde Park Father Coughlin, who had declared his support for Long some time before; this was taken to imply an overture on the President's part for harmony with Coughlin and the great audience that Coughlin swayed. The President had already, some weeks before, adopted one of Long's chief proposals by insisting that Congress thwart the perpetuation of great fortunes by prohibitive taxation.

Outward relations with leaders of the old individualistic system were not marked with an equal mildness on the President's part. While not singling out individuals, he told the farmers' delegation on May 14 that "the high and mighty, with special axes to grind, have been deliberately trying to mislead people who know nothing about farming by misrepresenting—no; why use a pussy-foot word?—by lying about the . . . farm programme." He rebuffed the Chamber of Commerce of the United States, convening in Washington at the beginning of May, and known to be critical

THE NEW SUPREME COURT BUILDING

The Court held its first session in this \$10,000,000 structure on Oct. 7, 1935.

PRESIDENT ROOSEVELT SIGNING THE SOCIAL SECURITY BILL, AUG. 14, 1935

Front row, left to right: Representative Robert L. Doughton (N. C.), Senator Robert F. Wagner (N. Y.), Secretary of Labor Frances Perkins, President Roosevelt, Senator William H. King (Utah), Representative David J. Lewis (Md.), and Representative Samuel B. Hill (Wash.)

toward his policies, by refusing it the usual message of greeting. But he differentiated between captains of industry and business as a whole; told the press that the Chamber did not truly represent the latter; and on September 6 gave out a letter to Roy W. Howard holding out to business the assurance: "The basic programme . . . has now reached substantial completion and the breathing spell of which you speak is here."

Giving much of his own time and attention to the programme of "work relief," the President showed himself bent on avoiding the outcome in the case of the PWA, which had not succeeded in attaining a scale of public expenditure to match his original intent. He voiced in his "fireside talk" of April 28 his anticipation that the new programme would be "in full swing by autumn."

Monetary Regulation. The sweeping innovations in the administration of the Federal power to regulate the value of money, which prevailed in 1933 and 1934, gave way gradually to measures of monetary stabilization. While the Treasury's regulations against the possession of gold and silver preserved these metals, with specified exceptions, as a governmental monopoly, rules prevailed under which gold could readily be transferred between the United States and any other country allowing such transfers. The prevailing current of dealings in gold during the year, however, was toward the United States. In January and February, anticipating the possibility of early decisions in the Supreme Court, which might find against the Government in the gold cases, holders of gold abroad sold it to obtain dollars. In May the financial situation of France caused a heavy migration of gold from that country, mainly to the United States; the Treasury, out of an ample balance of cash, tendered dollars freely, through its agents, against offerings of French francs, thus assisting France in keeping the franc at its approximate value in relation to the metal, and checking the outflow of French gold. Again, in September and October, this time on account of fear of war in Europe, gold came to the United States in great quantities. The combined effect of the three gold waves was to augment the Treasury's gold stock substantially; the Treasury had \$9,584,000,000 of monetary gold on October 16, as against \$7,990,000,000 a year before, the increase being by one-fifth.

Another cause of this increase was the Treasury's demonstration of intention to keep the value of the dollar stable, for the time at least, in relation to gold. Secretary of the Treasury Morgenthau declared in the course of a speech by radio on May 13 that the Government was ready to join other powers in a concerted stabilization of currencies. The idea was further hinted to other of the chief governments, but was discouraged by Neville Chamberlain, British Chancellor of the Exchequer, in a public address on October 1. Nevertheless, the impression spread that the Administration was no longer, as in July, 1933, averse to the idea of a dollar of fixed metallic value. This impression worked to the advantage of the Administration's plans as to the public debt.

The Bidding-Up of Silver. The Government continued to purchase new silver from domestic mines and to offer to buy silver abroad, a course required by the Silver Purchase Act of 1934. The price that it bid, however, remained 64.64 cents an ounce until April 10. This was one-half the maximum contemplated by the act. Failure to advance the bid agitated the chief backers of the act, and

they considered further action in Congress. The President dealt with the situation by a proclamation of April 10 reducing the seigniorage on silver to 45 per cent, from 50; in effect, raising the price by 10 per cent, to 71.11 cents an ounce. Senator Wheeler nevertheless introduced a bill for the compulsory Federal purchase of 50,000,000 ounces of silver a month. The President in turn raised the Government's bidding price on April 24 to 77.58 cents an ounce, or 60 per cent of the contemplated \$1.29. This brusque lifting of the bid by one-fifth in a fortnight threw the foreign silver markets into a speculative frenzy; the foreign quotations approximated an American equivalent of 81 cents, hard upon the news of the final rise in Washington's bid. This implied that no one was selling foreign silver to the United States, all preferring to sell abroad or to wait in hope of a still higher price from the United States. Within four days the foreign silver markets broke below parity with the American bid; a second slump followed on July 9, in which it was reported that some 12,000,000 ounces were unloaded on the Treasury by the market in London. Secretary Morgenthau stated on June 11 that the Government had bought 421,497,000 ounces of silver in the time from Aug. 1, 1934 to May 31, 1935. This included 112,850,000 ounces of nationalized silver taken over at 50 cents, 283,000,000 bought in open markets and delivered, and 25,647,000 of newly mined domestic silver. The sharp lifting of the Federal price in April served to show that enhanced bidding merely provoked an unstable speculation in the metal.

The Treasury altered its policy of purchasing silver, by ceasing, without warning, on December 10, to bid any price at all for the bulk of the offerings of this metal in the chief foreign markets. The market in London was consequently unable to transact business in silver on that day; subsequently the price of silver abroad ruled sharply lower than that paid by the Treasury for the product of domestic mines, which was maintained. See CHINA and MEXICO under *History*.

Extinction of Bank Notes. The Treasury had at the beginning of the year a sum in "free gold" certificates amounting to some \$650,000,000, less an unstated portion previously paid out; the sum represented the balance that remained of the dollars brought into existence by the Government's taking the gold from the Federal Reserve banks in 1934 and putting a higher dollar valuation thereon by law, after the greater part of these newly-created dollars had been set aside as a fund with which to render the monetary system stable in foreign exchange. National banks' holdings of Federal bonds, posted with the Government to secure National Bank notes of equal amount, totaled some \$677,000,000, chiefly in 2 per cent consols and Panama Canal bonds but also partly in other Federal bonds admitted temporarily to the circulation privilege under an act of 1932. Armed with an act of 1935 the Treasury called, for redemption on August 1, all the 2 per cent consols and canal bonds, about \$675,000,000 in principal, of which some \$531,000,000 was pledged for bank notes. Some days earlier, on July 22, the circulation privilege on other bonds used to secure bank notes expired. Thus by August 1 all bank notes had been covered by payments from the issuing banks to the Treasury, while the only bonds that remained endowed with the unlimited circulation privilege had been retired. The type of currency on which largely the National banks had been built up was terminated.

The operation yielded the Government the advantage that it reduced the public debt by \$675,000,000 while reducing its immediate cash balance by only some \$180,000,000, the cost of redeeming the bonds not pledged for circulation and of returning to the banks their statutory 5 per cent deposits—plus the relatively small payment made to meet bank notes immediately presented for payment at the Treasury. Experience had shown that bank notes returned only gradually after they had been called in; until they did so the Government had the use of the cash. It was possible, in consequence largely of this operation, to run through a great part of the year without increasing the public debt, even though the deficit continued to rise.

Federal Obligations in Payment of Taxes. The Commissioner of Internal Revenue issued instructions on June 9 to collectors not to accept in payment of income taxes certain Treasury notes falling due on June 15, except at their face value in the devalued dollar. It had been reported in May that plans were in preparation to offer such notes for payment of Federal taxes at their face value (gold) in the old dollar, as the terms of the notes were contended to permit. The contemplated litigation was designed to determine the legal standing of sundry of the funded debts of the United States as media for the discharge of tax debts to the government, a matter on which the Supreme Court had not specifically passed in the gold decisions.

Federal Finances. The year in Federal finances was characterized by higher Federal revenues during most of its course, by a slackening of the increase in the public debt, and by a generally though not uniformly eager market for the Government's paper. The Federal Administration's new leanings toward monetary stabilization helped its credit and so facilitated the further conversions by which the last of the Liberty bond issues was extinguished.

Receipts and Expenditures. The President introduced on September 29 an intended annual presentation of a "Summation of the Budget." The document then given out set forth the state of the budget for 1936 as Congress, on adjourning, had left it. It also summarized the actual receipts and expenditures of the fiscal year that had ended with June 30, 1935. These were: receipts, exclusive of postal revenue, \$3,800,467,202 (\$10,421,470 being realization upon assets and the rest revenue); expenditures, \$7,375,825,166 (of which \$4,262,257,209 was for "recovery and relief," \$820,926,353 for interest and \$573,558,250 for statutory retirement of debt). There thus appeared a deficit, for the year, of \$3,575,357,964 in all, or of \$3,001,799,714 exclusive of the cost of retiring debt. The President had proposed to Congress in January, 1934, that the Government spend \$9,403,006,967 in all of the then half finished fiscal year 1934 and between \$3,960,798,700 and \$5,960,798,700 for the fiscal year 1935, both exclusive of debt retirements. The Administration had consequently spent only a relatively slight amount above the low limit of what it had budgeted for the two years. The extraordinarily high appropriations for "relief and recovery" that the President had asked for finishing the fiscal year 1934 had, with further relatively moderate appropriations for the fiscal year 1934, carried the Government through well below the President's upper estimate. The effect, whether designed or not, was to create greater ease of temper, both in Congress and among the public,

than had budgets merely foretold, or had they failed to match, the actual expenditures of the two-year period.

The budget for the fiscal year 1936, as revised in the "Summation," to accord with the measures of the Seventy-fourth Congress (first session), estimated total receipts at \$4,470,349,140 (\$4,366,409,335 in revenues and \$103,939,805 in realization upon assets); expenditures, at \$7,752,332,000 (of which \$4,154,824,000 for "recovery and relief," \$551,000,000 for retirement of the public debt, and \$745,000,000 for interest). A lower total than that for 1935 in estimating interest was rendered possible, in spite of a higher debt, by the conversions of old issues of bonds into new issues bearing much lower rates of interest. As regards total expenditures for the fiscal year 1936, Congress appropriated, according to the "Summation," \$8,671,427,171, but the President had subsequently made deductions in his estimates for public works.

In the first half of the fiscal year 1936 (last half of calendar year 1935) expenditures attained \$3,781,660,702; in spite of the non-collection of some \$200,000,000 of processing taxes, the total receipts of the period, \$1,902,009,509, actually exceeded those for the corresponding period a year earlier, the flow from most of the sources of income having improved.

Uncertainty as to Processing Taxes. The President included in the above-stated estimate of receipts for the then-current fiscal year 1936, \$536,000,000 for processing taxes on agricultural products, and he allowed for an outgo, from these taxes, of \$555,000,000. But there was in progress at the time a movement among firms liable for these taxes to sue out injunctions against their collection, on the ground that the Agricultural Adjustment Act had transgressed the Constitution in laying them. The issuance of such injunctions became quite common by mid-autumn. The receipts from processing taxes correspondingly fell; the Government was pledged to the growers, to pay them their fees for limiting cultivation or the raising of animals. It thus ran risk of having to make the payments by recourse to borrowing, unless or until the law should be approved by the Supreme Court.

Debt. The Federal gross public debt rose from \$27,053,141,414 on July 1, 1934, to \$28,700,892,654 on June 30, 1935. This increase, of \$1,647,751,210 for the fiscal year, was smaller by \$1,354,048,504 than the year's deficit, net of statutory retirements of bonds. The difference was made good out of a previously very high balance of the general fund, out of certain of the special funds' excesses of receipts, and out of gold "profit" from revaluation, monetized to the total of \$91,415,650 by the issuance of gold certificates which were paid out to retire bank notes. (See also *Extinction of Bank Notes*, above.) New resort to borrowing after June 30, raised the gross debt to some \$30,557,000,000 by the end of the calendar year, the increase approximating \$1,856,000,000 for the six months.

The Treasury redeemed, by call, during the year, the remainder of the issues of Liberty bonds; \$1,850,000,000 of the Fourth Liberty 4½ per cent issue were redeemed on April 15; \$1,933,209,950 (the remainder) of the First Liberty 3½ per cents were called on March 14 for redemption on June 15; \$1,250,000,000 (the remainder) of the Fourth Liberty 4½ were called on April 14 for redemption on October 15. The bulk of the holders of these issues accepted in exchange either bonds bearing 2½ per cent interest, callable in 1955 and

maturing in 1960, or else securities of shorter maturity. Thus was completed in two years the retirement of some \$8,200,000,000 of Liberty bonds. The operation was rendered advantageous to the Government by the superabundance of funds in banks and the consequent demand for investments, carrying the limitation of Federal bonds as to taxation, at unusually low rates of interest. All the bonds that were called carried the gold clause, but there remained a substantial total of Federal bonds of later issue, yet prior to the abandonment of this clause and therefore carrying on their face the promise of the Government to pay at the old gold value of money. None of the latter bonds were callable before 1940; all involved for the Government some risk of being obliged to make good its promise in the event that any means should be found at law to compel the Treasury to cease the denial of payment in the old value, a denial that the Supreme Court had condemned in the gold cases (*See Judiciary*).

Popularizing Federal Issues. The Treasury sought to increase the number of takers of its obligations by issuing a new type of security called United States Savings Bonds (popularly, "baby bonds") and by offering certain issues of ordinary types to the highest bidders for any part thereof. The savings bonds somewhat resembled the savings certificates of some 15 years earlier. Instead of paying interest periodically they were purchasable at three-fourths of their face value (in denominations from \$25 to \$1000). They matured in 10 years and thus yielded nearly the equivalent of 29 per cent per annum (compound) in appreciation. They were not transferable except in special cases, as of decease; they were redeemable at the possessor's option, but at rates yielding less than 2.9 per cent per annum for any period less than the full 10 years; nor were they redeemable before maturity literally at presentation, but only after approval of the application for repayment by the proper officials at Washington.

The sale of ordinary obligations to highest bidders varied with the usual previous practice of the Treasury, to offer the Government's securities at some set price and to prorate allotments among the normally excessive bids. The new method worked well on several occasions but failed on one occasion, late in August, to bring in enough acceptable bids for \$100,000,000 of four-year bonds of the Federal Farm Mortgage Corporation, bearing the Government's guarantee.

The New-Deal Organizations. Among the Federal bodies that had grown out of the "New Deal," those most prominently connected with the year's events might be put into two groups, the first designed primarily to help one or another social class, and the second having for their main functions the restriction of certain interests.

In the first group, the NRA (National Industrial Recovery Administration) was disrupted by an adverse decision of the Supreme Court, but its name survived in a curtailed organization; the AAA (Agricultural Adjustment Administration) carried on its work, of restricting agricultural production and of paying farmers bounties to cut their output for their own benefit, although it was threatened by attacks on its constitutionality; the PWA (Public Works Administration) failed to take up the expected amount of the slack in employment through its promotion and financing of public works; the WPA (Works Progress Administration), somewhat resembling the CWA of

1933, was set up in order to supplement the PWA's efforts to eliminate the dependent idle; the FERA (Federal Emergency Relief Administration) continued until the closing days of the year to dispense support to many for whom these other agencies had not yet provided employment; the CCC (Civilian Conservation Corps) was expanded in order to care for a greater number of otherwise unemployed young men; the HOLC (Home Owners' Loan Corporation) started further extensive lending to mortgagors; the RRA (Rural Resettlement Administration) succeeded the Subsistence Homesteads Division and greatly extended plans for moving families into locations deemed more advantageous; the National Youth Administration (within the WPA) was created, to provide "work, relief, and employment" for young people under the age of 25 years, with particular reference to students; the REA (Rural Electrification Administration) was formed to promote and to finance, by loans, public or private projects for supplying rural areas with electricity.

In the second group, the TVA (Tennessee Valley Administration) gained more local adherences to its proposals to supply its area with electricity at less cost than that from private companies; the SEC (Securities Exchange Commission) eased some of its restrictions on commerce in securities; the FACA (Federal Alcoholic Control Administration), having derived its main regulatory powers from the Recovery Act, died with the NRA and was replaced by a less powerful Federal Alcohol Administration, set up in the Treasury Department; the Federal Trade Commission was directed to act jointly with the new, curtailed NRA in supervising the drawing of voluntary codes for the regulation of business groups, and it issued a series of reports, largely adverse, on the affairs of electric holding companies.

End of the First NRA. The Supreme Court's decision of May 27 in the *Schechter* case rendered it immediately apparent in all quarters that the NRA as constituted nearly two years before could not go on functioning to regulate prices, production, the codified relations within business groups, the conditions of labor, or the settlement of disputes between employer and employee. The NRA was about to expire by the statutory limitation of its life, and Congress was at the time busy with a bill to extend its duration and amend it. Instead, it passed an act to preserve under the same name, temporarily, a few of the wholly secondary functions of the organization.

The NRA had up to this time expended some \$94,000,000, as estimated by the National Industrial Conference Board, in administering codes and in other cognate activity. It employed about 5400 people, most of whom passed, at least temporarily, into the employ of other Federal organizations, the new NRA included. The Attorney-General had in his hands 411 cases, then in the courts, in which he was suing or prosecuting on the NRA's behalf. All these cases, largely involving infractions of codes, were dropped; among others, the *Houde* and *Weirton* cases.

NRA's Economic Sequels. Within a few days after the *Schechter* case had been decided there followed more or less cutting of prices, particularly in the retail sales of such goods as cigarettes, toilet wares, and books. According to a statement issued by the American Federation of Labor on June 6 fully a million recipients of wages were subjected to cuts in pay or to longer hours of work in the course of the six business days follow-

ing the decision. Struggling industries such as the cotton-garment trade, lumber, hotels, and many retailers were reported to have been chiefly active in these changes. Industries that were better off quite commonly declared for maintaining wages or for continuing to follow the existing codes for their regulation. The President, by executive orders, prolonged the existence of the National Labor Relations Board, the Steel Labor Relations Board, and the similar board for the textile industry until the advent of the successor board provided by the Wagner Act. Organized labor, though it had shown dissatisfaction with the NRA, resented the loss of the privileges accorded it by Section 7-A of the Recovery Act; it took the enactment of the Wagner Labor Disputes Act, restoring and amplifying the privileges of labor organizations under 7-A, to remove the risk of an outbreak of strikes.

Fate of Codes. Even before the invalidation of the NRA the effort to regulate industry in almost all its branches through codes had met with great difficulties in some quarters. Not only had Henry Ford, commonly esteemed the most prominent person in the manufacturing world, refused to the end to sign any code, but there had occurred defections as time went on, and as the course of suits in the Federal courts set more and more against the NRA's authority. The mail-order firm of Montgomery, Ward and Company consistently refused to pay dues demanded of them to meet the cost of administering the retail code and were consequently excluded from sales to the Government. The Department of Justice having dropped the Belcher case, its chief effort to enforce the lumber code, the Lumber Code Authority took the position that this, "in effect if not in fact," was equivalent to the suspension of the code; the implication was that if the Government would not protect followers of the code against infractions by others it could not expect the former to cling to the code, unprotected.

With regard to the voluntary codes for which provision was made after the end of the old NRA, their value to industries adopting them remained in some doubt, since the abolition from certain provisions of the anti-trust laws, granted to subscribers to codes under the NRA, might no longer apply to subscribers to voluntary codes. The act "extending" the NRA in its attenuated form, authorizing such codes, did grant the President authority to allow a limited suspension of the anti-trust laws antagonistic to these agreements, but the validity of the proceeding had still to be tested. The first voluntary code to be presented, that of the Wholesale Tobacco Distributors, approved by the Federal Trade Commission on July 19, contained not only minima for wages and hours of work but also rules to govern trade practices.

Labor and the NRA. The American Federation of Labor contended vigorously, during the earlier part of the year, to displace company unions in collective negotiations with employers and to gain a hold upon industries that had not been unionized. Dissatisfied with the President's action of extending the term of the then-existing automobile-manufacturing code, the council of the A. F. L. imputed the responsibility for this course to Donald R. Richberg, secretary of the National Emergency Council and guiding spirit of the NRA. Richberg, who had served labor unions as a lawyer, was denounced as a "traitor" by high officials of the A. F. L. Eighty local unions in the mainly non-union automobile industry had declared on

January 24 against further coöperation with the Automobile Labor Board, a body created by the President in March, 1934. This body was nevertheless continued as the Government's representative in labor matters in its field. This board, despite the unions' opposition, held a series of elections in the great automobile-manufacturing establishments, to determine the employees' choice for or against affiliation with unions. The votes generally gave heavy majorities in favor of nominees unaffiliated with the A. F. L., for representatives in collective bargaining. Those favoring the A. F. L. were some 30 per cent of all who voted in the industry.

A strike was started on April 23 in the Chevrolet manufactory at Toledo, but did not spread to the chief centre of the industry, in the Detroit area. Some ten days later the strike was settled, the company agreeing to deal with the A. F. L. representatives as spokesmen for those employees who had become affiliated with the Federation. It thus chanced that the drive to effect the plans of the Federation in the foremost un-unionized industry came to a halt three weeks before the overthrow of the NRA. No general outbreak of labor troubles followed the latter event, although a strike of longshoremen at the Gulf ports in the autumn led to a number of local affrays and to delays for shipping.

The Abbreviated NRA. The NRA as extended, by resolution of Congress, beyond June 12, had as Administrator James L. O'Neill. In addition to preparing data on the earlier work of the NRA, its function was to collaborate with the Federal Trade Commission in handling such voluntary codes as the members of industries might wish to set up in order to regulate their practices. It terminated on September 5 the use of the "Blue Eagle," the emblem of compliance with the Recovery Act of 1933. A new National Labor Relations Board, created by the Wagner-Lewis Act and separate from the NRA, was set up in August, to mediate in labor disputes and to judge the rights of employees to organize as provided in the act. An executive order of December 12 required that the skeleton of the NRA be dissolved on Jan. 1, 1936; the Consumers' Division was transferred to the Department of Labor; the Division of Review, Division of Business Cooperation, and Advisory Council were transferred to the Department of Commerce.

Managed Crops and the AAA. The AAA, according to a report of the Comptroller-General, expended in 11 months ended with May 31 a total of \$767,195,306; this, chiefly in \$535,547,699 dispensed to farmers for restricting their production, \$145,595,565 devoted to buying up and processing animals that were starving in drought-stricken areas and to furnishing farmers in such regions with seed, and \$34,401,654 for administrative expense. The organization had to stand criticism from groups irritated by a rise in the cost of food, from the Brookings Institution, which reported doubt of the merit of "indefinite continuation" of the control over production of wheat, and from those who complained of the presence of men of allegedly radical bent in its personnel. Several men left the AAA in February, its counsel, Jerome Frank, included, on account of the latter criticism. The AAA maintained that though the level of prices for food had risen, that of earnings in employment had risen yet more. To demonstrate the popularity of the AAA among farmers, some 3000

from nearly a score of States, chiefly Southern, made a concerted trip to Washington in May and appeared at the White House. The question of the spontaneity of this demonstration was discussed in the Senate.

Dry weather in the winter and early spring afflicted much of the grain belt and thus threatened the country with an absolute shortage of wheat and Indian corn, of which the previous deficient harvest had caused the surplus to shrink below safe limits; the AAA therefore lifted on March 20 the restrictions on the planting of spring wheat. Grain in some quantity was later imported.

While the industries using foodstuffs as their raw materials were slow to resort to the courts for remedies against the harm that some of them sustained from the processing taxes and scarce supply, the Northern cotton textile industry acted otherwise. A strong movement of opposition to the policy of Secretary of Agriculture Wallace arose in New England, where many cotton mills were taking losses. Mr. Wallace rejoined in a speech at Atlanta, on April 13, with a warning that if opponents should succeed in overthrowing processing taxes more severe methods to protect cotton-growers and other farmers might follow.

At Brunswick, Me, on April 17, Mr. Wallace charged New England's textile manufacturers with whining and with advancing "chiseling claims for special power, concealing their true motives under a cloak of false publicity." In the tense state of New England feeling that followed, the receivers of the Hoosac Mills brought suit at Boston to invalidate claims against them for payment of the processing tax on cotton that these mills had used. The suit, denied by the Federal District Court, went to the Circuit Court, which held on July 16 (after the Supreme Court's NRA decision) that the processing tax was unconstitutional. There followed an avalanche of other suits against like taxes.

Many who first sued over processing taxes sought and, in a number of instances, obtained decisions declaring the processing taxes on a variety of farm products to be void. Later the tendency was for manufacturers to withhold payments of such taxes and to obtain Federal injunctions preventing Federal officers from collecting; thus the chief meat-packing companies applied at Chicago for an injunction on July 29. By August 20, 1148 temporary injunctions against the collection of processing taxes had been granted, according to the Department of Justice. Actual collections of the taxes fell off even in advance of the shower of injunctions; from a total of \$30,950,261 for June, the collections declined to \$15,364,401 for July. In the autumn the AAA faced the difficulty of having to go on paying farmers, under its bargains with them for restricting crops, though the Government no longer received from processing taxes the requisite amounts for this purpose. The amendment of the Agricultural Adjustment Act by Congress occurred while suits against the AAA were in progress; this brought into the litigation the additional issues raised by the new act's provisions to hinder suits against processing taxes.

The operation of punitive taxes applied by divers laws to non-conforming farmers seeking to market such products as tobacco and cotton, was disturbed by yet other suits. Governor Talmadge of Georgia, acting as an individual farmer, was one of the number who sued against the tax of 6 cents a pound applied by the Bankhead Act to cotton produced outside of allowed quotas. The Potato Con-

trol Act of 1935, which would have imposed a similar tax, was marked by the AAA for probable non-enforcement, for lack of funds, on the ground that Congress had not passed an appropriation to cover the cost of administering it. A plan for paying farmers a bonus of 25 cents a bushel to divert potatoes to the feeding of livestock, the making of starch, and other uses was drawn up as an administrative substitute. An effort to enforce discipline on milk dealers through a Federal system of licensing in Boston was checked on May 17 by an adverse Federal District Court decision (Judge Brewster), at a time when New York and some States adjacent to it were planning for Federal control of milk in their area.

The case of cotton differed from those of most other crops in that the growers continued to produce considerably more than the market would take of American raw cotton. Cotton exports fell off heavily, and domestic mills found the textile demand at home disappointing. This necessitated the continuation of Federal loans on cotton held off the market. But the AAA, confronted by the inroads made by Brazil and other countries on the American exports of cotton, decided against maintaining the old rate of lending at 12 cents a pound on the basic grades. Instead, it announced on August 22 a rate of 9 cents a pound with compensation in the form of a bonus of 3 cents a pound or whatever lower differential would bring the growers' receipts up to 12 cents, this bonus to be payable when cotton had been sold. Pressure in Congress forced the AAA to raise the rate for the loans to 10 cents, cutting the bonus to 2 cents, conformably.

The Kerr-Smith Act regulating the production of tobacco was held unconstitutional and void by a Federal District Court decision at Louisville (Judge Dawson) on April 13. Nevertheless the vote among tobacco-growers, as to extending the limitation of acreage in flue-cured tobacco through the AAA, was taken on June 29 and showed a sweeping majority in favor. A vote among growers of wheat, taken in May, favored continuing Federal control over the production of wheat, by about six to one out of some 250,000 ballots. Over 941,000 farmers voting October 26 approved by nearly seven to one renewed Federal control for 1936 over corn and swine. The AAA began lending on farmers' corn at 45 cents a bushel, October 30.

Secretary of Agriculture Wallace sought in December an authorization under the act of 1935 amending the AAA, to spend part of the Federal receipts from customs in buying surpluses of fruits and vegetables for distribution among the needy; but Comptroller-General McCarl denied the authorization, holding that a free distribution "would in no sense accomplish the purposes of the act." The AAA had taken over from the FERA, December 13, the Federal Surplus Relief Corporation. With regard to the use of relief money for the administration of the law of 1935 restricting the sale of potatoes, McCarl ruled on November 16 that this money could not be so applied.

The PWA's Activities. When the President set up in April a new organization to manage the expenditure of the \$4,000,000,000 that had been provided in order to shift the dependent idle from direct public assistance into paid occupation he preserved the PWA but did not make it the chief instrument in the new plan. It had not been able to promote and finance new undertakings within its field as fast as had been hoped. The difficulties that it encountered were due to several causes. Admin-

istrator Ickes had taken great pains to combat the entry of graft and politics in the use of money granted or advanced by his organization. Litigation had delayed the advance of projects for housing in cities and for electric development by local governing bodies; suits led to a Federal District Court decision on April 23 (Judge Watkins) at Greenville, South Carolina, that money from the PWA might not be used by Greenwood County to construct a power plant prejudicial to the property of the Duke Power Company, and a Federal Circuit Court decision on July 15 at Cincinnati, that the PWA could not condemn land on which it sought to erect housing for people of low income. Some \$740,000,000 allotted to Federal plans for housing was declared in September to await the Supreme Court's review of the latter case.

Many private companies selling electricity opposed the PWA in the courts in the same manner as the Duke Power Company, mentioned above. Many projects for municipal electrical plants, moreover, could not satisfy requirements set by the President, limiting the rate of yearly cost, for public works, to the number of persons employed. In Louisiana (q.v.) the passage, under the Long dictatorship, of laws hostile to the Federal policy caused the suspension of Federal aid for public works. Under the new programme of "work relief," furthermore, allotments favored by the PWA and payable out of the \$4,000,000,000 work-relief fund had to pass the inspection of an Advisory Committee on Allotments, separate from the PWA.

Congress had allowed the PWA to expend a great part of the four-billion dollar "work-relief" fund, in loans and grants toward the cost of approved projects for public works. There was no lack of applications for such grants. By September 11, those from 47 States numbered more than 10,000, called for the employment of nearly 1,600,000 persons, and reached a total proposed cost of \$2,646,075,504, of which the PWA was asked to grant outright \$1,144,735,840. But only a score or so of the projects in this class had reached the actual working stage; nearly 2000 others, favored by the PWA, had failed as yet to gain the approval of the Advisory Committee on Allotments; the rest had, for the most part, to pass the scrutiny of the PWA. The President thereupon decided to support Works Progress Administrator Hopkins in diverting to other forms of "work relief" the greater part of the PWA's intended grants of \$900,000,000. According to figures published on October 1 the PWA allotted only an approximate \$327,000,000 in grants, the rest of the fund being diverted from its disposal. Another fund, amounting to \$400,000,000, which the PWA was to expend on roads and the elimination of grade crossings, had as yet provided only \$13,762,000 in fully approved projects.

The PWA, before the setting up of the work-relief system, had lent much Federal money to finance divers sorts of construction; in return it had received the obligations of the borrowers. The President, by an executive order of June 8, authorized it to sell such securities directly, instead of acting through the Reconstruction Finance Corporation. It could thus in theory recover the money it had lent and lend this money again to finance additional loans of like sort. The President approved on June 21 an allotment of \$23,000,000, additional to the PWA's original \$15,000,000 allotment, for work on the Grand Coulee Dam in the Columbia River; studies were made as to the pos-

sible creation of a Columbia River Authority, similar to the TVA, for handling the Federal projects at Grand Coulee and Bonneville.

Rise of the WPA. The Works Progress Administration was the Federal Government's chief new experiment of 1935 in special organizations to cure economic ills. The President, by executive order of May 6, created this agency, rendering it "responsible to the President for the honest, efficient, speedy, and coordinated execution of the work-relief programme as a whole." It was also to recommend and carry on "small useful projects designed to assure a maximum of employment in all localities," and to help the President to prescribe as to the pay and the conditions of labor on projects. Harry L. Hopkins was made Administrator; he was already Administrator of the FERA and was retained in that post. His double capacity gave him control of both ends of the situation in shifting the unemployed from direct doles to remuneration for devised tasks. The same executive order created a Division of Applications, for receiving applications for allotments of work-relief money and for revising them; also, an Advisory Committee on Allotments, headed by Ickes, to recommend allotments to the President. The latter was to ratify these as he saw fit, but then it remained for the Comptroller-General to pass on the legitimacy of the proposed disbursement.

Since the whole plan of "work relief" looked to a prompt transfer of relief from the basis of donation to one of remuneration, the Hopkins influence became predominant. Many of the States had the greatest difficulty in raising the money required of them as a condition to their receiving aid from the FERA. They had reason to look forward eagerly to its being supplanted by "work relief." The dependent idle hoped to improve their living by the change. The Administration had let it be understood that it intended to shift to paid work 3,500,000 persons by November 1. As the progress toward this goal fell more and more behind schedule the WPA was more and more expected to find ways to carry matters forward. According to a news report of September 13 the President assigned to Administrator Hopkins the task of finding work through the winter for the then still unplaced two and a half millions of unemployed out of the 3,500,000 who were to get work by November 1.

The assignment of the "work-relief" appropriation, as stated at the beginning of October, included \$900,000,000 for the continuation of "direct relief" on a limited scale through the winter and \$600,000,000 for maintaining the Civilian Conservation Corps. Of the available \$3,425,000,000 that remained, \$1,150,000,000 had been assigned to the WPA's projects for devising work. Typical of the WPA's numerous projects, as they required little spending except for direct wages, were the hiring of professional writers to prepare a national guide book, the employment of musicians and actors to give performances, and the creation of athletic fields, golf courses, and other places of outdoor sport.

The President prescribed by executive order of May 20 a scale of wages to apply to all employment under the plan of "work relief." The recipients were put into four classes according to their types of work; types in turn were classified by regions, in correspondence with variations in the cost of living. The top pay was set at \$94 a month for professional people in New York City; the bottom, at \$19 a month for Southern unskilled farm

hands. The pay in corresponding grades was much below what the private employers in industry (as affected earlier through the NRA by the Government itself) were giving. The President intended both to make the available money employ 3,500,000 people and to pay them such low wages that they would quit Federal pay for private employment as soon as they could. Some of the people employed at Federal expense soon showed disappointment with their rewards. Unionized mechanics employed on WPA jobs in New York City started a strike at the beginning of August. General Hugh S. Johnson, former National Relief Administrator, who had been made head of the WPA's organization in New York, refused to treat with the strikers. The Administration took the view that one could not strike against the relief of one's economic distress. The State Federation of Labor took the strikers' part. As projects required a certain number of skilled workers, the protraction of the strike among the latter tended to hold back employment for other men, who wanted to work. The Government finally conceded on September 19, not a rise in the monthly pay of the strikers, but a reduction in their monthly hours to 80, from 120. A strike in Iowa was settled in August by granting increases in monthly pay. Later, as the number of positions under the WPA increased, there occurred some difficulty in obtaining necessary skilled workers for some projects.

FERA Superseded. According to data published on March 1 the FERA spent \$1,069,333,771 in the calendar year 1934 to dispense aid to the dependent unemployed in the 48 States. This came to 72.3 per cent of the total so spent; the remainder came from the governments of States and of communities within them. There was much discrepancy in the non-Federal percentage among the several States. It was less than one tenth of 1 per cent in Florida and more than 54 per cent in Rhode Island. The number of families and of single persons (not in families) receiving aid from the FERA remained well above 4,000,000 (as estimated) until May, when it was still put at 4,100,932. It fell more than seasonally to 3,830,871, as reckoned for June, and somewhat farther thereafter. The figures did not include the needy persons aided under rural rehabilitation, aid to students, and special aid to transients. The FERA announced the termination of its grants to States, for the support of the destitute, with the payments made at the end of November. Many then still depended on this aid, but much the greater part had been shifted to public works and the WPA. The FERA spent \$1,692,234,807 in 1935.

The number of individuals partaking in the support accorded to the approximately 4,000,000 direct recipients of early 1935 was undetermined. Some judged it to be about four times this figure, on the theory that the provider with a big family to support was the one soonest to become destitute from lack of work; this way of estimating would have put the dependents on the FERA early in the year at 16,000,000 or more. The number of all individuals dependent in whole or in part on the receipt of funds from the Federal "new deal" greatly exceeded that of the FERA's beneficiaries alone; for, not to count regular jobholders, it included 300,000 in the CCC, an unknown number engaged on works of construction either directly by the Government or under contractors, persons whose farms or homes were saved by the Federal refinancing of mortgages, artisans employed with money from loans obtained from the PWA, em-

ployees of railroads kept solvent by loans from the RFC, and the greater part of 6,000,000 farmers and their employees and dependents as recipients through the AAA, drought relief and seed loans. It seemed likely that one-third or more of the population was more or less dependent on money that had come from the Treasury or for which the Treasury was liable.

It was the intention in April, at the start of the scheme of "work relief," that created jobs should absorb the FERA's employables by mid-autumn. The most commonly alleged need for this change was that people of proper spirit preferred working to taking a dole. The consideration, less discussed, that dissatisfaction with the amounts given in money, provisions and the like had brought on some serious local disturbances, had its weight. Again, the cost of administering outright assistance to the needy was high; for all the States combined it was reported to have come to 9.9 per cent of the total expenditure of the FERA and the States' relief bodies for January; i.e., to nearly 11 per cent of what the beneficiaries received. The pay of some 163,000 relief workers, mainly engaged in examining the cases of need, formed the chief administrative expense.

The later allotments of funds to the FERA were made out of the work-relief total, starting with \$87,000,000 on September 13.

The FERA had difficulties with the governments of several of the States; it met with these either in bringing the States to bear a greater part of the cost of aiding the needy than the State authorities cared to undertake or else in stopping alleged abuses in the distribution of Federal aid by State organizations. Grants of Federal funds in some cases were cut off by Administrator Hopkins, or were reduced, where States had either not appropriated at all or had appropriated less than they seemingly could afford. The States thus pressed or threatened into paying more included Illinois, Pennsylvania, New Jersey, Minnesota, Idaho, and Washington. In Ohio, acting on allegations of corrupt political interference, the President ordered Administrator Hopkins to take over from State authorities the administration of aid.

Maintaining needy war veterans in camps was one of the special activities of the FERA. Many of the men in these camps, according to current accounts, had left their abodes to go to Washington, somewhat in the manner of the bonus army of 1932. Instead of letting them become numerous in Washington the Government offered them maintenance in special camps. It set up three such camps among the Florida Keys. The Labor Day hurricane swept over the keys, driving the sea many feet above the normal high tide. The camps were inundated. Of the 716 veterans that occupied them, 327 were lost and 138 were injured.

About 865 persons forming a group of families from Michigan, Wisconsin, and Minnesota were sent to Alaska in May, with an additional number of men having no fixed home. The FERA maintained them in tents while building houses in which to settle them as farming colonists at Matanuska in the autumn.

Expansion of the CCC. Heavier enrollment in the CCC formed one of the features of the scheme of "work relief." The maximum number to be enrolled was raised to 600,000. The progress toward that total, however, was slow. The camps had about 519,000 members at the end of August. In order to raise the enlistment the minimum age of eligibility was then lowered to 17 years. It was

asserted that many who might have gone to the camps were dissuaded by hope of getting work at home under the WPA. The members of the CCC were credited with having planted about one-half of 164,000,000 young trees set out in 1934 in National and State forests.

Bituminous Coal Control. The President appointed under the terms of the Guffey Coal Act of 1935, on September 20, the five members of the National Bituminous Coal Commission and the three members of the Bituminous Coal Labor Board. The new organization was acceptable both to the labor unions and to most of the operators in the Appalachian field. The two groups, which had been in disagreement for months, reached six days later an agreement, to run for 18 months, which was to provide substantial increases in pay to some 400,000 workers. The "captive" mines of the chief coke and steel companies in the Pittsburgh area were soon brought into the agreement. On the other hand operators in Southern fields held that they could not accept a code governing their business unless it should allow them very ample differentials below the rates of the better situated fields. A number of them brought suit for an injunction against the tax that the act laid on the production of non-complying mines.

Federal Home-Building and Resettlement. The Subsistence Homesteads Division had been created by the President under the terms of the Recovery Act of 1933. It was allowed to lapse on June 16 with the end of the term set for the application of that act. It had worked on only a small scale, relatively to that of other enterprises of the New Deal. It was credited with having finished or partly built, up to its termination, 1065 dwellings and with having started 27 "projects." Of the latter, that at Houston, Texas, was regarded as a success, while the better known one at Reedsville, W. Va., was thought by some likely to become a "company town" dependent on one industry.

The President created on May 1, as a part of the "work relief" organization, the Rural Resettlement Administration, and appointed Under-Secretary of Agriculture Tugwell Administrator. This agency was charged with carrying out projects to resettle "destitute and low-income families from rural and urban areas," to deal with erosion of the soil, reforestation, and flood-control, and to finance purchases of farms. It took over the undertakings of the Subsistence Homesteads Division and a certain amount of resettlement work from the FERA.

Unlike its predecessor, the new agency started on a great scale, with several thousand employees, largely field workers in rural resettlement and "land utilization." Plans for spending \$262,000,000 were formed by the end of September; they called for restocking and re-equipping some 350,000 farms, removing up to 50,000 farming families from poor land to good, reforesting abandoned land, and providing suburban dwellings for thousands living in cities. A suburban community of cottages and apartments was brought to the stage of construction in October, at Berwyn Heights, Maryland, near Washington. Many plans, however, were still incubating at the end of the year.

Renovation of Homes. The FHA was very active during the year in writing the Government's limited insurance of payment of owners' obligations incurred for the renovation of homes. About \$351,000,000 in mortgages had been insured and placed, chiefly with banks, from the start of the plan up to the middle of April; the insuring of such mortgages continued thereafter at the rate of

\$1,000,000 or more a day. The charge for the insurance was reduced in June to one-half of one per cent per annum for all types. The FHA began the extension of its system of insurance to mortgages for the construction of new apartment buildings of low cost.

The TVA in the Courts. A decision of a Federal District Court at Birmingham (Judge Grubb) held against the TVA on February 22, in the suit of stockholders of the Alabama Power Company, which contended that the Government had no right to sell electricity in competition with private business. The Circuit Court at New Orleans reversed this decision on July 17; the stockholders carried appeal to the Supreme Court. Meanwhile the plans of the TVA for selling electricity to the communities in its area progressed and work on unfinished plants for hydroelectric power went on. The Comptroller-General delivered in May a report of his audit of the TVA's affairs for 1934, in which he challenged some of its acts (See TENNESSEE).

Controlled Markets for Securities. The main operations of the SEC in 1935 had to do with bringing about the registration of both new and already outstanding issues of securities, as conforming with the requirements previously set up. Chairman Joseph P. Kennedy of the SEC had the confidence of the financial community and preserved it by issuing divers amendments to the requirements for registration, designed to render these less onerous to those responsible. It had been widely felt that the requirements tended to discourage new financing. However, the bulk of the important outstanding domestic issues on the exchanges proceeded to comply with requirements, the chief exceptions being some leading banks' stocks and the bonds of many foreign governments. Comparatively little was done in the way of issuing securities involving the subscription of new capital; but there began early in the year a series of conversions of callable bonds of domestic companies, designed to secure to such companies the advantage obtainable from abnormally low rates for loans; and the prevalence of conversions indicated that the lack of efforts to raise new capital did not proceed necessarily from the difficulty of registering new issues.

The exchanges for securities having already conformed to the rules of the SEC, the dealers "over the counter" were ordered on May 5 to register under rules made for their control. James M. Landis, one of the authors of the Securities Exchange Act of 1934, succeeded Kennedy on September 23 as chairman of the SEC. The commission published, beginning August 23, data that certain companies had furnished but wished kept secret, as to high salaries and other emoluments of companies' officials. The termination of trading on exchanges, in securities not fully listed, was deferred in May, to May 30, 1936.

The SEC failed, up to the end of 1935, to effect compliance with the Utility Holding Act on the part of the great majority of the companies directly affected. Only three of the leading companies filed registration with the SEC by December 1, as the act required. Though the act directed that recalcitrants should be excluded from the use of the mails, the Postmaster General suspended this exclusion by an order on December 4.

Federal Trade Commission Active. In addition to assuming the work of passing upon the so-called voluntary codes for industries, for which Congress had provided in its partial salvaging of the NRA, the Trade Commission issued a series

of reports on the property and methods of the electric utility companies. These reports, made to the Senate, followed investigation extended over some six years. Highly adverse as a whole to the companies, they appeared at the time when the Administration's scheme for putting such companies under Federal restraint was on its way to enactment. They put stress on the views that regulatory bodies in many States had through laxity permitted overvaluation of companies' properties; that the concentration of ownership in great and involved capital structures tended to carry the business beyond adequate State control; that in the chief 18 of these elaborate structures opportunities had been taken to augment the stated values of assets by over \$1,000,000,000; that some companies manipulated the prices of their own securities; and that it was a common practice to charge the domestic customer too much in proportion to the industrial customer's rates.

The Ordinary Administrative Activities. Many of the ordinary branches of the administrative government were occupied largely with the furtherance of the "New Deal." Thus the Treasury, as related above, found the needed means in excess of revenue by borrowing and by other means; it also reabsorbed the agency for suppressing illicit traffic in liquor, succeeding the defunct I'ACA. The Department of State was occupied to a great extent in negotiating for treaties to expand exports and imports under plans of reciprocity. The War Department took charge of many of the Federal projects of construction, particularly of the scheme for tidal generation of electricity in Passamaquoddy Bay and that for a canal across Florida. Plans for adding to the buildings at the Army bases and for further "mechanizing" the units of the regular army were prosecuted. The Navy undertook further substantial additions to its fleet by construction in its own and in private yards.

Foreign Affairs. A difference with Canada over the sinking, by a pursuing coast-guard vessel, of the Canadian liquor runner *I'm Alone* on the high seas in 1929 was settled; in accordance with the findings of a board of arbitration the Secretary of State sent an apology to Canada on January 21, and the United States paid damages of \$50,666.50.

Treaties for reciprocal concessions in tariffs were made with Belgium and Luxemburg on February 27 and later with Brazil, Haiti, and Colombia. An agreement with Canada for extensive reciprocal concessions to promote commerce was executed at Washington on November 15. See CANADA under *History*. George N. Peek, having resigned as the President's commercial adviser, came forward to oppose this treaty as a violation of the President's campaign pledge not to reduce tariffs on products of agriculture. Commercial agreements were also executed with Honduras (at Tegucigalpa December 18) and the Netherlands (December 20). Such treaties, under the terms of the Reciprocal Tariff Act of 1934, could be made effective, so far as the United States' share in ratifying them was concerned, by the simple ratification of the President.

Negotiations for a commercial treaty with Japan were carried on, with regard to sharing the market for textiles in the Philippine Islands. Efforts were made to negotiate a more favorable treatment of American goods under the French system of tariffs. George N. Peek, acting as the President's appointed "adviser on foreign trade," reported adversely to the Secretary of State Hull's

policy of negotiating for reciprocity in tariffs, holding that the United States' creditor position rendered reciprocity useless.

Panama having refused tender of the yearly payment of \$250,000 by the United States in devalued dollars in place of those stipulated in the treaty of 1903, negotiations with Panama were carried on, to settle the dispute. It was unofficially reported on August 15 that a treaty was likely to be concluded by which the right of the United States to intervene internally in Panama would be abandoned and the system of annual rental payments to Panama "readjusted" so that Panama should receive "in devalued dollars the equivalent of the contract stipulations for the past two years, with accrued interest." See PANAMA under *History*.

The President gave instructions to the Treasury on April 1 making three classes of countries with respect to United States tariffs; in cases of the first class (Canada, Netherlands, Spain, Switzerland, and Liechtenstein) duties proclaimed for Belgium and Luxemburg were to apply for six months; for the second class (Denmark, Germany, Italy, and Portugal) such duties were to apply until 30 days after the termination of a most-favored-nation agreement; for the third class, the majority of nations, the duties were to stand only until altered.

Relations with Russia took a diverse course. On January 31 Secretary of State Hull announced the abandonment of negotiations for settling the Russian debts to the Government of the United States and to its citizens. On July 13 was signed in Moscow a Russo-American trade agreement under the terms of the Reciprocal Tariff Act. On August 25 the Department of State, through Ambassador Bullitt at Moscow, complained of the attitude taken toward the United States by the congress of the Communist International and asserted that a Russian pledge against agitation in the United States had been violated thereby. The Russian government rejecting responsibility for the acts of the International, Hull issued a public statement impugning the Russian position and indicating a prospect of impaired relations with Russia.

The situation as to the war debts owed to the United States Government remained unchanged. Secretary Hull made an apology to the German government on September 14 for remarks uttered by Magistrate Brodsky of New York City in dealing with persons arrested in a disturbance on July 26 at the docking of the liner *Bremen*. A higher scale of tariffs was ordered on September 16 (applicable after October 15) on goods from Germany. The government of Liberia, with which relations had been broken in 1930, was again admitted to diplomatic relations, on June 11. With regard to the Italian invasion of Ethiopia, the Administration applied the provisions of the Neutrality Resolution of 1935, forbidding the export of arms and kindred goods either to Italy or to the invaded country. A lease of rights to exploit for petroleum a field in Ethiopia having been acquired by the Standard-Vacuum Oil Company shortly before, the Department of State influenced the company to agree to abandon the concession on September 3, in view of the complications caused by the course of the Italian government. Though active in naval construction, the Administration retained the policy of favoring the limitation of naval forces by international agreements; the President sent a delegation of three to attend the naval conference that convened at London on December 6, to discuss the extension of agreements of this sort, which

were soon to reach the end of their term. See *NAVAL PROGRESS*; *JAPAN* under *History*.

The Army. Maj-Gen. Malin D. Craig became Chief of Staff on October 5, succeeding Major-General MacArthur, retired, who went to the Philippine Islands to organize a military force for the new government there. See *MILITARY PROGRESS*; *PHILIPPINES* under *History*.

The Navy. The naval dirigible airship *Macon*, meeting the fate of the *Akron* and other great airships, collapsed while over the ocean off the coast of California on February 12. All but two of the men aboard her were rescued. (See *AERONAUTICS*.) Under a plan of naval construction calling for 24 new war ships of various types, for which Congress had provided, bids were obtained from private yards for the building of 13 vessels. See *NAVAL PROGRESS*.

Higher Expenditures on Veterans. Retrenchment in expenditures of some sorts, for the benefit of veterans, through the Veterans' Administration had been enacted in the earlier days of the Roosevelt Administration. But grants were gradually restored in a number of directions. Consequently the expenditure upon veterans for the fiscal year ended with June 30, 1935, rose from an originally proposed \$546,505,891 to a final total somewhat above \$660,000,000. On April 30, 375,215 veterans of the World War and 102,119 dependents of such veterans were receiving monthly compensation. An act signed August 12, to operate from that date, restored current payments to certain of the veterans of the Spanish-American War, Philippine Insurrection, and Boxer Rebellion—but the sum (nearly \$40,000,000) needed for these payments in the then-current fiscal year was not appropriated.

There occurred early in the year a considerable renewed movement of needy veterans of the World War into Washington. They were removed into special camps in South Carolina and Florida (see section on the *FERA*, above).

The Postal Service. The limitation of the working time of postal employees to 40 hours a week was established. It was alleged in the House of Representatives and elsewhere that Postmaster-General Farley, procuring at their face value special sheets of stamps of distinctive character and consequent value to collectors, had made gifts of these to his friends. Collectors, who felt aggrieved, were later conciliated by permission to buy unperforated and ungummed sheets or parts of sheets of some twenty special issues at face value. About \$1,664,000 in such stamps was sold in the course of three months.

Relations with the Dependencies. A popular vote taken in the Philippine Islands (q.v.) on May 14 gave a heavy majority in favor of the constitution that had been drawn up, for a government of the Islands during an autonomous period of 10 years to precede their independence. President Roosevelt had signed this constitution on March 23. The organization of the new Philippine government proceeded, after its adoption by popular vote. See *PHILIPPINES* under *History*.

Governor Paul M. Pearson of the Virgin Islands resigned the post to accept a position in the PWA. He was succeeded in July by Lawrence W. Cramer, advanced from the post of Lieutenant-Governor of St. Croix. Pearson, as Governor, had met with opposition from part of the population of the Islands and had had differences with Paul Yates, administrative assistant, who after being discharged carried complaints to Washington in April. Yates's activities were followed by an in-

vestigation ordered by the Senate, which reported nothing to Pearson's discredit. See *HAWAII*, *PUERTO RICO*, and *VIRGIN ISLANDS* under *History*.

Relations with the Railroads. The Interstate Commerce Commission rejected on March 30 an application of the Class-I railroads for a general increase of 10 per cent in freight rates, intended to raise their revenues by some \$170,000,000 yearly; it granted temporary surcharges, applicable until June 30, 1936, on carload traffic, designed to raise revenue by \$85,000,000. The Supreme Court in a decision of May 6 held the Railroad Retirement Act of 1934 unconstitutional (See *JUDICIARY*, below). This ended the effort to put the act into operation. Coordinator of Transportation Eastman in an address to the Railway Labor Executives Association on January 12 warned that the railroad unions' demand for a six-hour day would wreck the railways; but the unions' executives stated that they would nevertheless continue efforts to gain a six-hour day through Federal legislation. Eastman announced on August 1 that an investigation of pay in the railroads' employ in 1933 had shown 15 per cent of the employees to have been receiving 35 cents an hour or less. The Chicago and Northwestern and St. Paul systems were among those to enter bankruptcy under Section 77 of the amended Bankruptcy Law. See *RAILWAYS*.

Boulder Dam Finished. Boulder Dam, an enterprise begun in 1930 under the Hoover Administration, was completed by February 1 to such a point that the gate barring the passage of the main current of the Colorado River could be shut. The lake above the dam rising slowly, attained a length of some 84 miles, a depth at the dam of 286 feet, and about one-seventh of its full volume of water by July 21. President Roosevelt dedicated the dam on September 30. The hydro-electric generating plant at the dam was brought near to completion. Construction of a \$220,000,000 aqueduct by the cities of southern California to bring water from the river to the Pacific coast, over a distance of 259 miles, made progress. The building of the dam itself was performed by a contracting firm. The cost of the dam and hydro-electric plant was stated by the President in his dedication as \$108,000,000, which the Government expected to defray gradually, with interest, out of the sale of electricity.

Events Bearing on the Constitution. The Legislatures of four more States, in the regular legislative sessions of the early months of the year, voted ratification of the proposed Child-Labor amendment to the United States Constitution. This brought the number of ratifications up to 24, or one-half of the number of all the States. However, 16 States' Legislatures, in the three months ended with March, refused to ratify. The ratifying States of 1935 were Idaho, Indiana, Utah, and Wyoming.

Remarks made by the President to the press, in his commenting on the Supreme Court's overthrow of the NRA, were widely taken to signify that he favored altering the Constitution in favor of the "New Deal." Several proposals of amendments to remove or lessen the court's power to invalidate acts of Congress, or to extend the Federal powers, were introduced in Congress. Some of the supporters of the Administration, notably Senator Norris of Nebraska and Governor Earle of Pennsylvania, came out to urge Constitutional amendment. Senator Borah, in a public speech by radio delivered on June 2, defended the sufficiency of the Constitution in its actual form and attacked

the impulse to amend in haste. Many Republican leaders and organizations declared against sweeping amendments to promote new theories of government. On the other hand, at the convention of the American Federation of Labor in October, an effort to commit the Federation to the support of a proposal to amend the Constitution so as to allow freer legislation for the benefit of the labor interest received strong backing.

CONGRESS

Only one session of Congress was held: the first regular session of the Seventy-fourth Congress. It convened on January 3 and adjourned on August 26. Its exceptional duration, eight months less one week, exceeded that of any previous session of Congress during the Roosevelt Administration. Although the Democrats had a sweeping preponderance in both houses, differences within the majority occasioned long delays in business; the session was further protracted by the need, arising at the end of May, for enactments to cover the situation brought about by the Supreme Court's invalidating the NRA; and about the time when the session had hoped to adjourn, the President, under considerable pressure from radical advocates of the redistribution of wealth, presented recommendations calling for taxes calculated to dissipate great fortunes and handicap great corporations. The Seventy-fourth Congress was the first to start its term in January under the Twentieth Amendment.

Composition and Organization. The Senate was composed of 69 Democrats, 25 Republicans, 1 Farmer-Labor member and 1 Progressive. But the Sixty-ninth Democrat, Rush D. Holt of West Virginia, elected though not of the qualifying age, was admitted only on attaining the age of 30 years in June. Senator Bronson Cutting (q.v.) of New Mexico, Republican, died in the wreck of an aeroplane on May 6, and Dennis Chavez, who had been his Democratic opponent in the election of 1934 and had contested the seating of Cutting, succeeded to the seat by appointment *pro tempore*.

The House, as assembled, held 322 Democrats, 102 Republicans, 7 Progressives, and 3 Farmer-Laborites; there was one vacancy. The Republicans, even to include those of progressive tendencies, could muster only about one-fourth of either house.

Joseph W. Byrns of Tennessee was elected Speaker of the House of Representatives; William B. Bankhead of Alabama was chosen majority leader in the House; in the Senate, Robinson of Arkansas was retained as majority leader. The Republicans chose as leaders McNary of Oregon in the Senate and Snell of New York in the House. The rule that the House had adopted in 1931 when the Democrats first took control, to require a committee to release any bill for the House's consideration when 145 members should so demand, was changed on January 3, by vote of the Democrats. It was made necessary for a majority to demand a bill in order to bring it out of committee against the committee's will. This latest change favored control over legislation by the central group of the majority, in touch with the Administration, just as the rule of 1931 had worked to weaken the legislative influence of the Republican Administration.

Chief Bills Before the Session. An unusually great number of measures for the advantage of employees, unionized or other, were enacted. These included the Wagner-Connery Labor Relations Act, the Guffey-Snyder Bituminous Coal Control

Act, the Wagner Social Security Act, the McKellar-Mead 40-Hour Postal Act, the Wagner-Crosser Railroad Retirement Act, the Summers-Ashurst Act limiting commerce in prison-made goods, the Bland Act requiring ships to have crews two-thirds composed of citizens in order to hold mail contracts, and the NRA Extension Act. The chief enactments for the farming interest were: the AAA Amendment Act, the Farm Credit Act, the Frazier-Lemke Farm Mortgage Act, the Rice Amendment Act, and the Tobacco Inspection Act.

Measures to strengthen the Federal control over divers kinds of commerce included: the Air Mail Act, Banking Act, Federal Alcohol Control Act, and Petroleum Act. Measures affecting the Federal undertakings for the welfare of the social masses, other than the laboring and farming groups, included the Work Relief Act and the Tennessee Valley Act. In the field of taxation were passed a Wealth-Taxing Act, a measure extending the duration of the so-called nuisance taxes, and one repealing general publicity for the incomes of persons paying the income tax. Measures affecting Federal debt were a Gold Clause Act, withdrawing the Government's consent to be sued in cases arising from the abrogation of its undertaking to pay gold, and an act increasing the allowable maximum of outstanding Federal public debt to \$45,000,000,000.

A Neutrality Act was passed to require and regulate neutrality in foreign wars. Congress also extended the life of the RFC, the office of Coordinator of Transportation, and the Emergency Railroad Transportation Act of 1933. It aided debtors not only by the Frazier-Lemke Act but by a Home Mortgage Relief Act (rendering the Home Loan Bank Act more liberal) and a Railroad Reorganization Act. It passed, but the President vetoed, a bill for immediate payment of the soldiers' bonus. It failed to pass, of the chief measures sought by the Administration, the Walsh bill to require observation of the invalidated NRA codes in the performing of contracts with the Government; a bill to substitute, for the so-called mail contracts, outright subsidies to shipping; a measure to regulate exchanges dealing in commodities; the proposed adherence to the World Court; the Third Deficiency bill (carrying appropriations for divers agencies of the Government); and a bill to strengthen the Food and Drug Act. Salient particulars as to leading legislation appear below.

Social Security Act. This act was signed by the President on August 14. Its primary objects were two: to provide for establishing, in cooperation with each of the States, systems in the States for the payment of support to the needy aged and to pay sums to persons during limited periods after their losing employment; provision was also made for Federal aid towards States' aid to needy dependent children, States' care for mothers and their children, for crippled children, for neglected children, for the vocational rehabilitation of the disabled, for health-service agencies, and for the blind. The purpose as to old-age pensions was to be effected in the first place by the Government's matching States' allowances to needy persons over the age of 65 years, up to \$15 a month for each case. Independently, a special income tax on employees and a tax at an equal rate on the payrolls of employers was to be levied, starting in 1937 at 1 per cent and rising by steps to 3 per cent in 1949, to provide a permanent fund out of which, not before January 1, 1942, qualified employees retiring at 65 would receive to the end of life payments at

from \$10 to \$85 a month. States seeking Federal aid for their pension plans must conform, as to these, with requirements that the act set up. To help States pay allowances to persons losing employment, the act created a separate tax of 1 per cent the first year, 2 the second and 3 thereafter, on employers' payrolls, starting with the payrolls of 1936. Out of a fund built up from the proceeds of this tax and invested by the Treasury in Federal obligations, States that conformed with stipulated requirements were to receive aid toward their payments to the unemployed. Employers paying into a compulsory State fund for providing allowances to the unemployed were to receive Federal credit therefor, at the rate of 90 per cent. The Government was thus to distribute up to \$90,000,000 a year after 1936.

The bill was introduced on January 17 and strongly recommended in a Presidential message. In the House it was the target of advocates of more sweeping redistribution of usufruct, particularly supporters of the Townsend plan for high old-age pensions, who sought to implant their scheme in the bill. This effort failed. But the House made extensive amendments, in one of them removing the system's proposed controlling board from the Department of Labor. The Senate discarded this and other amendments from the House. It then adopted an amendment from Senator Clark to permit alternative voluntary industrial pension systems after the Wisconsin practice. The bill in this form went to conference. Obligated to abandon the House's amendments the House's conferees rejected the Clark amendment, which originators of the bill held incompatible. There followed a deadlock through July and the first days of August, but the Senate finally ceded, and the act went to the President on August 9. It differed from its original form in having been shorn of a provision for allowing workers, through the Government, to buy annuities for their latter years, at higher rates of payment, to them, than those in the contributory pension plan. The law was attacked in some quarters as creating what would in effect be a heavy sales tax.

Guffey-Snyder Bituminous Coal Stabilization Act. This act was signed on August 30, after having been urged through Congress by the influence of the Administration, which wanted operators of bituminous coal mines in the Appalachian area to come to an agreement for a new term with their organized employees, who threatened a strike. In a letter to Hill of the House's committee on ways and means, heading a subcommittee then considering the measure, the President wrote on July 5: "I hope your committee will not permit doubts as to the constitutionality, however reasonable, to block the suggested legislation." The provisions of the act followed in great part those of the bituminous-coal code that had been set up under the later-invalidated NRA. A National Bituminous Coal Commission was created and was required to administer the act and, particularly, to establish a code for the industry, embodying mandatory features detailed in the law. These included price-fixing provisions and a reenactment of Section 7-b of the Recovery Act, obliging the employers to accept labor organizations and negotiate with representatives of their employees' "own choosing." A Bituminous Coal Labor Board was created, to oversee labor relations, adjudge disputes and mediate. A tax of 15 per cent on the selling price or market value of soft coal produced was imposed on producers, but was remitted to the extent of nine-tenths

in the cases of producers filing acceptance of the code; thus producers had nominal liberty to stay out but must pay heavily if they did not conform.

Wagner-Connelly Labor Relations Act. Signed July 5, this measure was designed to satisfy the complaints of labor organizations against the provisions of the Recovery Act of 1933 as it affected them and also remedy their disappointment at losing the advantage of these provisions by the invalidation of that act. Enacted with the Administration's consistent support, the measure declared a policy of the United States to encourage collective bargaining and protect employees' freedom of self-organization, and their negotiating as to their employment through representatives of their own choosing. A new National Labor Relations Board was created, to consist of three members appointed for staggered five-year terms by the President with the approval of the Senate, removable only for "neglect of duty or malfeasance in office"; the board was charged to report yearly to Congress as well as to the President. The apparent effect was to substitute for the previous boards (serving largely at the executive pleasure) a body independent of other branches of the Government. A representative "designated or selected for the purposes of collective bargaining by the majority of the employees" in an employing unit was to be the exclusive representative of all the employees; the said "unit" might be "the employer unit, plant unit, or any subdivision thereof," and the board was to decide which unit should be adopted, "in each case." It rested with the board to stop any of an enumerated list of "unfair practices" (on the part of employers). It was empowered to ask any Federal court of appeals to enforce its orders; it could issue subpoenas for witnesses and the production of evidence. Nothing in the act was to interfere with "the right to strike."

Resolution Extending the NRA. As signed on June 14, this resolution extended the existence of the NRA until Apr. 1, 1936, or till terminated by earlier Presidential order; but merely as a much-reduced agency to be occupied largely with collecting the data as to the operations of the original NRA. Thus the name and part of the staff were kept in being, as of possible use in case any way should come for restoring some of the authority provided in the original plan. The delegation of power to the President, in the act of 1933, to prescribe or approve codes and to enforce them on groups engaged in the several kinds of commerce was repealed. For such of these groups as should voluntarily, through specified process and Federal agencies, bind themselves to codes preserving the main requirements of the old NRA codes as to employees and as to competitive practices, the provisions of the act of 1933 granting immunity from contrary features of the anti-trust laws were extended.

Prior to the Supreme Court's decision against the NRA, the chances of the passage of legislation, then pending, to extend the old act beyond its date of expiration (June 16) had been in some doubt. The Senate adopted on May 14 a provision for extending the old act only 10 months, and the NRA's critics in the Senate threatened to filibuster until the old act expired unless House and Administration yielded.

Wagner-Crosser Railroad Retirement Act. Signed August 29. Passed at the close of the session, this measure endeavored to accomplish with better regard to constitutionality the main purpose of the Railroad Retirement Act of 1934, which the

Supreme Court had overthrown. The new act created annuities for railroads' employees retired at the age of 65, to start with the date of the act's going into effect, Mar. 1, 1936; the annuities were to be payable out of the Treasury. An independent Railroad Retirement Board was created, to administer the act and to make a special report within four years on desirable changes in the system. A special investigating commission (3 Senators, 3 Representatives, 3 Presidential appointees) was provided, to recommend a system for the retirement of railroads' employees to Congress on Jan. 1, 1936. The imposition of taxes on the railroads and on their employees, to provide the money for paying the annuities, was left to a separate bill.

Agricultural Adjustment Act of 1935. Signed August 24. This measure amended the original Agricultural Adjustment Act in such wise as seemed likely to protect it from going the way of the NRA as unconstitutional. This was done by obviating previous apparent delegations of the legislative power, restricting the control over agriculture to the field of interstate and foreign commerce, and giving legislative ratification to prior acts of the AAA which might otherwise be considered to invade the legislative field. Subsequent suits for injunctions in the Federal courts, to halt the collection of processing taxes, were prohibited; suits to recover processing taxes already paid were limited to claimants who should previously present proof that no part of such payment had been shifted to the grower or to the purchaser of the processed goods.

Apart from these provisions concerned solely with the court room, the measure contained features of broader application. It authorized a plan for promoting the storage of grain and like non-perishable farm products by the farmer—a scheme known by its advocates as the "ever-normal-granary plan," involving loans on crops stored on the farm. Quotas for foreign agricultural products were authorized in cases where such products threatened to harm the prices for the domestic articles. The old scheme of "export debentures" was echoed in a provision allowing the diversion of 30 per cent of the yearly duties on imports into subsidies for the exportation of domestic farm products. The fixing of prices was abandoned except in the case of milk. The methods of enforcing marketing agreements were altered, by doing away with the licensing system for handlers and granting direct administrative power to compel observance of such agreements.

The Senate inserted into the measure, and the House accepted with slight alteration, an ambitious scheme for control over the production of potatoes, which did not have the backing (as did the original bill) of the Administration. The act as signed included this provision. It required the Secretary of Agriculture to determine what commercial crop of white potatoes would cause the sales to the growers an income equal in purchasing power to that of the years 1919-29; he was then to allot the determined quantity among the States. Tax-exempting stamps were to be issued to farmers up to allotted quantities; potatoes sold in excess of those covered by these stamps were to bear internal revenue stamps at the rate of three-fourths of a cent a pound. Not only sellers but also buyers were made liable to imprisonment and fine up to \$1000 for buying unstamped potatoes. The failure of Congress to appropriate for the administration of potato control left the plan without financial support. It was to apply first to the crop of 1936.

Farm Credit Act. Signed June 3. This act rendered more liberal the loans that the Land

Bank Commissioners might make to farmers by earlier enactment. They were allowed to lend upon liens (first or second) upon real property for terms up to 43 years. The time in which such loans might be granted was extended until Feb. 1, 1940, the limit of \$600,000,000 on the aggregate was removed from the bonds of the Federal Farm Mortgage Corporation, issuable against such loans, the purposes for which the Land Bank Commissioners' loans could be made were expanded to coincide with the purposes for which loans from the Federal Land Banks were allowed, the rates of interest on the loans of the latter banks were reduced to 3½ per cent for a year, starting with July 1, 1935, and 4 per cent for two years thereafter, and the Federal Intermediate Credit banks were allowed to issue consolidated debentures in substantially the same manner as the Federal Land Banks.

Frazier-Lemke Farm Mortgage Act. Signed August 29. The act was designed to mend the previous Frazier-Lemke Act, which the Supreme Court had found unconstitutional. The new act allowed a farmer unable to obtain composition or extension on his mortgage, or dissatisfied with the creditor's offer, to apply to a court, that it judge him bankrupt but allow him to retain possession of his property under the court's supervision and control. The courts were authorized to grant such a petition for the duration of three years and to stay proceedings against the farmer debtor for that time. The bankrupt was to be required to pay the court a "reasonable" rental. Out of this the court was to pay taxes in the first place and next, but still before the creditors, the cost of upkeep. An appraisal having been made of the property within the three years, the debtor was to be allowed to regain full title and discharge incumbrance by paying either the appraised sum or the debt, whichever was the smaller. Alternatively, if the court should put the property at auction on the request of a creditor, the mortgagor might redeem it in 90 days after sale by paying the purchaser's price and interest at 5 per cent.

Soil Erosion Act. Signed April 27. Though it drew little attention when passed, this measure provided the rudiments of a system under which Congress might find it possible later to restore Federal restrictions upon cultivation of the soil, in case that the AAA should be overthrown in the court. See SOILS.

Emergency Relief Appropriation Act of 1935 ("Work Relief"). Signed April 8. This was one of the earliest of the session's leading measures. "In order to provide relief and work-relief and to increase employment by providing for useful projects," it appropriated \$4,000,000,000 to be used, nominally, at the President's discretion. It further appropriated unexpended balances of several earlier appropriations (aggregating, as commonly estimated, \$880,000,000) for the President's use to the same purpose, but with certain limitations. The President's "discretion" in dispensing the entire sum was restricted thus: not over \$800,000,000 of the total was to be spent for highways, streets, and the elimination of grade crossings; \$500,000,000 for rural rehabilitation, aid to sufferers in "stricken agricultural areas," conserving water, diverting it through mountains, irrigation, and reclamation; \$100,000,000 for rural electrification; \$450,000,000 for housing; \$300,000,000 to aid persons in the educational, professional, and clerical classes; \$600,000,000 for the CCC; \$900,000,000 for loans and grants to States, Territories, possessions, and their subdivisions, for projects, and to their public bodies for self-liquidating projects, where at least 20 per

cent of the loan or grant would be spent for work; \$350,000,000 for sanitation, prevention of erosion of the soil, or of the pollution of streams or of erosion of the seacoast, reforestation, forestation, control of floods, work on rivers and harbors, and miscellaneous undertakings. The President, however, was left at liberty to increase any of these maxima by 20 per cent. No part of the sums appropriated in the resolution was to be spent for munitions, war ships, or military or naval material. Appropriations were to remain available until June 30, 1937.

The original bill, as supported by the Administration, was introduced in the House on January 21; it bore recommendations occupying a great part of the annual message (January 4) of the President, in which he stated the object of putting 3,500,000 needy persons to work, and so superseding the doles of the FERA. As introduced, it did not put the maximum allotments on the eight classes of work set in the final act. Rushed through the House with little change on January 24, it encountered difficulties in the Senate. There it acquired the restrictions put on the President's discretion by the maximum allotments to classes of work. The influence of the A. F. of L. was exerted, to the result that the Senate voted an amendment requiring the payment of "prevailing wages" in divers types of work to be provided under the plan; the Senate in a later vote rescinded this action. It also rejected amendments greatly to increase the appropriation and greatly to reduce it.

Tennessee Valley Authority Amending Act. Signed August 31. The act had for its most significant feature the explicit granting of power to the TVA to sell its surplus of electricity generated, over the quantity needed for Federal use; this power had been denied to exist in the TVA, by a Federal Court, in suit for an injunction. The act rendered it legal to sell to States, counties, municipalities, and non-profit-seeking organizations within transmitting range. The construction of the projected Norris, Wheeler, and Pickwick Landing Dams was affirmed to be necessary in the development of the Tennessee River for navigation, control of floods and production of electricity; and construction of other dams to the same purpose, such as would provide a 9-foot channel from Knoxville down, was authorized. The TVA was permitted to regulate rates at which its electricity should be resold. It was allowed to acquire existing facilities for serving farms and villages. The Comptroller-General was restricted in making his reports on audits of the TVA; that body was to have time to "examine the exceptions and criticisms" in his reports and make rejoinder before reports became public.

The passage of this measure involved conflict, in the House's committee on military affairs, to which the bill had been committed. A report of the Comptroller-General, considered by the committee, indicated that the TVA had not conformed with regular practice in computing depreciation, but had set this charge at an unduly low ratio to its plant. The matter was vital, as it bore on the question whether the TVA would, and should, sell electricity below cost. The committee was unable to give even a bare majority to the bill wanted by the Administration and passed by the Senate; it therefore reported a bill (by vote of 13 to 12) that accorded the power to sell electricity but put the TVA under restrictions in several other respects. The House later, by amendments, restored the measure substantially to its original shape.

Banking Act. Signed August 23. This act made fundamental changes with regard to the Federal Reserve Board, allowed National banks to make to limited aggregates first mortgage loans on real estate to run five years, and rendered permanent the FDIC's previously temporary system of insuring deposits in banks up to a maximum of \$5000 a deposit. In place of the existing Federal Reserve Board was substituted a Board of Governors of the Federal Reserve System. The Secretary of the Treasury and the Comptroller of the Currency were to be dropped from membership in the new board on Feb. 1, 1936. Its seven members were to be appointed by the President, to serve 14 years, at salaries of \$15,000 a year. The existing governors of the several Federal Reserve banks, who were not the governors in the new agency, were to be renamed presidents. The seven members of the new board and five annually and regionally elected representatives of the 12 Reserve banks were to form, from Mar. 1, 1936, a Federal Open Market Committee having power to direct the purchase and sale of Federal obligations in the open market, through the Reserve banks, which were obliged to follow the committee's orders as to such transactions. The new board was not empowered to lower the existing ratio of reserves to deposits, for the several classes of banks, of 7, 10, and 13 per cent, but it was allowed to raise them to double these figures.

The issue of the composition of the Federal Open Market Committee and its power to inflate or deflate credit through dealings in the Government's securities was fought out in the Senate's committee on banking. The House had passed a measure giving such power to the new board directly, thus rendering control of credit subject to Presidential influence in a high degree. Glass of Virginia, heading a subcommittee, was largely instrumental in causing the board to share its power of buying and selling in the open market with representatives of the Reserve banks and in lengthening the terms of the board's members sufficiently to render them less sensitive to executive pressure. The bill also provided that the Treasury might extend credit to the FDIC in case of need and that member banks might again underwrite issues of securities, to a limited extent; it forbade a banker's serving on the boards of more than two banks.

Petroleum Act. Signed February 22. Designed to fortify States' proration of the production of petroleum in their territory, this act prohibited the transportation of contraband petroleum from the State of its origin, on pain of confiscation. The President was permitted to raise the prohibition whenever he should find the supply of petroleum and its products insufficient for the demand.

Motor Carrier Act. Signed August 9. Desired by the Administration, this measure extended over the motor vehicles engaged as carriers in interstate commerce a form of Federal control similar to that long exercised over the railroads. Such vehicles, except those transporting exclusively livestock, fish, agricultural commodities, or newspapers, were subjected to the authority of the Interstate Commerce Commission, to start with any date within six months from October 1 that the Commission might set. Certificates of convenience and necessity were to be requisite to operation. The act required that reasonable rates of charge be maintained, subject to regulation. Finances of carriers were subject to regulation, as to mergers, securities, and reports; labor was likewise to be regulated.

Air Mail Act. Signed August 14. This act dealt further with the requirements of the situation of

the carriers of mail by aeroplane under Federal contract, as left after the Postmaster-General's cancellation of contracts in 1934. It retained the maximum rates that the act of 1934 had fixed for carriers, but it assigned the work of determining "fair and reasonable" rates to the Interstate Commerce Commission. The power to cancel contracts also was vested in the Commission. This body was directed to report to Congress by Jan. 15, 1936, whether fair rates on certain lines would exceed the statutory maximum. Limits of route mileage and of aeroplane mileage were increased, the initial periods of carrying contracts raised to three years, from one year, the number of primary routes made "at least three," instead of four, and a minimum of 750 miles was set for a primary route.

Alcohol Control Act. Signed August 29. The administration of Federal control over commerce in alcoholic beverages was transferred from the old FACA to a new Federal Alcohol Administration, headed by a single Administrator and forming a division of the Treasury Department; this was against the design of the President's advisers, who had by report sought the creation of a board of several men, at least partly independent of the Treasury. The Act further rendered it unlawful to make bulk sales of liquor to the general public and set a gallon as the greatest unit of containers allowable in such sales. This restriction had for its purpose the checking of improper bottling and branding. The importation, distillation, production, blending, and bottling, as well as the wholesale purchase, of alcoholic beverages, was restricted to holders of Federal permits. The act thus replaced the system of codes, invalidated by the NRA decision, with a new scheme of control based on divers clauses of the Constitution.

Public Utility Holding Company Act. Signed August 26. This act had as its purposes: (1) doing away with holding companies among the public-utility enterprises serving communities with electricity and other products, except where such companies might be needful; (2) regulating the operations of remaining holding companies and their relations with the subsidiary companies that they controlled. The Federal Power Commission was made the administrative agency for these purposes. It was charged to proceed after Jan. 1, 1938, to limit each holding-company system to "a single, integrated public-utility system," save for minor and appropriate transgressions of the exact limit.

However, it was to make exceptions in favor of a holding company's plural system or systems if these would suffer loss of economics by reason of segregation, if systems were all in one State or in adjoining States, and where the combination of systems was not too great to admit of localized management, efficiency of operation, and effective regulation. The commission was required, further, to terminate the holding, by a holding company, of control of a company that itself held the stock of a holding company—thus intently reducing the number of superimposed stages in the structure of systems. Holding companies were required to be registered, to file reports, and to follow the Commission's rules as to accounts, costs, competitive bidding for purchases, and disclosure of interest.

The issue of the "death sentence," as the provision for the breaking-up of holding companies was generally called, produced a conflict that persisted almost throughout the session. Interests identified with some public-utility systems brought pressure to bear early in the session, with a view to defeating the bill. The measure's supporters were

headed by the President, who sent a message to Congress on the subject on March 12, denouncing the criticized holding companies as "private empires within the Nation" and their efforts to check Congress as lobbying. Making no outright denial of the right of the citizen to seek the ear of the legislator, the friends of the measure promoted an investigation of the "utility lobby" through a special committee of the Senate. This committee occupied itself largely with the Associated Gas and Electric Company and with Howard C. Hopson, that company's controlling personality. A former manager of a telegraph office at Warren, Pa., testified that telegrams of protest against the bill had been sent in great number and signed with names taken from a local telephone directory; the originals of such telegrams had been destroyed. An employee of a subsidiary of the Associated Gas and Electric Company at Erie, Pa., testified that he had received orders to destroy pertinent records at the outset of the investigation. The Treasury, by order of the President, opened its records of personal incomes for the use of the investigating committee. It was reported that the Senate's committee had found record of \$700,000 expended by the Associated system to oppose the bill and of \$300,000 spent to the same end by the Committee of Public Utility Executives. While the disclosures of the Senate's investigators related to but a comparatively small number of companies, they tended to render the Capitol adverse to representations from the utilities' friends. The House, however, remained opposed to the Senate's more radical version of the "death sentence." The bill as ultimately enacted was a compromise between the two chambers.

Wealth-Tax Act. Signed August 30. This act was the response of Congress to the recommendation made by the President in his special message of June 19 that the Federal power of taxation be used as a weapon against "unjust concentration of wealth and economic power." The measure increased the surtaxes on individual yearly incomes of \$50,000 and over that had been set by the Revenue Act of 1934. The new rates ran, by a scale, from 31 per cent on the immediate excess of net income over \$50,000 to 75 per cent on excess over \$5,000,000. The income taxes on corporations were lowered for small incomes and were set at 14 per cent on income between \$15,000 and \$40,000, and at 15 per cent on income in excess of \$50,000. Limited deductions from a corporation's taxable income were allowed for contributions to charity. Taxes on corporations' excess-profits were imposed at 6 per cent of excess over 10 per cent of declared value and rose to 12 per cent of excess over 15 per cent of declared value. The tax on decedents' estates was set at 2 per cent on a net estate of \$10,000 and by a series of rises in the rate on the marginal amount, took 26 per cent of the initial margin over \$600,000, 50 per cent of that over \$4,000,000, and so on, to 70 per cent of all excess over \$50,000,000. The tax on gifts was elevated conformably, to three-fourths of that on estates. The tax on capital stock was increased in conformity with that on excess-profits. Holding companies for large fortunes were more heavily taxed and exemption from income tax on dividends from company to company was restricted. The act did not tax inheritances, as the President had intended.

An effort was made by the Administration's chief supporters in Congress to rush a wealth-taxing measure through as a rider to the bill prolonging the "nuisance taxes," which were deemed necessary

and which were to expire June 30; but this move lacked support. In the end the measure was considered separately and with some approach to deliberation. It covered the main points of the President's recommendations, except for inheritance taxes (taxes on the recipients of estates or portions thereof). The House voted such taxes but the Senate voted higher taxation of decedents' estates instead, and the Senate prevailed on this point. All legislative action on the bill was taken amid the political situation brought about by the manifestations of popular approval of Huey Long's agitation for the distribution of wealth.

Repeal of Income-Tax Publicity. A joint resolution passed in April repealed the requirement of the Revenue Act of 1934 that individuals' statements of income must be open, as to certain main points (declared with the return, on a special "pink slip"), to public scrutiny. The resolution provided, however, that the information should be available to the taxing authorities of States, on request from the Governors of the respective States.

Doughton Debt-Limiting Act. Signed February 4. This act served two main purposes: (1) to increase the permissible total of Federal bonds that might be outstanding at one time; (2) to limit the permissible total of Federal shorter-term paper. The Secretary of the Treasury was allowed, with the approval of the President, to issue for the usual authorized purposes bonds of which the total should not exceed \$25,000,000,000 at any one time; the previous limitation of \$28,000,000,000 had applied to the total of all successive issues, even though some of the issues had merely retired others. As to certificates of indebtedness, Treasury bills, and United States 1-to-5-year notes, their combined total outstanding at any one time was limited to \$20,000,000,000, of which the first two categories must not exceed \$10,000,000,000. The act also authorized the issue of United States Savings Bonds (see *Popularizing Federal Issues under Administration* above).

Gold Clause Act. Signed August 28. By this act the Government denied to its creditors the right to seek, through its courts, to compel it to perform its abrogated promise to pay certain of its funded debts in money of equal value, in terms of gold, to that which it had borrowed. The President asked for such a measure in a special message of June 27. The measure as introduced would have withdrawn immediately the Government's consent to be sued on its gold obligations. Adverse sentiment in the Senate forced a compromise, eventually adopted, by which the withdrawal of consent to be sued was to become effective only on Jan. 1, 1936. To offset risks of the institution of suits there was incorporated in the act a requirement that the Treasury redeem until July 1, 1936, at par and interest (in the devalued new currency), any Federal securities carrying the gold clause that might be presented. This move was designed to preclude or hinder allegations of substantial damage on litigants' part.

Neutrality Act. Signed August 28. This act, limited in its operation to six months ending with Feb. 29, 1936, laid down a course for the Administrative branch to follow in the maintenance of neutrality toward foreign belligerents. The President was directed to proclaim the fact when a state of war abroad existed. Upon this proclamation it was to become unlawful to export arms and munitions to the belligerent states directly or indirectly, under pain of fine up to \$10,000 and imprisonment up to five years. A National Munitions Control Board

consisting of the secretaries of State, the Treasury, War, the Navy, and Commerce was created to make rulings as to munitions. Manufacturers of arms were required to register with the Secretary of State, paying a fee of \$500 each, as a prerequisite to exporting their goods. The President was authorized to warn citizens not to travel on the vessels of a belligerent, save at their own risk.

Congress and the Soldiers' Bonus. A Patman Bonus bill, somewhat similar to that of 1934, failed by a narrow margin to become a law over the President's veto. The bill required immediate payment of the adjusted service certificates that the veterans of the war had received from the Government in 1925 and that were to mature in 1945; it thus would have donated to the holders of these certificates the difference between the value of immediate payment and that of payment deferred for some 10 years. The cost of this proposed course, to the Government, was estimated as likely to be somewhat over \$2,200,000,000 in addition to the accruing special fund to meet ultimate payment.

The bill proposed to cover this excess by the issue of United States notes not bearing interest ("greenbacks"). This proposal earned it the support of a considerable group in Congress that favored inflation of the currency; on the other hand support for the bill was somewhat split by a rival bill, which proposed immediate payment without inflation (Vinson bill). The House passed the Patman bill on March 22 by 318 votes in favor, to 90 opposed. The Senate, after considering other plans of immediate payment, passed the Patman bill May 7 by 55 votes to 33 on the roll call; the majority included 43 Democrats, 10 Republicans, 1 Progressive, and 1 Farmer-Laborite.

The President in vetoing the bill took the unprecedented course of going before Congress and delivering his veto *in propria voce*. This was done on May 22, in a discourse of some 5000 words. The purpose of the President's taking this step was stated to be the reaching of the public by radio, the speech being broadcast. The House immediately overrode the veto by 322 votes to 98. The Senate, voting next day, gave 54 votes for overriding the veto and 40 for sustaining it. Norbeck, announced as for overriding, was the sole absentee. The majority, even with his vote, would have lacked nine votes of the necessary two-thirds. The proposal accordingly failed of adoption.

Total of Appropriations. Chairman Buchanan of the House's committee on appropriations estimated that the entire amount appropriated by the session would be \$10,250,000,000. This estimate, made at adjournment did not reckon the Third Deficiency Bill. That bill, carrying some \$93,000,000 for divers authorized uses, had remained unpassed at adjournment; it had been saddled with provisions for governmental loans on cotton at 12 cents a pound and loans on wheat. The \$4,000,000,000 for "work relief" and the \$2,200,000,000 of yearly recurring appropriations made the bulk of the appropriated total.

JUDICIARY

Supreme Court. The Court in a series of decisions of exceptional import overthrew in whole or in part a number of the legislative and administrative acts of the New Deal. These included the National Industrial Recovery Act, the administrative control over petroleum established under that act, the Federal system of pensions for employees of railroads, the Federal moratorium on farm mortgages, and the executive power of removal

as exercised against a member of the Federal Trade Commission. The validity of the repeal of the gold clause was sustained as applying to private and to public non-Federal obligations and as to Federal currency, but was found invalid as to the bonded debt of the Federal Government. In some of these adverse decisions the Court was closely divided, part of the time into what had been considered the liberal and the conservative groups; in others the Court was unanimous in condemnation.

The Gold-Clause Decisions (February 18). There were four cases. Two (*Norman vs. Baltimore and Ohio Railroad* and *United States vs. Bankers Trust Company*) had to do with railroads' bonds; a third (*Nortz vs. United States*), with gold certificates of the Treasury; the fourth (*Perry vs. United States*), with Liberty bonds. An opinion of five Justices in the two cases of private debts, written by Chief Justice Hughes, held that the Government had power to override private contracts such as the gold clauses in private bonds, and that the Government could do this even in regard to States' and municipalities' contracts. In the third case the court held (opinion by Chief Justice Holmes) that the holder of a gold certificate was not entitled to receive for it from the Government more than its face value in existing currency at the time (before statutory devaluation) when surrender had been made in this case; that as the possession of gold was prohibited, he could not have kept the gold had he received it. The opinion held it needless in the actual case to pass upon the questions whether the certificate was a contract actionable in the Court of Claims and whether the compulsion to surrender the gold certificate was a taking of property under the Fifteenth Amendment. These questions therefore remained open.

In the *Perry* case, four (Hughes, Brandeis, Roberts, and Cardozo) held that Congress had no constitutional power to "withdraw or ignore" the United States' pledge of its credit. While this view seemed to nullify the repudiation of the gold clause in Federal bonds, the opinion (written by Chief Justice Hughes) rendered the gain to the holders of these bonds nugatory by further declaring that since no "actual loss" in purchasing power had been proved by the plaintiff, he was not entitled to receive more currency than the face of the bond, having failed to show cause of action. Stone concurred as to the nonsuiting of *Perry*; he dissented from the view that Congress lacked power to abrogate its gold obligation, when this was a stipulation in its pledge of credit.

The "conservative" minority of four (McReynolds, Van Devanter, Sutherland, and Butler) on the contrary, held the abrogation of the gold clause unconstitutional with regard to all the four cases alike. The minority's opinion (by McReynolds) denied that there existed "any definite delegation of power" in the constitution for what was in effect "repudiation and spoliation of citizens."

The effects of the decisions were: (1) to overthrow all contentions of the legal validity of claims for payment in gold or in dollars of value equivalent thereto, under private and apparently State contracts of debt; (2) to overthrow all such claims, as based on the governmentally-forced surrender of gold certificates; (3) to nonsuit certain existing claims for such payment in the case of Federal pledges of credit (bonds, etc.) bearing the gold clause; (4) to overthrow the doctrine that Congress had authority to repudiate the United States' pledge of its credit; (5) to leave open a possibility

of recovering on claims against Government bonds under other economic conditions or by some other sort of suit. On the first three points the Court stood 5 to 4; on the last two it stood 8 to 1.

Invalidation of Recovery Act. The Court's first ruling against features of this act was made on January 7, as to a Federal prosecution for interstate transportation in alleged contravention of the petroleum code; this code had been established under separate authorization provided in Section 9 of the act. The majority's opinion (Cardozo alone dissenting) was written by Chief Justice Hughes. It held Section 9, Subdivision C of the act an unconstitutional delegation of power. This part of the act sought to give the President authority to prohibit the transportation of petroleum out of a State, in excess of the amount permitted by the State's authority. The Chief Justice remarked that an executive order eliminating the prohibitory clause from the petroleum code had been executed Sept. 13, 1933, but that the order had not been made known when violation was prosecuted in the lower courts, wherefore the old order, though made known to the Supreme Court, was not allowed to avail to bar a decision.

United States vs. Schechter. The Court unanimously held on May 27 that the Recovery Act was unconstitutional and invalid, with regard to codes: (1) in that "the code-making authority thus conferred is an unconstitutional delegation of legislative power"; (2) that attempts to fix by code the wages and hours of employees in intrastate business were invalid, further, as exceeding the Federal power to regulate interstate commerce. As to the first point, Congress was held to have left to the President the defining of codes' objects to such a degree as to have empowered him to make positive laws. As to the second point, the Federal authority was held able to regulate intrastate commerce only so far as such commerce affected interstate commerce directly. The result of the decision, in the field of actual practice, was to render the act useless for Federal rule over industry.

Farm-Mortgage Moratorium Unconstitutional. In *Louisville Land Bank vs. Radford*, on appeal of a creditor against a farmer mortgagor who invoked the Frazier-Lemke Act to escape foreclosure, the Court held unanimously on May 27 that the act transgressed the Fifth Amendment's prohibition against taking private property for public use without just compensation. The opinion (by Brandeis) found the interest of 1 per cent a year as set by the act "obviously not the rate of money," and the bestowal on the bankrupt mortgagor of the right to keep tenure and buy his property back by deferred payments a deprivation of the creditor.

President's Power of Removal. The appeal of the executor of the estate of former Federal Trade Commissioner William E. Humphrey, as to Humphrey's dismissal by the President for non-consonance with the Administration's views, was decided against the Government, on May 27. The court held (opinion by Sutherland) that a Trade Commissioner could not be removed except on statutory grounds, and that his removal "at the mere will of the President . . . might thwart in large measure the very ends which Congress sought to realize by definitely fixing a term of office."

Railroad Retirement Act Invalid. The Court, by a decision of 5 to 4, overthrew on May 6 the act of 1934 for retiring old railroad employees on pensions. The majority were Justices Roberts (who wrote the opinion), Sutherland, McReynolds,

Butler, and Van Devanter; the minority included the more "liberal" wing of the Court. The case at issue was *Railroad Retirement Board vs. Alton Railroad et al.* The majority's opinion held that the law imposed burdens on the railroad companies for no true purpose warrantable as control of interstate commerce, but "purely for social ends," lying "obviously outside the orbit of Congressional power." The minority's opinion (by Hughes) took sharp issue.

Matters Affecting States. A decision reversing the Supreme Court of Ohio was rendered in January, against the Public Utilities Commission of Ohio, which was held to have ordered the West Ohio Gas Company to sell gas at an unduly low rate. On April 1 the conviction in Alabama of Clarence Norris, one of the nine Negro boys tried in the Scottsboro case (see ALABAMA) was set aside and a new trial was ordered. The Court held that Negroes had been unjustifiably omitted from jury duty in the State and that the convicted Negro had therefore not received "the equal protection which the Constitution guarantees." The case brought by R. R. Grovey, a Negro of Texas seeking the right to vote in the State Democratic primary elections, was decided on April 1 against Grovey; the Court held valid the State Democratic Convention's declaration of May, 1932, permitting only whites to be members of the party. On April 29 the Court ruled that the Federal Government could not prevent the State government of Arizona from halting Federal construction of the Parker Dam in the Colorado River. On May 20 the court refused on grounds of procedure to reverse the conviction, in Georgia (q.v.), of a Negro Communist, Angelo Herndon, under a State law against inciting violence.

Removal of the Court. The Supreme Court left its old seat, the former Senate Chamber in the Capitol, at the end of June. On resuming after the summer vacation, it occupied the new Supreme Court Building on October 7.

Other Federal Courts. A great number of suits relating to the "New Deal" occupied the District and Circuit Courts. Some of these concerned the constitutionality of acts on which the Supreme Court passed fairly early in the year. Many others had to do with the TVA and the AAA, as to which the Supreme Court undertook only in October to hear test cases. A circuit Court's decision at Birmingham (Judge Grubb) granted an injunction against the TVA's acquiring properties from the Alabama Power Company; this was reversed by a Circuit Court at New Orleans and appeal was taken to the Supreme Court. The Circuit Court at Providence (Judge Lett) ruled on March 13 against the AAA's efforts to regulate by code and licenses the production and sale of milk in Rhode Island. The Circuit Court at Cincinnati held in July that the Federal Government could not use the process of condemnation to obtain land on which to build low-cost dwellings, through the PWA, for poor people. This object was denied to be a public use. The Federal District Court at Baltimore (Judge Coleman) declared November 7, in a suit concerning the American States Public Service Company, that the Utility Holding Company Act was unconstitutional in its entirety. These decisions are but samples of the multitude of decisions of diverse tenor as to the constitutional merit of new forms of authority that had been created. As to the AAA's processing taxes, the Circuit Court at Boston held on July 16, in the Hoosac Mills case that these levies were unconstitutional.

This was followed by the passage by Congress of a prohibition against suits to recover such taxes; but there were granted a huge number of temporary injunctions against their collection. As to the NRA, when it was invalidated the Attorney-General dropped no less than 411 suits that he was entertaining for its enforcement. See LAW.

UNITED STATES MILITARY ACADEMY. A government institution at West Point, N. Y., for the theoretical and practical training of cadets for the military service of the United States, opened in 1802. On Sept. 1, 1935, the total number of cadets was 1591. There were 185 members of the faculty. The academy is a component part of the Regular Army of the United States and is maintained solely by appropriations from the War Department, which in 1935 amounted to \$2,297,058 for salaries and maintenance of public works. The library contained more than 102,000 volumes. Superintendent, Maj. Gen Wm D. Connor, U.S.A.

UNITED STATES NAVAL ACADEMY. A school for the education and training of midshipmen in Annapolis, Md., founded in 1845. The total number of midshipmen at the beginning of the academic year 1935-36 was 2022. The faculty numbered 275. The library contained 80,000 volumes. Midshipmen, after graduation, are commissioned ensigns in the U.S. Navy, except for a few who are commissioned second lieutenants in the U.S. Marine Corps. Superintendent, Rear Admiral David Foote Sellers, U.S.N.

UNITED STATES OF EUROPE. While the goal of European political union, proposed by Foreign Minister Aristide Briand of France in 1930, seemed further than ever from realization in 1935, there was a strengthening of the principle of collective security which, according to some observers, represented the foundation stone of a future United States of Europe. For the first time in history the European nations applied financial and economic sanctions against an aggressor (see ETHIOPIA and ITALY under *History*; LEAGUE OF NATIONS). The network of mutual assistance pacts was further extended and the activities of the Balkan and Baltic Ententes (q.v.) reflected continued progress toward regional political and economic unions, which might later provide the basis for a federation of European States.

UNIVERSALISTS. A religious denomination, existing chiefly in the United States, Canada, Japan, and Korea, which holds as part of its doctrine the universal fatherhood of God, the universal brotherhood of man, the certainty of punishment for sin and the final harmony of all souls with God. In 1935 there were 28 State Conventions and 2 State Conferences. The number of churches was 577; ministers in fellowship, including lay licenses, 505; church members, 52,405, and Church Schools, 350. The departmental work is carried on by different organizations including The Women's National Missionary Association, The Young People's Christian Union, and The General Sunday School Association. The denominational periodical, the *Christian Leader*, is published weekly. Rev. W. H. Macpherson, L.H.D., of Joliet, Ill., is president of the Universalist General Convention. Headquarters of the denomination: 16 Beacon St., Boston, Mass. See FREE CHURCH FELLOWSHIP.

UNIVERSITIES AND COLLEGES. Statistics. Attendance. Dr. Raymond Walters, reporting in *School and Society* on registration in American universities and colleges, states that the enrollment for 1935 was 6.6 per cent greater than

that for 1934, while that for 1934 was 5 per cent greater than that for 1933.

In the 577 approved institutions with which the report was concerned there were "700,730 full-time students and a grand total (including part-time and summer-school registration) of 1,063,472 resident students."

The 577 institutions considered are those that are approved by various regional associations as reported by the American Council of Education. They include 105 universities, 354 colleges of arts and sciences, and 118 technological institutions.

The enrollments in junior colleges was not included in the totals.

The report shows that the enrollment in 55 universities under public control was 8.3 per cent greater in 1935 than in 1934, while the 49 universities under private control had an increase of only 3.6 per cent.

There were pronounced differences in the increases between various sections of the country and even between different States in the same section. The 41 institutions in Arkansas, Louisiana, Oklahoma, and Texas, with an increase of 10.35 per cent, led the regions. The 39 institutions in the six new England States had an increase of only 2.25 per cent. The 17 institutions in Kansas had an increase of 21.03 per cent. The 12 institutions in South Carolina had an increase of 16.10 per cent, while the five institutions in West Virginia suffered a decrease of 3.73 per cent.

In February, 1934, the Federal Government allotted funds for the help of needy students in colleges and universities. At first this programme was conducted by the Federal Emergency Relief Administration. During the past year the programme was conducted by the National Youth Administration which has a director in each State. The provisions that were in operation for the college year beginning in September, 1935, include the following:

Students must be selected from among those who, without Federal help, would be unable to attend or to continue in college. . . . A student will be permitted to earn as much as \$20 a month, but each college will be allotted funds on the basis of \$15 a month for each 12 per cent of its enrollment of full-time, resident students . . .

Funds allotted shall be used to pay students for doing socially desirable work, including the sort customarily done in the institution by students who are working their way through college, such as clerical, library, and research work. The programme is intended also therein to provide unique educational and socially useful opportunities which would in many cases supplement a student's classroom activities.

The National Director reports that monthly allotments amounting to \$1,559,645 for undergraduates, and \$79,300 for graduates were given to 109,001 students in 1602 institutions.

This unusual condition makes it difficult to interpret the true significance of college and university enrollment. When the Federal aid was first given to students, it was stipulated that the purpose was to increase the number of young men and women going to college and that at least half of the funds must be paid to new students. The allotments were given to 12 per cent of the institution's enrollment. The registration in the approved colleges and universities of full-time students increased 12.8 per cent between 1933 and 1935. College and university authorities are concerned with what would happen if the Federal appropriations for needy students should end.

Dr. Walters has pointed out that the increase in part-time and summer-school students in these two years was approximately 23.9 per cent, yet

these students were not aided by the Federal Government.

Junior Colleges. On Dec. 1, 1935, there were 519 junior colleges with a total enrollment of 122,514. This is an increase of 13.6 per cent over the preceding year. More than 17 per cent of full-time students enrolled in college courses are now in junior colleges.

Only four States report no junior colleges. These are Delaware, Nevada, Rhode Island, and Wyoming. The six States having the largest number of junior colleges are California, 55; Texas, 43; Iowa, 37; Missouri, 22; Illinois, 21; and Mississippi, 21.

The institutions under public control number 214, with an enrollment of 82,701. Those under private control number 305, with an enrollment of 39,610. Public institutions are located in 33, and those under private control are in 42 States.

Only three of the publicly controlled institutions are for men only. All the others are coeducational. Among the privately controlled junior colleges 41 are for men, 101 for women, and 163 coeducational.

More than half of the privately controlled institutions are under denominational control. The Methodists lead with 41 institutions.

The most characteristic form of organization is the two year college. In such institutions the ordinary freshman and sophomore courses are given. The report shows that there were 68,249 freshmen and 38,791 sophomores.

Many of the institutions are closely connected with the high school. It is, therefore, possible to make use of the high school teachers. The reports indicate that there are 5037 full-time and 3312 part-time instructors.

Some private academies and secondary schools that would have been compelled to close their doors found it possible to continue as junior colleges with a large degree of success.

Graduate Study in the United States. The United States Office of Education published a bulletin entitled, *Graduate Study in Universities and Colleges in the United States*. The study shows that the remarkable increase in secondary and collegiate students is reflected in the number of students that are working for advanced degrees.

Prior to 1870, there were but few graduate students in the universities. For the year 1870-71 Yale University reported 24; Harvard, 8; and Princeton, 3. The following table shows the number of graduate students enrolled at different years since 1871-72.

Year	No of graduate students	Year	No of graduate students
1871-72 ..	198	1910 . . .	9,370
1880-81	460	1920	15,612
1890	2,382	1930 . . .	47,255
1900 .	5,831		

The accompanying table gives the number of advanced degrees awarded in certain years since 1890.

Year	No. of Ph.D. degrees			No. of masters' degrees*		
	Men	Women	Total	Men	Women	Total
1890	44	70
1900	322	20	164	1,405	339	1,744
1910 . . .	365	44	342	1,821	619	2,440
1920 .	439	93	532	3,873
1926 .	1,115	187	1,302	7,005
1928	1,249	198	1,447	7,204	4,582	11,766
1930	1,692	332	2,024	8,766	5,729	14,495

* Masters' degrees awarded in 1932 totaled 19,339

In another report, the Office of Education states that during 1934-35, the universities and colleges conferred approximately 3000 doctor of philosophy degrees and 25,000 masters' degrees.

The increase of advanced students who have been expected to deal with research is a matter of concern to many institutions. Investigations show that a large proportion of those who obtain the doctorate never conduct research after their graduation. As a result, there is a tendency to shift students from strictly scientific research practices to more liberal and practical efforts. In some institutions the candidates for the master's degree no longer are required to submit a thesis in partial fulfillment for the degree. There is a like tendency in the requirement for the doctorate. Institutions that grant the doctor of philosophy degree still hold to the requirement of a dissertation but a number of universities are granting doctors' degrees other than doctor of philosophy. In such cases the candidates often do not submit dissertations which are the result of scientific research.

The problem that confronts the institutions with large numbers of graduate students is that of providing effective instruction for research workers. Some institutions have eliminated the master's thesis primarily because the numbers of students are such as to make it impossible to direct their efforts properly.

Academic Freedom. The freedom of college and university teachers to deal unhampered with social and economic questions has become a matter of great importance to all institutions. It is generally true that the teachers in all educational institutions have been required to take the oath of allegiance wherever such laws have been enacted. The laws do not specifically mention private institutions, but such institutions do receive exemptions from taxation and in this way they too become subject to the requirements of the law.

It is certain that the laws requiring "loyalty oaths" have been more directly aimed at the institutions of higher learning than at the public school teachers. There is a widespread impression that there are college professors who are not content to discuss disputed social and economic doctrines but that they definitely attempt to indoctrinate students with their own views. It makes little difference what these views may be, there is always some group or interest that pronounces them "un-orthodox."

A surprising number of institutions have been under the fire of criticism during the year. Trouble has not been confined to any one section of the country nor to any one type of institution. Matters that earlier would have aroused little or no interest except in the institution concerned now are featured in newspapers throughout the country. One of the most important institutions was the victim of such publicity merely because the parent of one student charged that his daughter was instructed in radical views. An investigation by the State legislature was threatened, yet a careful investigation by competent people revealed that there was no foundation to the charge.

The efforts to limit the teaching within colleges and universities are increasing. The questions which are raised have become a real challenge to educators.

One of the clearest statements of the purpose and obligations of academic freedom as the universities view these matters is found in the report of President Nicholas Murray Butler for 1935. He writes:

It [academic freedom] relates solely to freedom of thought and inquiry and to freedom of teaching on the part of accomplished scholars as these were first established some two hundred years ago at Halle and at Göttingen. Its object is to make sure that scholarship and scientific inquiry may advance without being hampered by particular and specific religious or political tenets. Academic freedom has never meant, and could not possibly mean in any land, the privilege, much less the right, to use the prestige, the authority and the influence of a university relationship to undermine or to tear down the foundations of principle and of practice upon which alone that university itself can rest. Were a university to permit conduct of this kind on the part of its members, the result would only be to add a slow undermining of the university's influence and repute to open attacks upon them.

Before and above academic freedom of any kind or sort comes university freedom, which is the right and obligation of the university itself to pursue its high ideals unhampered and unembarrassed by acts or conduct on the part of any of its members which tend to damage its reputation, to lessen its influence or to lower its authority as a centre of sound learning and moral teaching. Those whose convictions are of such a character as to bring them in open conflict with the university's freedom to go its way toward its lofty aim, should in ordinary decency and self-respect withdraw of their own accord from university membership in order that their conduct may be freed from the limitations which university membership naturally and necessarily puts upon it.

Education in the Civilian Conservation Corps. The most outstanding achievement of adult education is to be found in the educational programme developed in the Civilian Conservation Corps. This work, begun in February, 1934, has reached proportions that are astonishing. The latest available reports show that for the month of September, 1935, there were 31,012 courses offered. Of these 5399 were elementary courses, 7840 were high school courses, 2324 were college courses, 11,430 were vocational courses, and 4019 were general courses. Approximately 230,889 persons were enrolled in these courses. The instructors number 20,308.

The U.S. Office of Education has reported that more than 57,000 men are enrolled in forestry courses, about 13,000 are studying soil erosion, 4800 are enrolled in photography, and 2853 are studying radio.

The camps are supplied with "outlines of instruction" in some fifteen specific occupations. A total of 5118 educational films were shown to 290,541 men. About 328,069 books were circulated among 207,475 men. More than 109,000 men were engaged in about 5000 different hobby activities.

The dominant aims or purposes of the camp educational activities are stated in "A Handbook for Educational Advisers in the Civilian Conservation Corps Camps" as follows:

Building wherever possible upon the activities already under way, the aims of the strengthened and broadened educational programme are:

1. To develop in each man his powers of self-expression, self-entertainment, and self-culture.
2. To develop pride and satisfaction in cooperative endeavor.
3. To develop as far as practicable an understanding of the prevailing social and economic conditions, to the end that each man may cooperate intelligently in improving these conditions.
4. To preserve and strengthen good habits of health and of mental development.
5. By such vocational training as is feasible, but particularly by vocational counseling and adjustment, to assist each man better to meet his employment problems when he leaves camp.
6. To develop an appreciation of nature and of country life.

Educational Foundations. The annual report for 1934 of the 20th Century Fund gives the disbursements of 123 American foundations privately subsidized for the public good. The report shows that these foundations cut their contributions in half between 1930 and 1934.

During 1934 the field of education received the

largest gifts amounting to a total of \$8,972,646. This was 26.9 per cent of the total given.

The fields of interest that received \$500,000 or more from these foundations were the following:

Education	\$8,972,646
Medicine and public health	8,609,710
Social welfare	3,896,487
Social sciences	3,084,343
Physical and biological sciences	1,746,662
International relations	1,048,016
Economics	1,021,532
Humanities	728,178
Government and public administration	699,832
Æsthetics	681,240
Child welfare	502,091

The foundation having assets of \$10,000,000 or more were:

Carnegie Corporation of N. Y.	\$157,553,073
Rockefeller Foundation	153,609,942
General Education Board	45,822,414
Commonwealth Fund	42,903,684

Changes in Organization. For a long period the college curriculum grew in the direction of pronounced specialization. Departments developed with little regard for each other. The increase in knowledge was so great that every field could be extended and yet keep within legitimate boundaries. Recently, the effectiveness of such departmentalization has been under question. Colleges and universities began to offer orientation courses which ignored the boundaries of the various fields while making use of all of them. The development of social science as a subject tended further to ignore departments. The catalogues of higher institutions now show a decided tendency to name several instructors with a single course. Such instructors do not always belong to the same department.

This movement tends to bring the learner to the centre of attention. There is no attempt to weaken the department; on the contrary it is strengthened, but it works more in accord with other departments than was possible under former conditions. The professor is still a member of a departmental group and is still concerned with the extension of knowledge within his own field.

Harvard University proposes a series of "university professorships" that will not belong to any department nor to any particular faculty of the university. President Conant has termed them professors "without portfolio" or "with roving commissions."

The Youth Commission. The American Council on Education has announced the organization of a commission to study the problems connected with the care and education of American youth. The study was made possible by a grant of \$500,000 by the General Education Board. This is to be used over a period of five years. There is also a supplemental grant of \$300,000 to be used for such purposes as the commission may determine.

The commission is composed of fourteen outstanding civic and educational leaders. They are Will W. Alexander, Atlanta, Georgia; Newton D. Baker, Cleveland, Ohio; Ralph Budd, Chicago,

Illinois; Lotus D. Coffman, Minneapolis, Minnesota; Dorothy Canfield Fisher, Arlington, Vermont; Willard E. Givens, Washington, D. C.; Henry I. Harriman, Boston, Massachusetts; Robert M. Hutchins, Chicago, Illinois; Chester H. Rowell, San Francisco, California; William F. Russell, New York City; Edith B. Stern, New Orleans, Louisiana; John W. Studebaker, Washington, D. C.; Marion Van Waters, Framingham, Massachusetts; and Matthew Woll, New York City.

At the opening meeting of the commission the president of the Council outlined the possible work of the commission as follows:

(1) A comprehensive analysis of the characteristics of youth, and an evaluation of the influences to which they are subject.

(2) The continuous study of commonly accepted goals in the care and education of American youth, for the purpose of determining the adequacy of these goals in relation to present social, economic, and political trends.

(3) The investigation of agencies concerned with the youth problem, and the eventual recommendation of procedures which seems to influence young people most effectively.

(4) The systematic popularization and promotion of desirable plans of action through conferences, publications and demonstrations of promising procedures.

The commission selected Dr. Homer P. Rainey, President of Bucknell University, as director of the staff. He will associate with himself a staff of capable people who will compose a somewhat permanent organization. It is proposed that the commission make use of and cooperate with existing agencies that care for the education of youth.

URUGUAY, úrōō-gwā or ōō'rōō-qwí'. A South American republic. Capital, Montevideo.

Area and Population. With an area of 72,153 square miles, Uruguay had an estimated population of 1,993,234 on Jan. 1, 1934, compared with 1,042,686 at the 1908 census. Montevideo, with 671,812 inhabitants in 1935, had one-third of the total population. Estimated populations of other cities (1930) were: Paysandú, 37,000; Salto, 35,000; Mercedes, 30,000; Minas, 28,000. The population is almost entirely of European blood, with Spanish, Italian, and Portuguese strains predominating. Living births in 1933 numbered 41,650; deaths, 20,358; marriages, 9520; immigration, 138,639; emigration, 136,952.

Education. Elementary education is compulsory and both primary and secondary education is free. Public and private elementary schools in 1933 numbered 1548, with 186,435 pupils; the secondary school enrollment was 11,856; and the University of the Republic at Montevideo had 13,766 students (1932).

Production. Stock raising is the chief industry, only about 7 per cent of the productive area being devoted to crops. In 1933 animal products accounted for 85 per cent of the value of all exports. Live-stock in 1935 included 18,000,000 sheep, 7,000,000 cattle, and 100,000 swine. During 1934, 1,110,000 cattle, 1,075,329 sheep, and 61,336 swine were slaughtered. Wool production in 1934-35 was 59,000 metric tons. Production of the chief crops in 1934-35 was (in metric tons): Wheat, 307,000; barley, 5700; oats, 53,400; linseed, 120,600. The 1933-34 corn crop was 123,257 metric tons; the wine yield, 583,000 hectoliters. Potatoes, beans,

olives, and tobacco are other crops. Meat packing is the principal industry.

Foreign Trade. Provisional 1934 returns showed imports of 62,712,339 pesos (appraised values, estimated to be from 10 to 25 per cent under market values), compared with 60,652,636 pesos in 1933. Exports were 69,800,566 pesos (66,637,590 in 1933). Import values from the principal sources of supply (in 1000 pesos) were: Great Britain, 11,255; United States, 9352; Argentina, 5744; Germany, 5410; Brazil, 4674. Exports (in 1000 pesos) went mainly to: Great Britain, 17,766; Germany, 11,882; United States, 7273; Italy, 5297; Belgium, 5110; Brazil, 5081. The chief exports in 1934 were (in 1000 pesos): Wool, 17,580; canned meat, 9563; hides and skins, 8453; flaxseed, 4782; wheat, 4503; chilled beef, 4303; frozen beef, 3806. Petroleum products, coal, silk fabrics, and yerba mate are the principal imports.

Imports in 1935 totaled 59,959,272 pesos; exports, 95,356,862 pesos. United States statistics for 1935 showed imports from Uruguay of \$6,887,268 (\$4,711,203 in 1934) and exports to Uruguay of \$6,222,007 (\$6,140,456).

Finance. Budget estimates for the calendar year 1935 placed receipts at 84,162,974 pesos (59,044,045 in 1934) and expenditures at 83,898,420 pesos (58,181,533 in 1934). The Treasury reported an actual deficit of 3,445,462 pesos in 1933 and a deficit of 839,000 pesos in 1934. The public debt as of Dec. 31, 1934, totaled 313,604,623 pesos (\$246,806,838), of which 141,669,765 pesos represented the external debt, 167,069,358 pesos the internal, and 4,865,500 pesos the international debt. Uruguay defaulted on amortization payments on the external debt on Jan. 20, 1932. Interest payments were continued at the rate of 3½ per cent during 1934 and 1935.

The Uruguayan peso (par value, \$1.7511) exchanged at an average of \$0.7869 in the official market during 1934, while its value in the free market ranged from \$0.40 to \$0.50.

Communications. Uruguay in 1934 had 1729 miles of railway lines open for traffic, including 205 miles of state-owned lines; 8663 miles of highways, including about 800 miles of paved roads; extensive navigable waterways; and connections at Montevideo with the inter-American air network. A total of 7437 vessels of 10,397,419 net register tons entered the ports in the overseas trade during 1933.

Government. Under the new Constitution adopted at the general election of Apr. 19, 1934, the former system dividing executive power between the President and National Administrative Council was abolished. Executive powers were concentrated in the hands of a President elected for four years by the legislature. His cabinet or Council of Ministers consisted of nine members representing the two political parties which polled the largest number of votes at the presidential election. The legislative powers were vested in a parliament consisting of a Senate of 30 members elected at large for four years and a Chamber of Deputies of 99 members elected by districts for four years. If the two parties polling the highest number of votes in the presidential elections obtain an absolute majority, the Senate seats are divided equally between them. If not, the seats are distributed by proportional representation. President in 1935, Dr. Gabriel Terra, who was reelected Apr. 19, 1934.

History. The long-expected revolt against President Terra's mild dictatorship broke out towards the end of January, 1935, the ringleaders

being Gen. B. Munoz and A. G. Morales. After a week's fighting, marked by numerous desertions of government troops to the rebels, the government crushed the insurrection and many of the rebel leaders fled across the border to Brazil. On February 9 the government relaxed the censorship and other emergency measures imposed upon the outbreak of the revolt. Unrest and political agitation continued, however. On March 19 the President reorganized his cabinet. On June 2 he was slightly wounded in the leg by a would-be assassin, who fired upon him during the ceremonies marking the state visit to Montevideo of President Vargas of Brazil. Early in August, however, the President announced that exiled political opponents of his régime would be permitted to return. On November 17 he revoked the emergency measures for the defense of the state in effect since the January revolt.

Charging that the Soviet Legation in Montevideo had been financing and directing Communistic agitation in other South American countries, and particularly in Brazil (q.v.), where a radical revolt had occurred in November, the Uruguayan Government on Dec. 27, 1935, severed diplomatic relations with the Soviet Union by sending their passports to the Soviet Minister and other members of the Legation staff. Uruguay was the only South American country which had recognized the Soviet Government and which maintained direct trade relations with the Soviet Union.

Although moderate gains were recorded, Uruguay's economic recovery continued to lag behind that of her two great neighbors—Argentina and Brazil. Accordingly the government on Aug. 14, 1935, supplemented the trade balancing law of Nov. 9, 1934, and the economy budget approved in January, 1935, with a third reconstruction measure—the gold revaluation law. This measure provided for revaluation of gold and silver stocks on the basis of the average value of the peso in official exchange for the preceding two months, or about \$0.45 in U. S. currency. Of the 55,265,440-peso profit accruing to the Treasury, the government allotted 15,600,000 pesos for public works, 11,984,416 for the cancellation of outstanding bank loans, 8,000,000 for mortgage relief, 6,070,000 for social welfare, 2,750,000 for education, and 4,360,923 for miscellaneous projects. An additional 6,500,000 pesos was invested in the exchange stabilization fund.

The bill also established an autonomous issue department within the Bank of the Republic and limited the maximum note issue to 101,000,000 pesos. It also provided for redemption of a number of internal loans and for the replacement of four external issues, to the extent that they were held in Uruguay, by an internal issue of 20,000,000 pesos, bearing 6 per cent interest and 1 per cent amortization.

The policy of balancing imports and exports with individual countries through government control of foreign exchange transactions was continued. Early in 1935 a Foreign Commerce Advisory Board was created to advise the President and the Bank of the Republic on the negotiation of trade agreements with foreign governments, the fixing of import quotas, and the allocation of exchange.

See BOLIVIA under *History*. Consult Simon G. Hanson, "The Uruguayan Plan for Economic Reconstruction," *Commercial Pan America* (Pan American Union, Washington, D. C.), October, 1935, No. 41.

UTAH. Population. On Apr. 1, 1930 (Fifteenth Census), 507,847; July 1, 1934 (latest Federal estimate), 520,000; 1920 (Census), 449,396. Salt Lake City, the capital, had (1930) 140,267 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod. Bu.</i>	<i>Value</i>
Hay (tame)	1935	556,000	1,078,000*	\$7,438,000
	1934	501,000	541,000*	6,762,000
Sugar beets	1935	42,000	511,000*
	1934	32,000	250,000*	1,100,000
Wheat	1935	248,000	5,512,000	4,364,000
	1934	220,000	3,147,000	2,627,000
Potatoes	1935	13,600	2,040,000	1,224,000
	1934	13,000	1,040,000	551,000

* Tons.

Mineral Production. Gold, silver, copper, lead, and zinc to the value of \$22,975,534 were mined in the State in 1934. To this total, 136,582 fine oz. of gold contributed \$4,773,524; 7,111,417 oz. of silver, \$4,597,280; 86,024,925 lb. of copper, \$6,881,994; 116,153,945 lb. of lead, \$4,297,696; and 56,396,279 lb. of zinc, \$2,425,040. The production of coal in the State increased to a total of some 2,985,000 tons for 1935, from that of 2,406,183 for 1934 (revised). While the commercial production of natural gas remained small, being some 37,441 M cu. ft. for 1934, an apparently important field of natural gas was discovered in Emery County. Its flow was shut off to await consideration of a proposal to construct a pipe line to Marysville, Utah, to deliver the gas as fuel for the smelting of ores of aluminum.

Education. The number of inhabitants of school age, as reckoned for Oct. 31, 1934, was 148,293. The enrollments of pupils in the public schools in the academic year 1934-35 numbered 142,027. Of these, 84,571 were in common schools or elementary grades, and 57,456 were in high schools. The year's expenditures for public-school education throughout the State totaled \$10,190,313, substantially exceeding the total of the year previous. The average of the teachers' yearly salaries likewise rose, by some 6 per cent, to \$1139.61.

In common with the school authorities of many other States, the Superintendent of Public Instruction engaged during 1935 in the task of altering the curriculum of the public schools. Unemployment among teachers holding qualifying certificates was reported as negligible.

Legislation. The Legislature enacted a measure to permit the establishment of a State system of unemployment insurance; the intention was that the system should be put in effect after the passage of the Federal Social Security Act, which provided a Federal subvention to State systems of this sort. Passed in advance of the Federal act, that of Utah provided that a distinct account be kept with regard to payments to employees of each firm, and that the payments made by the employers be amassed in part in a central fund. The total contributions required of employers were normally to be in the proportion of 3 per cent to their respective payrolls.

A State monopoly of the retailing of liquor was created; shops operated by the State were to handle a wide variety of liquors and wines, selling by the package. The Legislature gave the State's ratification to the proposed amendment of the Federal Constitution to authorize Congress to regulate the labor of the young.

Political and Other Events. A State Planning Board made a study of the condition of in-

habitants of holdings considered to be below the standard for tenure and development as farming land; it recommended the removal of some 12,000 families to other land.

Alteration in the character of Great Salt Lake was reported by Professor T. C. Adams of the University of Utah, in September. He stated that the lake had recently precipitated salt, forming a coat on the bottom. The increasing salinity of the water of the lake, incident to its shrinkage, was attributed to some years of less than the previously normal rainfall and to the diversion of some of the water flowing into it, for the use of cities and of farmers.

Officers. The chief officers of the State, serving in 1935, were: Governor, Henry H. Blood; Secretary of State, Milton H. Welling; Auditor, Julius C. Anderson; Treasurer, Joseph Ririe; Attorney-General, Joseph Chez; Superintendent of Public Instruction, Charles A. Skidmore.

Judiciary. Supreme Court: Chief Justice, Elias Hansen; Associate Justices, William H. Folland, Ephraim Hansen, David W. Moffat, James H. Wolfe.

UZBEK S.S.R. See SOVIET CENTRAL ASIA.

VANDERBILT UNIVERSITY. A nonsectarian institution of higher learning for men and women in Nashville, Tenn., founded in 1873. The enrollment for the autumn term of 1935 was 1542. The faculty numbered 370. The annual income was \$1,541,000. Volumes in the library numbered 143,000. Chancellor, James Hampton Kirkland, Ph.D.

VAN GOGH. See ART EXHIBITIONS.

VASSAR COLLEGE. A nonsectarian institution for the higher education of women in Poughkeepsie, N. Y., founded in 1861. The enrollment for the autumn of 1935 was 1224. The faculty numbered 172. The endowment amounted to \$8,600,000, the income from funds was approximately \$400,000. The library contained 196,200 volumes. President, Henry Noble MacCracken, Ph.D.

VATICAN CITY. A sovereign state, officially known as the State of Vatican City, established within the city of Rome as the seat of the Papacy on June 10, 1929, in accordance with the Italo-Vatican (Lateran) treaty of Feb. 11, 1929. Ruler in 1935, Pope Pius XI.

The area of Vatican City is 108.7 acres, including St. Peter's Square, and in addition 13 ecclesiastical buildings outside of its limits enjoy extra-territorial rights. It has its own coinage, import duties, railway station, and its postal, telegraph, and radio facilities. The census of Dec. 31, 1932, showed 1025 inhabitants, including 853 Italians and 121 Swiss, the latter mostly members of the papal gendarmery. Under the Constitution of June 7, 1929, the Pope exercises full legal, judicial, and executive powers. Executive authority was delegated by the Pope to a governor. Governor in 1935, Marquis Camillo Serafini. During the year Marquis Serafini carried through a complete reorganization of the civil government. A new broadcasting system and an enlarged observatory were inaugurated during 1935. See ROMAN CATHOLIC CHURCH.

VEGETABLES. See HORTICULTURE.

VENEZUELA. *vën'è-zwě'lä; Amer. Sp. pron., vā'nä-swä'lä.* A republic of South America, consisting of a Federal District, 20 States, and two Territories. Capital, Carácas.

Area and Population. Venezuela has an area estimated at 352,051 square miles and a population estimated on Dec. 31, 1934, at 3,324,160 (3,026,878 at the 1926 census). Carácas had about 143,147 inhabitants in 1934. Populations of the other cities

(1926) were: Maracaibo, 74,767; Valencia, 36,804; Nirgua, 36,836; Duaca, 28,719; Carúpano, 25,679; Río Caribe, 25,428; Barquisimeto, 23,109. Roman Catholicism is the prevailing religion.

Education. Primary education is nominally free and compulsory but about 57 per cent of the population is illiterate. In 1934 elementary education was provided in 1633 national, state, and municipal schools, each having one teacher; in 231 larger graded schools; in 127 one-teacher private schools, and 92 graded private institutes. The primary school enrollment (1933) was 121,035. For secondary education there were 47 schools, with 2040 pupils, and for higher education four colleges at Carácas (2), Maracaibo, and Mérida.

Production. Agriculture, stock raising, petroleum mining, manufacturing, pearl fishing, and exploitation of the forests are the principal industries. Production of the chief crops was: Coffee, 57,000 metric tons in 1933-34; cacao, 11,600 metric tons (exported) in 1933-34; cane sugar, 20,300 metric tons in 1933-34. Tobacco, cotton, corn, beans, and wheat are grown largely for domestic consumption. Forest products include balatá, tonka beans, divi-divi, and hardwoods. Production of the leading minerals in 1934 was: Petroleum, 20,112,115 metric tons (17,293,193 in 1933); gold, 3392 kilograms (2977 in 1933). Copper, magnesite, asphalt, and salt are other mineral products.

Foreign Trade. Imports in 1934 were valued at 159,685,860 bolívares (143,587,574 in 1933) and exports at 671,942,839 bolívares (617,546,684 in 1933). Petroleum and its products accounted for 608,431,509 bolívares of the total exports in 1934 (533,208,675 in 1933). In 1934 coffee exports were valued at 32,710,000 bolívares; cacao, 6,331,000; gold, 12,494,000. The principal imports are textiles, machinery, automobiles, drugs, and medicines, etc. The value of imports from the chief sources of supply in 1934 (in 1000 bolívares) was: United States and colonies, 72,155; Great Britain and colonies, 44,241; Germany, 11,287; the Netherlands and colonies, 7613; France and colonies, 6136. The distribution of 1934 exports was (in 1000 bolívares): the Netherlands and colonies (mostly petroleum), 500,789; United States and colonies, 107,736; Great Britain and colonies, 21,700; France and colonies, 11,514.

United States statistics for 1935 showed imports from Venezuela of \$21,428,443 (\$22,120,365 in 1934) and exports to Venezuela of \$18,584,054 (\$19,281,247 in 1934).

Finance. For the fiscal year ended June 30, 1934, government revenues totaled 171,829,000 bolívares and expenditures were 153,925,000 bolívares. For 1934-35 budget estimates were: Receipts, 148,650,000 bolívares; expenditures, 141,666,820 bolívares. For 1935-36 the estimates balanced at 164,594,000 bolívares, of which about 13,000,000 bolívares was to be used to retire all the outstanding internal debt and 10,000,000 bolívares to assist coffee and cacao growers. The treasury reserves on Apr. 15, 1935, amounted to 107,445,263 bolívares, an increase of 23,826,163 bolívares over the same date in 1934. With the retirement of its internal debt in 1935-36, Venezuela enjoyed the unique distinction of having no public indebtedness. The par value of the bolívar was \$0.19295.

Communications. Railway lines in 1934 extended about 750 miles; motor highways, about 3100 miles, open the year round; navigable waterways, 12,000 miles. Air lines connect the principal cities with the inter-American air network. The net tonnage of vessels entering Venezuelan ports

with cargo in the overseas trade during 1933 was 3,843,000. Due mainly to heavy oil shipments, the tonnage cleared was 11,068,000. The improvement of port works and extension of national motor highways proceeded actively during 1935.

Government. The Constitution of May 29, 1929, as amended in 1931, vested extensive executive powers in a President elected by Congress for seven years. Congress consists of a Senate of 40 members and a Chamber of Deputies of 85 members, all elected for three years. President in 1935, Gen. Juan Vicente Gómez, who as chief executive or commander-in-chief of the army had exercised undisputed control of Venezuela since 1908.

History. The death on Dec. 17, 1935, of Gen. Juan Vicente Gómez (q.v.), dictator of Venezuela for 27 years, launched the country upon a new era, fraught with imminent danger of a revival of the revolutionary plague which had kept the nation in almost perpetual turmoil before Gómez seized power in 1908. It had long been predicted that the passing of the iron-handed President would prove the signal for a struggle for power among his lieutenants and unleash the long-accumulated hatred of the populace against the henchmen through whom Gómez conducted his tyrannical régime. Immediately after the dictator's death, his cabinet designated Gen. Eleazar López Contreras, Minister of War, as Provisional President. The latter took immediate military precautions, at the same time freeing political prisoners and pledging that his government would liquidate the dictatorship and restore civil liberties and popular government. His prompt action was credited with preventing the subsequent riots and disorders from degenerating into a general civil war.

Popular resentment against various members of the Gómez clique who had achieved notoriety for their cruelty and exploitation boiled over on December 21, two days after the state funeral of General Gómez was held in Maracay. Severe rioting gripped Carácas, Valencia, Mérida, Cumana and various other towns. Gen. Eustaquio Gómez, cousin of the dictator, was shot to death, as were a number of other followers. Many others fled to Colombia and Trinidad. Properties of hated members of the Gómez régime were wrecked by mobs, including the offices of the newspaper *Nuevo Diario* and several theatres in Carácas. Rioting and looting was particularly widespread in Maracaibo, centre of the oil district, where enraged petroleum workers forced Gov. Vincencio Perez Soto of the State of Zulia to resign and menaced local merchants and foreign oil companies.

Gen. López Contreras checked the disorders by declaring martial law, establishing a strict censorship, and making numerous arrests. At the same time he took further steps to conciliate both public opinion and his more powerful rivals for the Presidency. On December 22 he decreed the appropriation of 30,000,000 bolívares for further subsidization of the distressed coffee industry. He also announced a large public-works programme under which laborers in the Carácas district were promised a wage of five bolívares a day. Numerous exiles who had fled abroad during the Gómez régime were invited to return.

On December 27 Gen. López Contreras announced that the government was in complete control of the situation. Congress met on December 31 and formally elected him to fill out the term of President Gómez, which was due to expire in April, 1936. Popular antagonism toward Congress, which had functioned as the servile tool of Gómez,

was manifested during the session of December 31. A shouting mob invaded the galleries, proclaiming that Congress was illegally elected, was sitting unconstitutionally, and that the members were all friends of the dead dictator. This and other manifestations of unrest as the year closed indicated that the López Contreras Government, handicapped by its close affiliations with the discredited Gómez régime, would have difficulty in perpetuating its control.

Developments of an economic and financial nature in 1935 were mainly favorable. Financially, the country was in excellent condition, with provision made for the retirement of the remaining public debt and the treasury reporting a substantial surplus and reserve. As in 1934, Venezuela's chief economic and financial problem was to check the appreciation of the bolivar relative to other currencies, a development which made it difficult for Venezuelan coffee and cacao producers to compete with similar products of depreciated-currency countries in foreign markets. To check this trend the government resorted to several mildly inflationary measures, such as placing in circulation 20,000,000 bolívares in silver newly minted at Philadelphia and increasing the note issue. Another subsidy of 10,000,000 bolívares was distributed among coffee and cacao growers to enable them to continue operations. A similar bounty was disbursed in 1934. Several new national industries, including a meat-packing plant and a dairy, were established with government aid. The extensive programme of public works was continued.

VERMONT. Population. On Apr. 1, 1930 (Fifteenth Census), 359,611; July 1, 1934 (latest Federal estimate), 361,000; 1920 (Census), 352,428. Burlington had (1930) 24,789 inhabitants; Montpelier, the capital, 7837.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934.

Crop	Year	Acreage	Prod Bu	Value
Hay (tame) . . .	1935	919,000	1,119,000*	\$11,526,000
	1934	913,000	948,000*	17,254,000
Corn	1935	72,000	2,880,000	2,304,000
	1934	67,000	2,814,000	2,786,000
Potatoes	1935	16,000	1,840,000	1,472,000
	1934	16,000	2,720,000	1,251,000
Apples	1935	.. .	708,000	814,000
	1934	.. .	255,000	400,000

* Tons

Education. The number of inhabitants aged between 6 and 18 years was stated, for the academic year 1934-35, as 77,774. The enrollments of pupils in the public schools totaled 65,533. Of these, 52,793 were in elementary schools and 12,740 in high schools. The expenditure of the year, for public-school education in the State, totaled \$4,409,251. The year's salaries of teachers averaged, for those in high schools, \$1233.03; in graded positions, \$925.86; in rural schools, \$635.80; in elementary positions, \$754.69.

In accordance with the suggestion of an educational commission the division of the State into districts for supervision of public schools was altered in such manner as to do away with the need for superintendents working on partial time. The yearly period of operation of elementary schools was lengthened to 35 weeks, from 34. The minimum salary for teachers was increased. The sum contributed yearly by the State for the support of public schools was augmented by about 50 per cent, and the system for distributing State aid was changed, so as to make the grants accord with

standards of need and ability. A fourth year was added to the course provided in the State Normal School at Castleton.

Legislation. A measure for the creation of a system of pensions for the aged was enacted. It was designed to conform with the Federal requirements and qualify the State to receive the subventions to such pensions, provided in the Federal Social Security Act.

Political and Other Events. The State ceased to receive from the Federal Government the grants made through the FERA toward the support of the needy unemployed. Its own system for aiding this class by payments of public money had come to an end by the expiration of its statutory term in December, 1934. In that year the cost of such aid in the State totaled \$2,010,019, of which the FERA had paid \$1,221,191, and subdivisions of the State \$765,728. The total payment fell below the yearly rate of \$6 per capita of the population, which was less than half the rate for the country as a whole.

The State Supreme Court held the State's tax on chain stores, at rates graduated according to the number of stores owned by the same firm, to be unconstitutional. The tax had been enacted in 1933, and was estimated to supply some \$200,000 a year to the State treasury.

Officers. The chief officers of the State, serving in 1935, were: Governor, Charles M. Smith, Lieutenant-Governor, George D. Aiken; Treasurer, Thomas H. Cave; Secretary of State, Rawson C. Myrick; Auditor, Benjamin Gates; Attorney-General, Lawrence C. Jones; Commissioner of Education, Francis Bailey.

Judiciary. Supreme Court: Chief Justice, George M. Powers; Associate Justices, Leighton P. Slack, Sherman R. Moulton, Frank D. Thompson, John C. Sherburne.

VERMONT, UNIVERSITY OF, AND STATE AGRICULTURAL COLLEGE. An institution of higher education in Burlington, Vt. The University of Vermont, founded in 1791, and the Vermont Agricultural College, founded in 1864, were combined in 1865 as the University of Vermont and State Agricultural College. The 1935 autumn enrollment was 1245; the summer school enrollment, 986. The faculty numbered 186. The endowment amounted to \$3,053,151, while the income for the year was \$1,189,093. The library contained 140,000 volumes. The Mabel Louise Southwick Memorial building was opened during the year. President, Guy W. Bailey, LL.D.

VETERANS. See UNITED STATES under *Administration*.

VETERINARY MEDICINE. In the field of comparative medicine the year 1935 was marked by the unprecedented advance made in the eradication of bovine tuberculosis and the commencement of nation-wide control work with infectious abortion and with mastitis of cattle. The year saw the entrance of none of the dreaded diseases of livestock prevalent in various parts of the world not heretofore present in the United States.

Bang's Disease Eradication. The eradication work with bovine infectious abortion commenced in July, 1934 (See YEAR BOOK, 1934, p. 730) was extended to the 48 States. Of 5,125,700 cattle in 339,500 herds tested by the first of November about 531,000 in 35 per cent of the herds gave positive reactions to the blood test and were removed for slaughter. In five States led by Oregon with 40.96 per cent the dairy and beef cattle under supervision now exceeds 20 per cent and in 19

States the proportion is 5 per cent or less. Re-tests of the reacting herds indicated that good progress is being made by the method employed in the elimination of this disease, which has been estimated to take an annual toll from the livestock industry of the United States of \$50,000,000. The progress of the work was reported upon in August by Dr. A. E. Wight, director in charge (*Journ. Amer. Vet. Med. Ass'n*, 87, p. 290). A whole-blood stained-antigen test for the presence of the infection, similar to that developed for the detection of pullorum disease in the fowl, was used experimentally in field work with encouraging results.

Encephalomyelitis, Equine. Research work was continued with this brain disease of the horse and mule (see YEAR BOOK 1934, p. 730), the filtrable virus of which was demonstrated as present in cases in 7 States additional to the 8 States from which it had previously been recorded. There are 15 other States from which the disease has been diagnosed clinically. Aside from a moderate outbreak in Virginia the four States in the East originally infected had relatively little or no infection in 1935. A new centre of infection of small proportions was found in North Carolina. The Western virus was responsible for a great extension of the disease in other sections of the country, particularly severe outbreaks having occurred in Minnesota, North and South Dakota, and Idaho. There was estimated to have been at least 25,000 cases of the disease during the year's outbreak. Nine States used formol-killed brain tissue vaccine as an intended prophylactic in the field. The work indicated that the differences between the Eastern and Western types of the virus may be only different degrees of virulence rather than immunological dissimilarity. In transmission work with the Western virus it was discovered that a period of four to five days must elapse after the feeding of the mosquito, either on an infected guinea pig or on brain containing the virus, before the disease is transmitted by biting, after which time transmission regularly results for a period of about two months. The yellow fever mosquito failed to transmit the Eastern type of the virus.

Fluorine Toxicosis of Dairy Cows. Investigations in Wisconsin extending over a number of years have shown that very small amounts of fluorine are exceedingly toxic to the animal organism when fed over long periods of time and that the use of materials containing appreciable quantities of fluorine cannot be used without disastrous results. The importance of this finding is emphasized by the knowledge that crude rock phosphate contains 3.5 to 4 per cent of fluorine and that superphosphate may contain 0.5 to 2 per cent, 90,000 tons of fluorine being added to the top soil annually in the United States through the use of superphosphate fertilizers.

Influenza and Distemper. In investigational work the filtrable virus of human and of swine influenza have both been found to be transmissible through the respiratory tract to ferrets and mice. The fact that the influenza virus of man induces an immunity in ferrets against the distemper virus of dogs has suggested a possible relationship between the disease in man and dogs.

Mastitis of Dairy Cattle. With the sum of one million dollars allotted from Federal emergency funds the work of eliminating marked physical cases of mastitis from dairy herds required to meet strict municipal ordinances was commenced

in January. Funds were allotted to all the States but the largest amounts went to those located in what is known as the New York milkshed. By the end of June physical examinations for mastitis had been made in 3808 herds containing 94,919 cows of which 11,683 were found affected and removed. The average Federal payment was \$29.87 and the average salvage \$31.73. The owners of the herds were required to sign an agreement to attempt to control the disease and also to participate in the Bang's disease control programme.

Paralysis of the Fowl. Investigations of the devastating fowl paralysis for which no specific treatment is known, conducted in Florida, led to the conclusion that the bacterium *Salmonella aertrycke* plays an important part in its causation.

Parasite Control, Livestock. The administration of carbon tetrachloride in gelatin capsules to ten weeks old chickens at the rate of 4cc. per kilo of body weight was found to be 100 per cent effective in removing the fowl roundworm and practically free from toxic effects. An investigator in England reported that the more serious effects of roundworm infestation of sheep and lambs grazing on permanent pasture can be prevented by the repeated administration of large doses of a 5 per cent solution of copper sulphate containing 5 per cent of a 40 per cent solution of nicotine sulphate. The drug foudadin was used against infestations of the dog heartworm (*Dirofilaria immitis*) with quite satisfactory results.

Respiratory Affections of the Fowl. A severe type of coryza that has appeared among chickens was under investigation in several States, the causative bacterium having been isolated. The respiratory disease clinically similar to infectious laryngotracheitis but immunologically distinct which has appeared in various sections of the country was the subject of investigation in a number of States. Preventive work with infectious laryngotracheitis led to an improved method of vaccination. Observations indicate that chickens cease to be carriers of the virus in about one week after having been vaccinated against it.

Sheep Scabies Eradication. In the work of sheep scabies eradication only a few scattered cases were found in the great range areas of the West and Southwest, these having been in Arizona, New Mexico, and Texas. The entire range originally quarantined appeared to be free from the disease. The principal centres of infection in 1935 were in South Dakota, Iowa, and Ohio. During the year 16,295,011 inspections were made in the field and 1,490,450 dippings supervised.

Tick Fever and Cattle Tick Eradication. The cattle tick eradication work during the fiscal year ended June 30 resulted in the release of an area of 12,852 square miles in Florida, Louisiana, and Texas from quarantine. In the course of the work 27,550,801 inspections or dippings of cattle and 2,734,249 of horses and mules were conducted. At the close of the fiscal year all but 9 per cent of the area (730,000 sq. miles) in 15 States placed under quarantine at the commencement of the work on July 1, 1906, had been released. Assistance was received from the Federal Emergency Relief Administration agencies of the States.

Tuberculosis Eradication, Bovine. The remarkable progress that has been made in the eradication of tuberculosis from the dairy and beef herds of the nation is far reaching as a public health measure as is well illustrated by the fact that in the State of Pennsylvania the human death rate from all forms of the disease other than pul-

monary has been reduced more than one half since the work was commenced. Fifteen States with more than 600 counties were added during the calendar year making 33 States with a total of approximately 79 per cent of all the counties in the United States that have practically eradicated tuberculosis from their herds.

This progress was made possible by the Federal appropriation of \$4,042,179 for the fiscal year ended June 30 and an emergency fund of \$13,750,000 for the 17 months ended December 1. The combined State and county appropriations were approximately \$9,000,000 for the year ended June 30. Approximately \$7,000,000 of Federal funds and \$6,000,000 of State funds were used for indemnity the average appraised value of reactors having been \$57.55. In the course of the work 25,237,532 tuberculin tests were applied to cattle of which 376,623 or 1.5 per cent were reactors. At the end of the fiscal year 5,590,863 herds containing 48,768,627 cattle were under supervision for eradication of the disease. In 43 States more than 50 per cent of the cattle were under supervision. During the course of the work which was commenced in 1917 a total of 155,527,683 head of cattle have been tested of which 3,302,561 have reacted and been removed for slaughter. The eighth survey conducted to determine the approximate extent of bovine tuberculosis in the various Counties of the United States which was completed May 1 indicated that the infection among cattle had been reduced to 0.6 per cent as compared with 4.0 per cent found in the first survey made in 1922.

A summary of the eradication work in Canada that is being conducted along lines quite similar to those followed in the United States, prepared by Lt. Col. T. Dunlop-Young, appeared in November (*Vet. Journ.* 91, p. 459). At the close of March there were 6790 herds fully accredited as free from tuberculosis, a total of 4,007,130 animals having been tested, with 2,251,771 under supervision. In recognition of the progress made in Canada the United States commenced on August 1 to admit all cattle from modified-accredited areas—areas in which the disease had been reduced to less than one half of 1 per cent, without further tuberculin testing.

Necrology. The year saw the passing of Dr. Marion Dorset at Washington, D. C. on July 14 at the age of 62. Dr. Dorset, who had served as Chief of the Biochemic Division of the Federal Bureau of Animal Industry since 1904, was best known for his work in the development of anti-hog cholera serum and the improvement and preparation of tuberculin used in the tuberculosis eradication campaign. Dr. Charles A. Cary, a past president of the American Veterinary Medical Association and dean of the College of Veterinary Medicine in Alabama from its organization in 1906, died on April 23 at the age of 74.

Bibliography. Works of the year include: E. H. Barger and L. E. Card, *Diseases and Parasites of Poultry* (Philadelphia, 1935); H. E. Dukes, *The Physiology of Domestic Animals*, (Ithaca, N. Y., 1935, 3d rev.); L. A. Merrill and D. M. Campbell, *Veterinary Military History of the United States, with a Brief Record of the Development of Veterinary Education, Practice, Organization and Legislation*, (Kansas City, Mo., 1935, 2 vols.); W. C. Miller (editor), *Black's Veterinary Dictionary*, (London, 1935, 2d ed. rev. and enl.); R. A. Runnells, *A Guide to the Study of Special Veterinary Pathology*, (Ames, Iowa, 1935); H. P. Hoskins (editor), *Proceedings*

Twelfth International Veterinary Congress, (Washington, D. C., 1935, 3 vols.); G. H. Wooldridge (editor), *Encyclopædia of Veterinary Medicine, Surgery and Obstetrics*, (London, 1935, 2 vols. 2d ed.).

VICTORIA. A State of Australia. Area, 87,884 sq. miles; population (Mar. 31, 1935), 1,839,363 exclusive of 596 (1933 census) aborigines (510 half-caste and 86 full-blood). During 1934 there were 27,828 births, 18,648 deaths, and 13,862 marriages. Chief towns (with 1933 census populations): Melbourne (capital), 992,048; Geelong, 39,225; Ballarat, 37,409; Bendigo, 29,131.

Production. The chief agricultural crops were wheat, oats, barley, potatoes, hay, and grapes. Live-stock in the State (Mar. 31, 1935): 16,783,631 sheep, 2,085,080 cattle, 357,877 horses, 265,006 pigs. Production (1933-34): Wool, 161,146,436 lb.; butter, 134,942,177 lb.; cheese, 8,363,233 lb.; bacon and ham, 17,935,453 lb.; wheat (1934-35), 25,850,528 bu. The total value of mineral production for 1934 was £1,091,864 of which gold accounted for £597,040; coal, £479,605; and tin, £3886. In 1933-34 there were 8896 factories, with 156,334 employees, from which the value of production was £44,201,645.

Government. For the year ended June 30, 1935, revenue amounted to £25,328,000; expenditure, £25,498,000; public debt (June 30, 1934), £172,972,000 (Australian £ averaged £4.0095 for 1934; \$3.8755 for May, 1935). Executive power was vested in a governor. Legislative power was vested in a parliament consisting of the legislative council (Upper House) of 34 members elected for six years, and the legislative assembly (Lower House) elected for three years. As a result of the election of Mar. 2, 1935, the numerical strength of the political parties in the legislative assembly was: 25 United Australia, 20 Country, 17 Labor, and 3 Independent. Governor in 1935, Lord Huntingfield; Premier, A. A. Dunstan. See AUSTRALIA under History.

VILNA. See POLAND and LITHUANIA under Area and Population and History.

VIRGINIA. Population. On Apr. 1, 1930 (Fifteenth Census), 2,421,851; July 1, 1934 (latest Federal estimate), 2,446,000; 1920 (Census), 2,309,187. Richmond, the capital, had (1930) 182,929 inhabitants; Norfolk, 129,710.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1935	1,534,000	39,884,000	\$29,913,000
	1934	1,461,000	35,794,000	31,141,000
Hay (tame)	1935	976,000	1,113,000*	12,911,000
	1934	960,000	948,000*	14,410,000
Tobacco	1935	117,100	95,500,000*	17,860,000
	1934	102,300	80,155,000*	18,380,000
Potatoes	1935	88,000	11,352,000	6,811,000
	1934	101,000	13,433,000	7,791,000
Apples	1935	16,695,000	10,017,000
	1934	9,275,000	8,069,000
Wheat	1935	601,000	8,714,000	7,581,000
	1934	578,000	8,092,000	7,768,000
Peanuts	1935	153,000	160,650,000*	5,141,000
	1934	147,000	147,000,000*	5,145,000
Cotton	1935	53,000	30,000*	1,696,000
	1934	58,000	35,000*	2,112,000
Sweet potatoes	1935	35,000	4,060,000	2,233,000
	1934	34,000	3,910,000	2,972,000

* Tons. * Pounds. * Bales

Education. For the academic year 1934-35 the number of the inhabitants of school age was reckoned as 731,043. Enrollments of pupils in the public schools totaled 590,532. Of these, 479,650 were in

common schools or elementary grades, and 110,-882 were in high schools. The year's expenditures for public-school education in the State amounted to \$22,777,328. The teachers' yearly salaries (supervisors and supervising principals excluded) averaged \$730.

Charities and Corrections. The State Emergency Relief Administration, while it continued to distribute to the destitute unemployed the support supplied chiefly by Federal grants, prepared to give up its task as soon as the aid for this class should have been shifted entirely to the basis of wages paid for work on public undertakings and to the management of the Federal WPA.

The ordinary work of the State government in dealing with dependency, correction, and the defective class remained under the central authority of the State's Department of Public Welfare. This Department, headed by a Commissioner (Arthur W. James), included divisions severally covering child welfare, mental hygiene, service to veterans, mothers' aid, finance and statistics, organization and supervision, and institutions and inspection. The State industrial schools were controlled by boards of their own, but the Commissioner was a member of these boards, *ex officio*. Boards of directors of the State prisons and hospitals were associated with the Department. It also exercised supervision over children committed to State institutions or agencies, licensed and inspected institutions, and agencies of child welfare, inspected all institutions for the care or custody of persons, aided the development of local services in that field, investigated applications for pardons, and handled the State's system of mothers' aid and its services to veterans.

Political and Other Events. The State's accounts as of the close of its fiscal year on June 30 showed a balance of \$585,560 of revenue over expenditure. The showing was due in part to the successful operation of the State's monopoly of the sale of liquor at retail. In part also it could be ascribed to the State government's not having had to make any considerable appropriation to the cost of support for the indigent unemployed. This cost had run far below the average per capita for the nation in 1934 and tended to decrease in 1935. The total paid for public support to the unemployed in Virginia in 1934 was reported by the FERA as \$7,682,257; this came to some \$3.15 *per capita* of the State's population, or somewhat over one-fourth of the figure for the entire country. The FERA paid 87.7 per cent of the cost in the State.

The State still held at the end of May, 1935, some 50,000 families and single individuals dependent on the dole. Their total was made up mainly of industrial workers in cities; the condition of agriculture as a whole was described as satisfactory. Senator Byrd, to whose influence was ascribed the State's not having made any appropriations toward sharing the costs of the FERA, and Governor Peery organized job-finding committees to stimulate the reemployment of the idle by a campaign during the summer.

Officers. The chief officers of the State, serving in 1935, were: Governor, George C. Peery; Lieutenant-Governor, James H. Price; Secretary of the Commonwealth, Peter Saunders; Treasurer, A. B. Garthright; Auditor, S. McCarthy Downs; Attorney-General, Abram P. Staples; Superintendent of Public Instruction, Dr. Sidney B. Hall.

Judiciary. Supreme Court of Appeals: President, Preston W. Campbell; Associate Justices, John W. Eggleston, H. W. Holt, E. W. Hudgins,

H. B. Gregory, George L. Browning, Joseph W. Chinn.

VIRGINIA, UNIVERSITY OF. A nonsectarian institution of higher education at Charlottesville, Va., founded in 1819. The enrollment for the autumn session of 1935 was 2368. In the extension division were 1264 students. The 1935 summer session had an attendance of 1458. The faculty numbered 148. The productive endowment amounted to \$10,000,000. The library contained approximately 270,000 books. The Thornton Hall of Engineering was completed and opened in 1935, and an addition to the hospital was nearing completion. President, John Lloyd Newcomb, D.Sc., LL.D.

VIRGIN ISLANDS. An insular possession of the United States, consisting of 50 small islands situated about 60 miles east of Puerto Rico in the Caribbean Sea. The chief islands are St. Thomas (area, 28 sq. miles; population, 9834 in 1930); St. Croix (area, 84 sq. miles; population, 11,413 in 1930); and St. John (area, 20 sq. miles; population, 765 in 1930). Total area, 132 square miles; population in 1930, 22,012 (26,051 in 1917). St. Thomas, the capital, had 7036 inhabitants in 1930. Negroes comprised 78 per cent of the 1930 population, 12 per cent were of mixed race, and 9 per cent were white. The birth rate in the calendar year 1934 was 29.8 per 1000 inhabitants (26.3 in 1933) and the death rate was 19 per 1000, the lowest rate on record, against 21.9 per 1000 in 1933. The 1930 census showed that 16.1 per cent of the adult population was illiterate. Enrollment in the public schools was 3460 in 1934-35, including 638 in high-schools. Seven new school buildings were completed with the aid of PWA grants in 1934-35.

Production, etc. The principal industries are the production of sugar and bay rum, cattle raising, the bunkering and supplying of ships, and local handicrafts. These sources of income were supplemented by a rapidly growing tourist trade following the opening of the government-owned Bluebeard Castle Hotel in St. Thomas on Christmas Day, 1934. Sugar production in 1934-35 was 1670 tons (4088 in 1933-34); rum, 250,000 gal.; cattle (exports), 2271 (1818 in 1933-34). Sales of the handcraft coöperatives of St. Thomas and St. John totaled \$23,372 (exclusive of hooked rugs) in 1934-35; hooked rugs, \$5487. In the calendar year 1935 imports from the United States were \$1,666,415 (\$1,544,424 in 1934) and exports to the United States were \$489,126 (\$575,052 in 1934). During 1934-35 549 ocean-going ships, with a total gross tonnage of 2,568,452 tons, entered the harbor of St. Thomas. This was 38 ships more than in 1933-34 and 44 ships more than the preceding 15-year average of 505. The bunkering of ships also showed a 37 per cent increase due to the removal of harbor dues. Dredging and other improvements to the port were under way. A weekly air service connected St. Thomas with the Pan American Airways network at San Juan, Puerto Rico.

Government. The Virgin Islands are administered through the Department of the Interior. Executive power under the Organic Act of Mar. 3, 1917, is vested in a governor appointed by the President of the United States. Full American citizenship was granted the natives by the Act of Feb. 25, 1927. The two administrative units are the Municipality of St. Thomas and St. John and the Municipality of St. Croix. Each has a legislative body (Colonial Council), of 15 and 18 members, respectively, with a minority of the members appointed by the Governor and the remainder elected by restricted suffrage. Gov. Paul M. Pearson

resigned in 1935 and on July 23, 1935, Lawrence W. Cramer, the Lieutenant-Governor, was appointed to succeed him.

Revenues of the two municipalities in 1934-35 totaled \$272,917 (\$225,562 in 1933-34) and expenditures totaled \$463,022 (\$377,320 in 1933-34). Federal appropriations made available to the Virgin Islands during 1934-35 totaled \$364,023, the lowest figure since 1930. However, additional grants of \$376,680 were made by the Washington authorities under the National Recovery Programme. Expenditures under the National Recovery Programme totaled \$893,514, the excess of expenditures over grants being covered by unexpended balances from the previous year.

History. The violent political controversy which raged in official circles in the Virgin Islands during 1934 developed in intensity in the first half of 1935. It resulted in an investigation by the Senate Committee on Territories and Insular Affairs under Senator Tydings and finally in the intervention of President Roosevelt, who on July 23 transferred both Governor Pearson and District Judge T. Webber Wilson from their posts in the Virgin Islands to new positions on the mainland. Lawrence W. Cramer, who as Governor Pearson's assistant had been Lieutenant Governor of St. Croix since 1931, was appointed to the governorship and Judge Albert Levitt was appointed by Attorney General Cummings to succeed Judge Wilson. Mr Cramer's inauguration on August 31 was followed by a marked recession of the violent passions aroused among the islanders, which had threatened to result in serious civil disorders.

Partisan opposition to Governor Pearson and his associates, who were holdovers from the Hoover Administration, and the hostility of the ruling class of island property owners and business men to the Governor's rehabilitation programme were apparently the principal causes of the political tempest. In this struggle, marked by unconfirmed charges of corruption and inefficiency against Mr Pearson and counter-charges of obstruction and of petty partisanship leveled at Judge Wilson, the Pearson administration enjoyed the staunch support of Secretary of Interior Ickes while the opposition forces in the Islands were supported by Democratic spokesmen in Congress. The arrival in the Islands in May of investigators for the Senate committee proved the occasion for riotous demonstrations by opponents and supporters of the Governor and for scenes of partisan fury in the Colonial Councils. The local anti-Pearson journal, the *Liberator*, was sued for libel by the Insular Government following its statement that officials had intimidated witnesses at the hearings. Hearings before the Senate Committee were in full swing in Washington, with Secretary Ickes demanding an opportunity to be heard and accusing the committee of attempting to "whitewash" Judge Wilson and his allies, when President Roosevelt finally intervened. His appointment of Mr. Cramer was made on the recommendation of Secretary Ickes.

The President took a further step designed to end unrest and agitation on the Islands through an executive order issued August 22 which authorized the Governor to administer the reconstruction programme already under way. He thus gave notice that there would be no interference with the far-reaching plans launched by the Pearson Administration for the rehabilitation of the islands through various government-owned and cooperative enterprises. The revival of the sugar and rum industries on St. Croix consequently was contin-

ued by the Virgin Islands Co., a nondividend corporation established with Federal funds, whose profits or savings were to be redistributed to the people in the form of social security and welfare legislation. The settlement of homesteaders on small farm plots purchased by the government from large landowners also proceeded. By June 30, 1935, 255 such homesteads had been established in St. Croix and about 60 in St. Thomas. The new Virgin Islands National Bank, organized with funds supplied by the Reconstruction Finance Corporation to take the place of the retiring National Bank of the Danish West Indies, opened its doors on May 1, 1935. Further aid to the Island of St. Thomas was extended through the decision of the Navy Department to establish a marine air base there and to maintain a naval training ship in the harbor.

Consult Ralph Thompson, "The Promise of the Virgin Islands," *Current History*, March, 1935, and Luther Harris Evans, "Unrest in the Virgin Islands," *Foreign Policy Reports*, Mar. 27, 1935.

VITAL STATISTICS. In its provisional summary of mortality statistics in the United States, the Bureau of Census announced that in 1934 the number of deaths from all causes rose from 1,342,073 as reported in 1933 to 1,396,903, representing a mortality rate of 11.0 per thousand estimated population as against 10.7 per thousand in 1933.

The table on page 750 gives the number of deaths and the death rate in each year from 1932 to 1934, inclusive, for each cause according to the titles of the International List of Census of Deaths. Of the 18 groups of causes of death into which this table is divided, 11 show increases in rates as compared with the previous year, 5 show decreases, and 2 show virtually no change. The cause, "diseases of the circulatory system," showing a pronounced increase in each of the past several years, has shown another sharp rise, with several causes within this group having similar marked increases.

The most marked decrease in major causes are those arising from "infectious and parasitic diseases," with declining rates in poliomyelitis and tuberculosis contributing the major parts. Cancer not only continues in third place in the major division of causes, but has shown a marked increase in rate. Though the cause, "violent and accidental deaths," shows a sudden rise over the previous two years, it is nevertheless slightly lower than in 1931, with 1047 deaths per hundred thousand of estimated population. A supplemental table, not included herein, shows that accidents in which automobiles were the primary cause of death, rose to a total of 33,980 in 1934, as compared with 29,323 in 1933, and with 20,350 in 1932.

VOLK, (STEPHEN ARNOLD) DOUGLAS. An American painter, died at Fryeburg, Me., Feb. 7, 1935. The son of Leonard Volk, he was born at Pittsfield, Mass., Feb. 23, 1856, and received his art education at St. Luke's Academy, Rome and at the École des Beaux Arts, Paris, where he studied under Gérôme. In the Paris Salon of 1875 he exhibited "In Brittany," and in that of 1878, his portrait of Miss Tuttle.

Upon his return to America in 1879, he became an instructor at Cooper Institute, New York, where he remained until 1884. Two years later he went to Minneapolis where he organized the Minneapolis School of Fine Arts. During this period of his career he painted many colonial subjects, in-

DEATHS AND DEATH RATES IN THE UNITED STATES REGISTRATION AREA, 1934, 1933, 1932

Cause of death	Number of deaths			Rate per 100,000 estimated population		
	1934	1933	1932	1934	1933	1932

cluding "The Puritan Maiden" (1881), "The Puritan Captives" (1882), and "Accused of Witchcraft" (1884), the latter being in the Corcoran Gallery at Washington. In 1893 he was back in New York and became an instructor at the Art Students' League. He remained with this school until 1898. He also taught at Cooper Union from 1906 to 1912, and at the National Academy of Design from 1910 to 1917. He served on the art jury at the Chicago World Fair, where several of his own works were exhibited, in 1893.

Mr. Volk first started as a landscape painter and later in his life turned to portrait painting, for which he is better known, although his landscapes

show a marked skill. A conservative of the conservatives, his work had nothing in common with the modern trend, and his paintings were good in drawing, carefully composed, and pleasing in color. His many portraits of Lincoln indicated a remarkable knowledge of the man's character, physique, and lineaments, and one of his better portraits of the Emancipator was acquired by the Albright Art Gallery, Buffalo, N. Y., in 1923.

Good examples of Volk's work, which is to be found in most American public collections, include: Portrait of his wife and son, the Carnegie Museum, Pittsburgh; "The Young Pioneer," a portrait of Felix Adler, and "Little Mildred," all in the Met-

ropolitan Museum, New York; "Boy with Arrow," National Gallery, Washington; "Among the Lilies," National Arts Club, New York; "Puritan Mother and Child," Carnegie Institute, Pittsburgh. Among his mural decorations are those of "Father Hennepin" and "The Battle of Missionary Ridge" in the Minnesota State Capitol at St. Paul, and "The Trading Post" in the Des Moines, Iowa Courthouse. His portraits of King Albert, General Pershing, and Lloyd George, which were painted from life, are in the collection of World War heroes in the National Gallery, Washington.

He was elected a member of the National Academy in 1899 and of the Architectural League in 1912, and received many prizes and awards, including medals at expositions in Chicago (1893), Buffalo (1901), St. Louis (1904), and San Francisco (1915); Proctor portrait prize (1910); Salus Gold Medal, National Academy of Design (1911); Gold medal of National Arts Club (1915), and the Beck gold medal of the Pennsylvania Academy of Fine Arts (1916). In 1920 he was made an officer of the Order of Leopold II, and his views on art education were printed in *Art Education in the Public Schools*.

VORARLBERG. See AUSTRIA.

VOS, vös, HUBERT. An American portrait and genre painter, died in New York City, Jan. 8, 1935. Born in Maestricht, Holland, Feb. 17, 1855, his talent attracted the attention of Hean Portaels, president of the Brussels Royal Academy, who persuaded him to study art, with the result that Vos entered the Academy. He remained there for two years, when the Dutch Government financed his studies in Rome. Subsequently, he studied under Ternan Cormon.

He first exhibited at the Paris Salon of 1886, where his painting, "A Room in a Brussels Alms-house" was awarded a gold medal. This work was later acquired by the Maestricht Town Hall. In the Salon of 1890 he exhibited "Portrait of the Russian Ambassador" and "Angelus on the Zuyder Zee," which won a gold medal. Other awards received during the course of his career were a gold medal at Munich for "Pauvre Gens," and a *diplome d'honneur* at Dresden for a pastel done in Ireland representing "Home-Rulers."

In 1892, Mr. Vos was sent by the Dutch Government to Chicago as the Art Commissioner for Holland at the World's Fair. For a time he lived in London, but so well did he like America that he subsequently returned and became a citizen. It was while at the Fair that he conceived the idea of a world tour to study aboriginal peoples. About 40 canvases resulted from this tour and they were exhibited throughout the world.

A portrait painter of distinction, his work, a combination of the Dutch and Flemish schools, was characterized by an ability to bring out the man rather than merely a face, and he became known as a painter of psychological studies. He painted many Eastern rulers, including Yuan Shih-kai, first president of the Chinese Republic, the Emporer of Korea, and the Dowager Empress of Japan (1905). Other portraits were of three generations of the Wadsworth family, Lewis Nixon, Judge and Mrs. Elbert H. Gary, Mrs. Jay Gould, Arthur Curtiss James, and Hugh D. Auchincloss, the last completed in 1934. Also, he did some still life paintings of Chinese porcelains, one of which is in the Luxembourg.

Mr. Vos was a member of the Royal Society of British Artists, and a founder of the Society of

Pastellists and the Society of British Portrait Painters.

WAKE ISLAND. An isolated island in the Pacific 2130 miles west of Hawaii, owned by the United States since 1899. It is a typical coral atoll, with a shallow, enclosed lagoon. Mangrove trees in the tidal flats and other shrubs provide ample fuel for distilling fresh water. The total land area is about 2600 acres, lying about 10 to 15 feet above sea level. During 1935 the island became a base for the transpacific air service of Pan American Airways. The island was placed under the administration of the U.S. Navy Department by an executive order in January, 1935. There were 26 men on the island, including six members of the airport staff, when regular air service was inaugurated late in November. See AERONAUTICS under *Trans-Oceanic Air Service*.

WAR. See BOLIVIA, CHINA, ETHIOPIA, INDIA, and the various European countries under *History*; MILITARY PROGRESS; NAVAL PROGRESS.

WASHBURN COLLEGE. A coeducational institution in Topeka, Kan., founded in 1865. The enrollment for the autumn session of 1935 was 874. There were 70 faculty members. The endowment was \$1,192,911, and the income for the year \$193,470. The library contained approximately 40,000 volumes. President, Philip C. King, D.D.

WASHINGTON. Population. On Apr. 1, 1930 (Fifteenth Census), 1,563,396, July 1, 1934 (latest Federal estimate), 1,608,000; 1920 (Census), 1,356,621. Seattle had (1930) 365,583 inhabitants; Spokane, 115,514, Tacoma, 106,817; Olympia, the capital, 11,733.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934.

Crop	Year	Acreage	Prod Bu	Value
Wheat	1935	1,994,000	45,577,000	\$30,992,000
	1934	1,883,000	37,346,000	27,211,000
Apples	1935	31,390,000	21,973,000
	1934	33,000,000	24,750,000
Hay (tame) ..	1935	898,000	1,741,000 ^a	14,450,000
	1934	901,000	1,795,000 ^a	15,796,000
Potatoes ...	1935	38,000	6,270,000	4,389,000
	1934	45,000	7,290,000	3,937,000
Oats	1935	196,000	9,408,000	3,011,000

Corn	1935	32,000	1,200,000	900,000
	1934	34,000	1,122,000	920,000

^a Tons. ^b Pounds.

Education. The enrollments of pupils in the public schools during the academic year that ended with June 30, 1935, numbered 335,771, a total somewhat less than that for the year previous. Of the year's enrollments, 4228 were in kindergartens; 232,069, in the elementary grades; 99,474, in high schools, exclusive of postgraduate students. The current expenditures of the year, for public-school education, amounted to \$20,529,270; the total expenditures, outlay and service of debt included, to \$23,254,707. Both totals were substantially higher than the corresponding ones for the year before.

The year's salaries of the teachers averaged \$1256; this average exceeded the previous year's by 4 1/4 per cent.

Legislation. The regular session of the Legislature enacted a tax of 2 per cent of the paid price on retail sales of merchandise. In order to remove the temptation for the inhabitants to cross the border and make purchases in Oregon tax-free, it included in its Revenue Act a provision taxing, also at 2 per cent of cost, goods bought outside of the State and brought in. An effort was made to escape the Federal constitutional prohibition of the levying of duties by States on imports into their territory; the levy was called "a tax or excise for the privilege of using within the State any article . . . purchased." The law went into effect on May 1.

A system of insurance against unemployment was created, with a view to qualifying the State for the Federal subventions to State systems of this character, under the terms of the Federal Social Security Act. In order to meet the payment of the State's share of the specified allowances to persons who had lost employment, the law imposed on employers the continuous payment of a tax at the rate of 3 per cent of their payrolls. The proceeds were to pass into a central fund available for allowances to the unemployed. The act was permissive as to the creation of this system; it was designed to go into effect when the Federal enactment had been completed.

The State's laws to restrain the practice of "birth control," as by restricting the sale of articles for that purpose, were repealed.

Political and Other Events. The grants of Federal money toward the support of the needy unemployed in the State were suspended on March 1, to compel the State to contribute to that purpose the part of the cost demanded by the FERA. For 1934 the total cost of this support, as reported by the FERA on Mar. 1, 1935, had been \$16,685,177, of which the FERA had met 82 1/2 per cent. The total for that year came to some \$10 1/3 per capita of the State's population, as against a corresponding rate of about \$12 for the entire nation.

In order to collect the State's new sales tax to the nearest fifth of a cent the State Tax Commission issued in April 1,000,000 token coins made of aluminum and bearing each the face value of 1/5 cent. Some of the banks refused to handle these coins, judging that as the Constitutional monopoly of coinage rested in the Federal Government, the tokens could not be classed as money. The State Supreme Court, on the other hand, ruled in August that the tokens might be used in continuous circulation; the number of those issued was increased.

In the lumber industry of Washington, as in that of Oregon, strikers halted or delayed operations in the late spring and early summer. At Tacoma there occurred repeated and serious disorder; mobs on the strikers' side attacked persons attempting to go to work at lumber yards and saw mills, and a force of National Guards and of police was used to break up the mobs. See **STRIKES AND LOCKOUTS**.

Under the Federal laws against abduction over State borders, Harmon M. Waley and his wife were convicted of having kidnaped George Weyerhaeuser, the young son of a wealthy family of timber-owners. The boy had been seized on May 24, taken to Idaho, and released on June 1, reportedly on the payment of a ransom of \$200,000.

Through initiative and referendum there was put in effect a restriction on the power of taxing

bodies to levy *ad-valorem* for the purpose of meeting any new bond obligations that they should contract; the limit was set at 40 mills on the dollar of valuation, but did not apply to service of bonds already outstanding. The effect was adverse to the possibility of cities' refunding their maturing or callable bonds with new issues.

Officers. The chief officers of the State, serving in 1935, were: Governor, Clarence D. Martin; Lieutenant-Governor, Victor A. Meyers; Secretary of State, Ernest N. Hutchinson; Treasurer, Otto A. Case; Auditor, Cliff Yelle; Attorney-General, G. W. Hamilton; Superintendent of Public Instruction, N. D. Showalter.

Judiciary. Supreme Court: Chief Justice, W. J. Millard; Associate Justices, Walter B. Beals, Warren W. Tolman, John R. Mitchell, John F. Main, O. R. Holcomb, W. J. Steinert, Bruce Blake, J. M. Geraghty.

WASHINGTON, THE STATE COLLEGE OF. A coeducational institution for higher learning at Pullman, Wash., founded in 1890. The enrollment for the autumn of 1935 was 3525. The 1935 summer session had an attendance of 715. There were 361 faculty members. The land-grant endowment amounted to \$3,395,636, while the income for the year was \$1,822,173. The library contained approximately 295,000 volumes. In cooperation with the Public Works Administration, the State of Washington, and the State College, a new chemistry building, a science building, and a modern power plant were completed and opened. A new men's dormitory housing 160 students was erected. President, Ernest O. Holland, Ph.D.

WASHINGTON, UNIVERSITY OF. A State institution of higher education in Seattle, Wash., founded in 1861. The enrollment for the autumn of 1935 was 9217. The 1935 summer session had an attendance of 3130. There were 556 members in the faculty (not including 98 laboratory or student assistants, or readers) during the autumn of 1935. For the biennium 1935-37 the estimated amount of endowment and income combined was \$6,154,103 (comprising all estimated receipts including Building funds). The university library contained 297,246 volumes and the law library 77,789 volumes. A new infirmary, dormitory, and addition to the power plant were under construction at an estimated total cost of \$950,000. President, Lee Paul Sieg, Ph.D.

WASHINGTON AND JEFFERSON COLLEGE. An institution for the higher education of men in Washington, Pa., which had its origin in the Washington Academy, founded in 1787. The enrollment for the fall semester of 1935-36 totaled 452 undergraduates and 38 graduate students. The 1935 summer session enrollment was 100. The faculty numbered 35. The productive funds of the college amounted to \$1,507,957.66, and the income from all sources was approximately \$238,554.08. The library contained 52,960 volumes. President, Ralph Cooper Hutchison, Ph.D., D.D.

WASHINGTON AND LEE UNIVERSITY. A nonsectarian institution for the higher education of men, in Lexington, Va., founded in 1749. The enrollment for the autumn of 1935 was 943. There were 57 members on the faculty. The productive funds of the university amounted to \$1,536,138, and the income for the year was \$282,859. The number of volumes in the library was approximately 70,000. President, Francis Pendleton Gaines, Ph.D.

WASHINGTON UNIVERSITY. A nonsectarian institution of higher learning for men and women in St. Louis, Mo., founded in 1853. The en-

rollment on Nov. 1, 1935, was 7236. The faculty numbered 593. The income for the year 1934-35 was \$2,368,503. Chancellor, George R. Throop, Ph.D., LL.D.

WATER-POWER. Most of the new hydro-electric construction during 1935 was in Government projects. None of these, however, had progressed to the stage of completion although some units are scheduled to go into operation in 1936. Despite this, the output of existing privately owned hydro-electric plants attained a new record of approximately 39 billion kilowatt-hours, or about 40 per cent of the total central station output which reached an all-time record.

Construction on Boulder Dam, the most outstanding of the hydro developments, was pushed forward during the year and was well ahead of schedule. The dam, itself, was completed and in 1936 there was to be impounded 4,500,000 acre-feet of water to regulate the flow of the Colorado River and prevent the usual serious spring flood conditions. The power house will start initial operation in 1936 with four 115,000-h.p. and one 55,000-h.p. units. Two additional 115,000-h.p. units have been ordered, which will make a total of 752,000 h.p., including the two 3500-h.p. auxiliary units.

The Norris and the Wheeler Dams of the Tennessee Valley Development are nearing completion. The former will add 132,000 h.p. and the latter 45,000 h.p. during the year to the 260,000 h.p. capacity already installed at Wilson Dam, making a total of 437,000 h.p. for the development. It is planned to increase this from time to time. The power house at Wheeler Dam has been laid out for eight units, the second 45,000-h.p. machine having already been ordered. These water wheels are of the fixed-blade propeller type and have the largest capacity of any machines of their kind in the world.

Another much-talked-of Federal project, the Grand Coulee Development in the State of Washington, was changed from a low-dam power development to an irrigation project although foundations are being put in to permit changing to a high dam at some future time, which will make possible the installation of 2,700,000 h.p. if the power demands in that section warrant.

Similarly the Parker Dam, 150 miles below Boulder Dam, will not have any power-generating equipment installed for the present but will be utilized for flood control and irrigation. It will make possible the development of 110,000 h.p. if requirements of the future warrant.

At the Bonneville Development, another Federal project near Portland, two 60,000-h.p. turbines of the Kaplan type, the largest of their kind, are being installed. This project is planned for an ultimate capacity of 600,000 h.p.

The Diabola Development for the city of Seattle, upon which work had been suspended, was completing the installation of two 83,000-h.p. units. The ultimate capacity of this plant will be 332,000 h.p.

Among some of the smaller and medium size hydro-electric plants automatic operation is again receiving attention.

In Canada an important addition to hydro-electric capacity during the year was three 53,000-h.p. units at the Beauharnois Development on the St. Lawrence River. The addition of these three units makes a total of eight in this plant. Two more similar units are on order. Another Canadian development, the Abitibi Canyon plant of the Hydro-Electric Commission of Ontario, installed three 66,000-h.p. units.

The proposed St. Lawrence Development on the International Section of the river which has been pending for several years received a setback in 1934 through failure of the United States Senate to ratify the treaty with Canada. Despite expectations, nothing further was done during 1935 to press ratification of the treaty.

Research in the water power field has centred principally on cavitation studies.

The total installed water wheel capacity in the United States Dec. 31, 1935, was approximately 16 million horsepower and about 1½ million horsepower was being installed, about half of which will go into service in 1936. In Canada the installed capacity is about 7½ million horsepower. See DAMS.

WATERWORKS AND WATER TREATMENT. About 11,000 waterworks systems now supply some 12,000 American cities and towns with water. About 63 per cent of the 1930 population of the United States lives in communities having public water service. (See figures by states, *Journal American Water Works Association*, January, 1935, pp. 91-93.) Considerably more than half of these waterworks deliver water from underground sources, according to data compiled by the U.S. Geological Survey. (*Public Works*, March, 1935, pp. 12-13.) The largest city supplied entirely by wells is Houston, Texas (pop., 292,352 in 1930).

Boston, Denver, San Francisco, and Southern California Projects. Progress on the Boston metropolitan and other large additional water supply projects noted in earlier YEAR BOOKS continued in 1935. At Denver modifications were made in the plan for bringing water eastward from the western slope of the Front Range of the Rocky Mountains through an enlargement of the pilot tunnel used to drive the Moffat railway tunnel. (*Engineering News-Record*, September 12, pp. 357-58.) Supplementary work on the new Hetch Hetchy supply for San Francisco includes an 85-ft. addition to the Hetch Hetchy or O'Shaughnessy Dam, bringing the overall height from crest to the lowest point in the foundation to 429 ft. and adding 70 per cent to the capacity of the reservoir. Late in the year the Metropolitan Water District of Southern California invited bids for the five pumping stations that will lift water from the Colorado River through the large and long aqueduct that will supply water to Los Angeles and adjacent communities. One of these stations will take water from the intake reservoir formed by the Parker Dam. The other four plants will serve as relay stations. Ultimately each station will contain nine electric-driven pumps, each with a capacity of about 200 cubic feet per second. Electric current will be supplied from the power plant at the Boulder Dam, 150 miles upstream. Construction of the Parker Dam was halted for a time by a U.S. Supreme Court injunction obtained by the State of Arizona. Work was resumed on specific authorization of Congress as an amendment to the Rivers and Harbor Bill. Studies for softening the Colorado River water are being made for the Southern California Water Supply District. To tide over the water supply of Los Angeles pending the completion of the Colorado River Aqueduct the city is extending the Los Angeles Aqueduct by an 11.3-mile tunnel to the Mono Basin, which lies in a latitude farther north than San Francisco. Additional electric power as well as more water will be obtained.

Chicago, FILTERS AND METERS FOR In July the legislature authorized the city to sell \$63,000,000 of bonds during 1936-41 to provide water treatment. The first part of the programme is the construction

of a 385- to 500-million gallon plant to serve the southern part of the city. This plant, together with universal metering in the area it will serve, will cost some \$20,000,000. Although not filtered, the water supply of Chicago is chlorinated. During the past year a plant for applying chlorine to kill bacteria and ammonia to control odor- and taste-producing micro-organisms was installed at the 68th St. and Dunne intake cribs located side by side in Lake Michigan. The daily supply drawn through these cribs and the tunnels leading from them to the pumping stations, where chlorine has been added heretofore, averages 360 million gallons and sometimes is 500 million. A scow will transport ammonia sulphate in 100-lb. bags and liquid chlorine in ton containers to one of the cribs. (For illustrated descriptions of the ammonia-chlorine equipment and the filter-and-meter project see *Engineering News-Record*, May 2, pp. 638-40, and Sept. 12, 1935, pp. 371-74.)

Colorado River Water for Irrigation. DESILTING THE. A method successfully employed to clarify muddy water for city supplies is to be utilized on an unprecedented scale to lessen the silt that otherwise would be carried into the All-American Canal and either clog it or require heavy annual dredging expenditures. This canal is to carry 15,000 cu. ft. per second eastward from the Imperial Dam, located on the Colorado River 250 miles below the Boulder Dam, to the Imperial Irrigation District south of the Salton Sea. Large settling basins at the head of the canal will be equipped with scrapers suspended from motor-driven revolving cantilever arms. The scrapers will sweep the deposited solids to a central point in each settling basin from which the silt will be discharged through conduits. By this means a large part of the 60,000 tons of silt carried daily by the diverted water will be kept out of the All-American Canal. (*Engineering News-Record*, Oct. 17, 1935, pp. 538-41.)

Detroit Adds Filters. The Spring wells filtration plant for Detroit, with a daily capacity of 272 million gallons, was completed in March, giving the city a filter capacity of 592 million gallons a day.

See **AQUEDUCTS AND DAMS.** An important new monograph is Baylis, *Elimination of Tastes and Odors in Water* (New York and London).

WATSON, SIR WILLIAM. An English poet, died at Ditchling Common, Sussex, Aug. 11, 1935. Born in Burley-in-Wharfedale, Yorks., Aug. 2, 1858, his early life was spent in Liverpool, whither his father had moved. His first volume of poetry, privately financed by his father, was *The Prince's Quest*, issued in 1880. Next he published *Epigrams of Art, Life, and Nature* (1884), quatrains, a form which proved a congenial medium. Recognition first came in 1890, when *Wordsworth's Grave* was issued, and it was believed that he would fall heir to the mantle of Browning, Arnold, and Tennyson. He again won acclaim for *Lachrimae Musarum* (1892), written on the death of Tennyson, and he was suggested for Poet Laureate.

With the publication of *The Purple East* (1896), in which he assailed England's treatment of Armenia, his popularity waned, and his sympathetic attitude toward the Boers, as well as his advocacy of the cause of Irish independence, detracted from, rather than added to, the position in which he was held. Again, his metrical attack on Mrs. Margot Asquith in *The Woman with the Serpent's Tongue* (1909) was not conducive to popularity.

Sir William's poetry was contemplative rather

than lyric, and except for his political sonnets, particularly free of passion. From the first, his work showed unmistakable signs of the influence of Keats, Tennyson, and Wordsworth, and the lucidity of his style, as well as the noble sentiments expressed, placed him in the classical tradition. With his death, an epoch of English poetry ended.

Twice the poet visited America, first in 1909 and again in 1912, the latter time to attend the Dickens Centenary in New York. To commemorate his visits he wrote "Hymn for America." In 1917 he was knighted, and on Nov. 13, 1930, was elected a corresponding member of the American Academy of Arts and Letters.

His works, other than those already mentioned, included: *Lyric Love* (1892); *The Eloping Angels* (1893); *Excursions in Criticism* (1893); *Odes, and Other Poems* (1894); *The Father of the Forest* (1895); *The Year of Shame* (1896); *The Hope of the World* (1897); *Collected Poems* (1898); *Ode on the Coronation of King Edward VII* (1902); *For England* (1903); *Collected Poems* (2 vols., 1906); *New Poems* (1909); *Sable and Purple* (1910); *The Heralds of the Dawn* (1912); *The Muse in Exile* (1913); *Pencraft: A Plea for the Older Ways* (1916); *Retrospection* (1916); *The Man Who Saw* (1917); *The Superhuman Antagonists* (1919); *Ireland Unfreed* (1920); *A Hundred Poems*, a selection from his various volumes (1922); *Poems Brief and New* (1925); *Selected Poems, with Notes by the Author* (1928).

WELFARE WORK. United States. The expenditure of funds for welfare work in the United States continued, during 1935, to be a major function of the Federal Government. According to a report on the source of relief funds, April, 1935-June, 1935, 98.8 per cent of the money distributed during those months came from public sources, but 1.2 per cent coming from private sources. The year opened with 20,654,085 persons on the rolls of the Federal Emergency Relief Administration. In that month Federal funds to a total of \$151,821,583 were made available for their maintenance, which sum was 77.3 per cent of the total cost. In the same month State funds accounted for 9.7 per cent and local funds for 13 per cent of the money expended. The tables printed below indicate the size of the relief load from January through September and the cost of maintaining it. It will be noted that there was a slow decline in numbers receiving aid from January—from 17 per cent of the population as estimated by the 1930 census to 12 per cent. Under the FERA most of the relief granted was in the form of direct relief, though there was a slow and constant increase in the number of persons employed on work projects, until a total of in excess of 1,250,000 individuals per month were earning their relief allowances. This development was in harmony with the President's aspiration to make it possible for relief recipients to earn their allowances rather than to obtain them as free gifts. However, he and his advisers became convinced that a shift of emphasis would have to be made. They therefore evolved the so-called Works Program "to provide relief, work relief, and to increase employment by providing for useful projects," known legislatively as the Federal Emergency Relief Act, approved Apr. 8, 1935. The Act appropriated \$4,000,000,000 together with \$880,000,000 from unexpended balances of the Reconstruction Finance Corporation and the Public Works Administration.

The expenditure of the money was to be under

the control of the President and was to be available until June 30, 1937, for the following general classes of projects: Highways including grade crossings, rural rehabilitation and relief, including water conservation and regulation, rural electrification, housing, assistance for educational, professional, and clerical persons, Civilian Conservation Corps, loans or grants or both for projects of states and other political subdivisions, and for self-liquidating projects of a public character, land and flood control, reforestation, etc. The object of this Act was, as stated above, to change the emphasis of the Federal Relief Program from direct relief to work relief, the theory behind the change being of a two-fold character. In the first place, it was desired to expend relief money in such a fashion that permanent improvements in the national physical plant could be made, and in the second place, it was believed that work of a useful kind would improve the morale of the relief recipients and act as a method of retraining them for private employment if and when available.

The programme early met profound opposition from two sources. During the months when the FERA had been chiefly a direct relief organization, the business interests organized in such groups as the Chamber of Commerce, had shifted from an opposition to the so-called dole to approval of it. They therefore opposed the Works Program on the ground of excessive expense as ardently as they had once denounced the dole as demoralizing. Opposition was also immediately aroused when the wage scales for the Works Relief Program were announced. It was freely alleged that the scales were not only unworkable but were a menace to the continuance of reasonable and decent scales in private industry, and they were therefore opposed by organized labor throughout the nation, even to the extent of strikes on works undertaken. The task of carrying out the major part of the undertakings under this relief programme was given to an organization called the Works Progress Administration, directed by Harry L. Hopkins, who held the similar position under FERA. Because of the opposition the programme aroused, and because of the inherent difficulties of finding suitable works projects for the relief recipients, most of whom were casualties of private industry and therefore not naturally fitted for public works activities, the programme was slow in getting under way and eventually was forced to compromise some of its fundamental tenets. After an initial effort to employ men at the trades they reported themselves as ordinarily following, resort was finally had to the so-called CWA method of giving a man a job regardless of his previous training. Moreover, the protests of the workers forced the revision upwards of the wage scales in some localities. Many local communities found it impossible to coöperate with the WPA and therefore left the workers on direct relief.

Moreover, it was the original theory of the undertaking that as the workers were transferred from direct relief to work relief, the old direct relief organization would be liquidated as far as the Federal Government was concerned, and the persons on the rolls in the local communities still requiring direct aid would be taken over as charges of the local community. These people, it was expected, would chiefly be "unemployables," and as such permanent relief cases. In practice it was discovered that not all employable persons in every community could be absorbed on WPA projects, and, also, it was discovered that many communities

were financially unable to assume the responsibility for the unemployables on their relief rolls. While the Federal Government persisted in its programme of discontinuing grants to cities in so far as possible, and while it announced the total liquidation of FERA in late November of 1935, there still remained large numbers of individuals on the relief rolls of the nation who, while employable, were not working on WPA projects, and others who by definition were unemployables, and could not count on aid from the local authorities. As the year closed, it was apparent that the Federal Government would have to remain in what the President had called the "relief business." That it will do so is indicated by the statement made by President Roosevelt during the week ending Nov. 23, 1935: "The Federal Government . . . does not propose to let people starve after the 1st of July any more than during the past few years." This position was also taken by Harry L. Hopkins, Works Progress Administrator: "The Government of the United States and its states and cities have put their hands to this plow, and it will never be taken away. We may change our methods and our expenditures but in one form or another these people at the bottom of the heap are going to get care."

Foreign. The relief programme continued to be to the fore in most of the nations of the world during the year 1935. In a learned study entitled "Aiding the Unemployed, a Survey of Methods and Trends in 24 Foreign Countries" Dr. Hertha Kraus outlined the various methods of meeting the problem. From this study it is apparent that

- (1) No one method of meeting the situation has proved to be uncontestedly superior to any other method;
- (2) That the state of social legislation in a nation has direct relation to the size of the population requiring direct relief—which is to say, that elaborate and efficient social legislation tends to reduce the numbers requiring general relief assistance; and
- (3) That no nation has yet shaken its methods of public assistance down into a consistent pattern, but that experimentation in this field is going on the world over.

While all countries aspire to care for unemployed persons through the utilization of funds previously accumulated by them in the form of insurance, no country has escaped the necessity of providing general relief funds. During the year 1935, no spectacular departures from previous patterns of assistance were made, unless it be that there was an increasing emphasis upon the problem of the unemployed young. This problem has been met in various countries by such dissimilar devices as raising the school age (Belgium), enforced service in labor battalions (Germany), and money assistance to students for their continuation in school (U.S.A.).

Studies of the Relief Population. While the United States remains without valid, comprehensive statistics on the unemployed and relief populations, the volume of material based upon exact research is constantly growing. From this material it is clearly apparent that the involuntarily unemployed who fall on relief are distinguishable from the unemployed who do not, chiefly by three characteristics.

1. Their position low on the labor scale—unskilled and semi-skilled workmen;
2. The fact that they receive low wages when employed; and
3. The fact that their family responsibilities—number of children—tend to be too heavy a burden for the income received.

It has also been established that in the United States potent sources of relief recipients are declining industries like cotton textiles and bituminous coal. Other major centres of relief populations are

deteriorating agricultural areas like the Lake States Cut-Over region, the Appalachian-Ozark Region, and the cotton South, where the collapse of the share-cropper system has produced a particularly exasperating relief problem. It is becoming clearer to students of the subject, that while increased production and employment will reduce the relief load in the United States below the 15,000,000 level of September, 1935, there will always be a sizable relief population. It is to this population that Messrs. Roosevelt and Hopkins had reference in their statements quoted above. See UNITED STATES.

1935), 444,072 exclusive of 29,298 (1933 census) aborigines (25,623 full-blood and 3675 half-caste). Perth (capital) with suburbs including Fremantle (25,233 inhabitants) had 213,828 inhabitants (Jan. 1, 1935). During 1934, there were 7801 births, 4076 deaths, and 3682 marriages.

Production. The 1935 agricultural yield was wheat, 26,961,090 bu.; oats, 5,665,000 bu.; barley, 394,000 bu.; hay of all kinds, 420,000 tons; wine (1934), 427,458 gallons; wool (1933), 85,118,808 lb. Livestock in the State (Jan. 1, 1935): 11,191,808 sheep, 912,016 cattle, 161,660 horses, and 98,093

WELLESLEY COLLEGE. A nonsectarian institution for the higher education of women in Wellesley, Mass., chartered in 1870. The enrollment for the academic year 1935-36 was 1494. The teaching staff numbered 177. The current income for the year 1934-35 was \$1,174,793. The library contained approximately 154,000 volumes. In September, 1935, Pendleton Hall was opened; President, Ellen F. Pendleton, Litt.D.

WELLS COLLEGE. An institution of higher learning for women in Aurora, N. Y., founded in 1868. The enrollment for the autumn of 1935 was 267. The faculty numbered 41 members. The endowment amounted to \$1,515,580, and the income for the year from invested funds, tuition, etc., was \$347,029. There were approximately 78,000 volumes in the library. President, Kerr Duncan Macmillan, S.T.D.

WESLEYAN UNIVERSITY. An institution for the higher education of men in Middletown, Conn., founded in 1831. The 1935 autumn enrollment was 677. The faculty numbered 73. The productive funds of the university for 1935 amounted \$7,100,071, and the income for the year was \$631,867. Gifts amounting to \$2,562,454, mainly from the estate of Charles H. Morse and the Surdan Foundation, were received. The library contained about 196,000 volumes. President, James L. McCaughy, Ph.D.

WESTERN AUSTRALIA. A State of Australia. Area, 975,920 sq. miles; population (Mar. 1,

swine. Dairy production (1933-34): 11,911,912 lb. butter, 285,461 lb. cheese, 4,586,343 lb. bacon and ham. Mineral production (1934) was valued at £5,897,878 including gold £5,534,491; silver and lead, £7199; tin, £6765; coal, £300,000. During 1933-34, from the 1606 factories with 16,163 workers, the value of production was £5,444,280.

Government. For the year ended June 30, 1935, revenue amounted to £9,331,430; expenditure, £9,498,525; public debt, £88,590,176. Executive power was vested in a governor, and legislative power in a legislative council of 30 members and a legislative assembly of 50 members. Governor in 1935 (vacant); Lieutenant-Governor, Sir James Mitchell; Premier, Phillip Collier. See the article on AUSTRALIA.

WESTERN RESERVE UNIVERSITY. A nonsectarian institution for the higher education of men and women in Cleveland, O., chartered in 1826. There were enrolled in the 13 colleges and schools, in the autumn of 1935, 3050 full-time students and 3718 part-time students. The 1935 summer session had an attendance of 1270. The faculty numbered 640, not including 154 scholars, assistants, and fellows. The endowment amounted to \$12,303,108; the income for the year 1934-35 was \$2,022,163. President, Winifred G. Leutner, Ph.D.

WEST VIRGINIA. Population. On Apr. 1, 1930 (Fifteenth Census), 1,729,205; July 1, 1934 (latest Federal estimate), 1,786,000; 1920 (Census), 1,463,701. Charleston, the capital, had (1920),

60,408 inhabitants; Huntington, 75,572; Wheeling, 61,659.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame)	1935	632,000	724,000*	\$ 7,457,000
	1934	635,000	502,000*	8,785,000
Corn	1935	472,000	13,216,000	10,573,000
	1934	441,000	12,128,000	10,673,000
Apples	1935	5,610,000	4,095,000
	1934	3,630,000	3,412,000
Potatoes	1935	34,000	2,924,000	1,901,000
	1934	40,000	3,120,000	2,527,000
Wheat	1935	145,000	2,538,000	2,259,000
	1934	141,000	1,974,000	1,895,000
Oats	1935	87,000	2,044,000	1,083,000
	1934	108,000	2,052,000	1,149,000

* Tons.

Mineral Production. West Virginia retained in 1935 its lead among the States of the Union in the mining of bituminous coal. Its production rose to 98,589,000 net tons, approximately, for 1934, from 98,134,393 tons for 1934. In 1934, 19,231,384 tons of coal from the State were consumed in by-product coke ovens; over 18,600,000 tons thereof, in other States, to which the coal had been shipped. There were used in the State's own byproduct ovens 1,985,711 tons of coal, partly from outside the State; these yielded 1,343,914 net tons of coke; for 1933 the corresponding total was 1,074,002 tons. Beehive coke ovens, of which a considerable number still operated, yielded another 171,518 tons of coke in 1934. Much of the coke made in the State went into the production of pig iron, of which the total quantity shipped by the blast furnaces in 1934 was 445,688 gross tons.

The production of natural gas was held down to 95,000,000 M cu. ft. for 1934, some 2500 of the approximate total of 12,700 wells being shut down for most of the time. Over 63 per cent of the produced gas moved out of the State through pipe lines to supply demand elsewhere. The production of petroleum increased to 4,096,000 barrels (1934) from 3,815,000 (1933).

Education. The number of inhabitants of school age was reckoned, for the academic year 1934-35, as 553,685. The year's enrollments of pupils in the public schools numbered 447,756. Of these, 342,633 were in common schools or elementary grades, and 105,123 were in high schools. The year's expenditures for public-school education throughout the State totaled \$23,392,179. The yearly salaries of teachers averaged \$1073.

Charities and Corrections. The West Virginia Board of Control exercised full, centralized control over the State institutions for the care and custody of persons, under the administrative system in force in 1935. The Board was composed of three appointed members. It held title to the State's institutional properties and supervised a State agency that made purchases for the institutions and for the State's departments and agencies as well. It authorized and paid the State institutions' expenditures.

The State institutions and their respective populations of Nov. 1, 1935, were: for the insane, Weston State Hospital (1585), Spencer State Hospital (829), Huntington State Hospital (854), Lakin State Hospital (colored: 328); for the feeble-minded, West Virginia Training School (81), at St. Mary's; for cases of tuberculosis, Pinecrest Sanatorium (140), and Denmar Sanatorium (colored: 69); for certain other diseases, Berkeley Springs Sanitarium; for general hospital

service, Welch Emergency Hospital (42), and Fairmount Emergency Hospital (51); for penal and correctional custody, West Virginia Penitentiary (2514), Industrial School for Boys (354) at Grafton, Industrial Home for Girls (201) at Salem, Industrial School for Colored Boys (98) at Lakin, and Industrial Home for Colored Girls (30) at Huntington; for dependent children, Children's Home (93) at Elkins and Colored Children's Home (61) at Huntington; West Virginia Home for Aged and Infirm Colored Men and Women (47), at Huntington.

Legislation. The regular session of the Legislature created a tax on personal net incomes, excepting those under \$600 a year as to single persons and \$1300 as to married pairs, excepting also \$200 for each dependent. The imposition of the sales tax on automobiles was abolished; in its stead was created a privilege tax of 2 per cent of the price at which an automobile had been purchased, which tax the acquirer must pay in order to get a certificate of title.

To handle the traffic in alcoholic liquor the Legislature created a State Liquor Commission and gave it authority to conduct State-owned shops and there to sell at retail by the bottle. Beer of the alcoholic strength of not over 5 per cent was alone allowed to be sold prior to the opening of the State shops.

Political and Other Events. The coal industry of the State was variously affected by the Federal Bituminous Coal Act, according to the status of relations with labor unions in the divers fields and companies. Though quite largely dependent on industrial wages for their normal livelihood, the inhabitants of the State fared somewhat better, as to avoiding destitution, than the inhabitants of the country as a whole. For 1934, as was to be noted from the figures reported by the FERA, the cost of public support for the State's destitute unemployed came to \$11 per capita of all the State's inhabitants, whereas the corresponding cost for the whole nation was about \$12; conditions remained much the same until spring, when they began a gradual improvement. The total cost of the public support for the State's unemployed in 1934 was \$19,216,022, of which the FERA furnished 87 per cent and the State almost all the rest.

Officers. The chief officers of the State, serving in 1935, were: Governor, H. G. Kump; Secretary of State, William S. O'Brien; Treasurer, R. E. Talbott; Auditor, Edgar B. Sims; Attorney-General, Homer A. Holt; Commissioner of Agriculture, J. B. McLaughlin; Superintendent of Schools, W. W. Trent.

Judiciary. Supreme Court of Appeals: President, M. O. Litz; Associate Judges, J. H. Hatcher, Jo N. Kenna, Haymond Maxwell, Homer B. Woods.

WEST VIRGINIA UNIVERSITY. An institution for the higher education of men and women maintained by the State of West Virginia at Morgantown, founded in 1867. In the autumn of 1935 the enrollment was 2564. The 1935 summer session had an attendance of 1223. The faculty numbered 212. The library contained more than 150,000 volumes. The total income for 1934-35 from State appropriations and Federal grants was \$2,091,663. New dormitories for men and for women were completed. President, Chauncey Samuel Boucher, Ph.D.

WHEAT. In reviewing the world's wheat situation the U.S. Department of Agriculture reported that towards the close of 1935 the world's sup-

plies for 1935-36, exclusive of China and the Soviet Republics, were estimated at about 4,339,000,000 bu., less by 367,000,000 bu. than the supplies of the preceding commercial season and about 535,000,000 bu. below the average supplies available during the five years 1928-32. Similarly the world wheat stocks at the beginning of the 1935-36 season were about 870,000,000 bu. or approximately 260,000,000 bu. less than a year earlier.

The 1935 production of 42 countries reporting to the International Institute of Agriculture not including China, the Soviet Republics and countries of the southern hemisphere, excepting Australia, was estimated at 1,929,581,000 bu., 2.8 per cent more than in 1934 and 7.7 per cent below the average annual yield for the five years 1930-34. The production of the leading countries exclusive of the United States was reported as follows: India 217,818,000 bu., Italy 170,076,000 bu., France 167,261,000 bu., Germany 103,022,000 bu., Spain 92,367,000 bu., and Australia 81,000,000 bu. The Soviet Republics reported a yield of 690,000,000 bu. in 1934. The 1935-36 crop of Argentina was estimated at 144,035,000 bu., or 96,634,000 bu. below the preceding crop and the smallest since 1916. As the annual exports of Argentina to other South American countries average about 36,000,000 bu. it was thought that only about 26,000,000 bu. would remain for the European market in 1936.

Estimates by the Department of Agriculture placed the 1935 production of all wheat in the United States at 603,199,000 bu., 21 per cent above the very short crop of 426,929,000 bu. in 1934 but 30 per cent below the average of 860,570,000 bu. for the five years 1928-32. The total wheat acreage harvested in 1935 was reported as 49,826,000 acres, compared with 42,249,000 acres in 1934 and 59,885,000 acres, the average for the five-year period. The average yield per acre, 12.1 bu., was only .3 of a bu. above that of 1934 and 2.3 bu. under the average for the five years. The average farm price towards the close of 1935 was 81.6 cents per bu., or 2.7 cents below the average farm price in 1934 and on this basis the total values of the two crops were \$353,688,000 and \$341,916,000 respectively. The yields of the leading States were reported as follows: Kansas 59,951,000 bu., North Dakota 53,772,000 bu., Washington 45,577,000 bu., Ohio 42,406,000 bu., and Nebraska 39,472,000 bu.

The 1935 production of winter wheat was placed at 433,447,000 bu., compared with 405,552,000 bu. in 1934 and 618,186,000 bu., the average for the five-year period. The acreage was 31,000,000 acres and the average yield per acre 14 bu. The production of the leading States was estimated as follows: Kansas 59,887,000 bu., Ohio 42,343,000 bu., Nebraska 36,400,000 bu., Oklahoma 33,080,000 bu., and Washington 30,425,000 bu. The production of all spring wheat including hard red spring, durum and white spring wheats was placed at 169,752,000 bu. produced on 18,826,000 acres at an average yield of 9 bu. per acre. The yields of the leading spring wheat States were recorded as follows: North Dakota 53,772,000 bu., South Dakota 29,242,000 bu., Montana 24,548,000 bu., and Minnesota 17,021,000 bu. The total durum wheat production of 26,777,000 bu., compared with 7,086,000 bu. in 1934, was distributed as follows: North Dakota 17,000,000 bu., South Dakota 8,160,000 bu., Minnesota 1,261,000 bu., and Montana 356,000 bu.

During the fiscal year ended June 30, 1935, the United States exported 3,019,000 bu. of wheat, 2,260,000 bbl. of wheat flour, and 1,738,000 lb. of

wheat products and imported 16,907,000 bu. of wheat including flour.

WHEELER-RAYBURN BILL. See **ELECTRIC LIGHT AND POWER INDUSTRY.**

WHITLEY, THE RT. HON. JOHN HENRY. An English radio executive and former Speaker of the House of Commons, died in London, Feb. 3, 1935. Born in Halifax, Yorks., Feb. 8, 1866, he was educated at Clifton College (1878-84), and at London University. Upon the completion of his education, he entered the business of S. Whitley and Co., cotton spinners of Halifax. Interested in civic improvement, he served on many local committees, and from 1893 to 1900 was a member of the Halifax Town Council. During this period he visited the United States to study surface transportation methods, a subject of great interest to him.

Elected to Parliament as a Liberal from Halifax in 1900, he served in many posts during his 28-year tenure of office. He was Junior Lord of the Treasury (1907-10); deputy chairman of Ways and Means (1910), chairman of Ways and Means and Deputy Speaker (1911-21); and chairman of the Committee on the Relations of Employers and Unemployed, known as the Whitley Commission (1917-18). In 1921 he was elected Speaker of the House, and although at first opposed by the Conservatives, was unanimously elected. His knowledge of the rules and usages of the House stood him in good stead during many turbulent years, and he was known for his tact in handling many trying situations. He was the first Speaker to be engaged in trade, and the first Speaker in many years who, for personal reasons, refused the peerage upon his retirement.

From 1929 to 1931, Mr. Whitley was Chairman of the Royal Commission on Labor in India, and for his work was awarded the Kaisar-i-Hind Medal, 1st class. In 1930 he received the appointment of Chairman of the Board of Governors of the British Broadcasting Company for a five-year term of office. Reluctant at first to accept such a position, he afterward acknowledged his enjoyment and interest in the work. Since May, 1928, he had been president of Clifton College.

WILLIAM AND MARY, COLLEGE OF. An institution for the higher education of men and women at Williamsburg, Va., founded in 1693. The enrollment for the autumn of 1935 was 1156. The 1935 summer session had an attendance of 803 students. The faculty numbered 89 at the college, 13 in the Richmond division, and 14 in the Norfolk division. The gross income for the year 1934-35 was approximately \$950,000. The college recently received a bequest from the estate of the late John Barton Payne which will approximate \$350,000. A new men's dormitory, a new administration building, and a new stadium were completed during the year. President, John Stewart Bryan, A.M., Litt.D., etc.

WILLIAMS, WALTER. An American journalist and college president, died in Columbia, Mo., July 29, 1935. Born in Boonville, Mo., July 2, 1864, he received a common school education, and early learned the printer's trade. By 1884 he was editor and part owner of the Boonville *Advertiser*, which he disposed of in 1889 to become editor of the Columbia (Mo.) *Herald*, a weekly. He remained as editor of this paper until 1908, and during this period he found the time to edit the *St. Louis Presbyterian* (1897-99) and the *Daily State Tribune* of Jefferson City (1894-1902). Also, he established *The Country Editor* (1895), a monthly

for the service of country editors, and maintained it for five years. He was the author of the widely circulated "The Journalist's Creed."

It had long been Mr. Williams' belief that journalists should be given a special training as were doctors and lawyers, and while serving as chairman of the Board of Curators of the University of Missouri (1898-1908), he had frequently voiced this opinion. Finally in 1908, through his efforts, as well as those of the Missouri Press Association, of which he was a founder, the University opened the first School of Journalism in the world. Mr. Williams resigned his outside interests to become professor of the history and principles of journalism, and dean of the School of Journalism. Under his capable administration, the School became one of the foremost in the world. A complete training in all phases of newspaper work is given, and a daily paper published. In the 20 years of the School's existence, more than 1000 have been graduated. From June to December, 1930, Dr. Williams served as acting president of the University, and in 1931 was appointed president, a position he was forced to resign because of failing health on Sept. 10, 1934.

During the course of his career, he received honorary degrees from various colleges, and from 1902 to 1904 he toured the world to interest the foreign press in the Louisiana Purchase Exposition. He served as president for North America of the International Press Congress, Berne (1902); as organizer and secretary of World's Press Parliament, St. Louis (1902); first president, Press Congress of World (1915-25), and subsequently honorary president; president, First Pan-American Congress of Journalists (1926); exchange professor, National University of Mexico (1925); exchange lecturer in Buenos Aires (1930). Also, he was a Fellow of the Kahn Foundation for Foreign Travel of American Teachers (1913-14); a Fellow of the British Institute of Journalists, and in 1932 and 1933 held the Oberlaender Award of study in German speaking countries.

His publications include: *The State of Missouri* (1904); *History of Missouri* (1908); *Missouri Since the Civil War* (1909); *Eloquent Sons of the South* (1909); *From Missouri to the Isle of Mull* (1909); *The Practice of Journalism* (1911); *History of Northeast Missouri* (1914); *History of Northwest Missouri* (1915); *The World's Journalism* (1915); *Journalism—the Newest Weapon for Democracy* (1919); *The Press Congress of the World in Hawaii* (1922); *History of Missouri Since the Civil War* (1927); *The Press Congress of the World in Switzerland* (1927); also, pamphlets on *Some Observations on the German Press* and *The Struggle in Europe for the Freedom of the Press*.

WILLIAMS COLLEGE. A nonsectarian college for men in Williamstown, Mass., founded in 1793. The enrollment for the autumn of 1935 totaled 827. There were 76 members on the faculty. The income for the year ending June 30, 1935, was \$735,173. The number of volumes in the library was about 161,900. President, Tyler Dennett, Ph.D., whose induction occurred on Oct. 5, 1934.

WILLYS, JOHN NORTH. An American manufacturer and ambassador, died at Riverdale-on-Hudson, N. Y., Aug. 26, 1935. Born at Canandaigua, N. Y., Oct. 25, 1873, he was educated in the public schools, and in 1890 began in the bicycle business in Canandaigua. Later he removed to Elmira and organized the Elmira Arms Co., a

sporting goods concern, and subsequently engaged in selling automobiles. He organized the American Motor Sales Co. in 1906, and in the following year acquired the Indianapolis plant of the Overland Automobile Co., and began the manufacture of automobiles. In 1908 he acquired the Pope Toledo plant at Toledo, Ohio, and from that time forward, his business increased. In 1912 he purchased the Gramm Motor Truck Co. of Lima, Ohio, and during the World War, this phase of his business greatly improved through the Government's need for trucks. He was president of the Curtiss Airplane and Motor Co. of Buffalo in 1917, and in the following year purchased the Moline Plow Co., with plants in various Western cities. He established a profit sharing plan with his employees in 1919. During the World War he served as Chairman of the War Camp Community Recreation Fund.

After the War, the Willys Corporation, which was separate from the Willys-Overland Co., suffered reverses and went into receivership, which necessitated the selling of a plant at Trenton, N. J. In 1923, outside interests obtained control of the Willys-Overland Co. in equity receivership from the Willys Holding Co. of Toledo. Mr. Willys and the Company retrenched, and by the end of 1924 all creditors were paid. Two years later, the Whippet, a new type of light car, combining the best features of English and American construction, was put out by the Willys Company. In 1929 the Willys-Overland Co. went into receivership, and Mr. Willys was appointed chairman of the Board as well as co-receiver. He himself sustained no monetary loss at this time because he sold out his financial interest in the Company previous to its failure.

In 1930, he was appointed Ambassador to Poland by President Herbert Hoover, and though successful and well liked by the Polish people, he resigned on Apr. 26, 1932, to reenter the business world. He again assumed the chairmanship of the Willys-Overland Co., and on Jan. 18, 1935, was elected president of the Company by the preferred stock holders.

WILSON, FRANCIS. An American actor, died in New York City, Oct. 7, 1935. Born in Philadelphia, Feb. 7, 1854, he first appeared on the stage in a minstrel show, and his first appearance on the legitimate stage was made at the Chestnut St. Theatre, Philadelphia, in 1877. He played there until 1879 when he made his New York debut at Tony Pastor's. Later he appeared in comic opera, one of his rôles being that of Sir Joseph Porter in *Pinafore*. He joined the McCaull Opera Company as a comedian in 1885, and remained with them until 1889. It was during this period that he created his most famous rôle of Cadeaux in *Erminie*.

Organizing his own company, he opened in *The Oolah* on May 13, 1889, and for the next 15 years appeared in the leading comedy rôles in *The Merry Monarch*; *Erminie* (a revival); *The Chieftain*; *The Devil's Deputy*; *The Little Corporal* (1898-99); a musical version of *Cyrano de Bergerac* (1899-1900); *The Toreador* (1902-03; 04-05). He appeared as David in an all-star revival of *The Rivals* in 1896. His association with Charles Frohman began in 1905 and he appeared in *Cousin Billy* (1905); *The Little Father of the Wilderness* (1905); *When Knights Were Bold* (1907-08), in which he was very successful and toured through 1908-09; *The Bachelor's Baby* (1908-11), also taken on tour; *The Spiritualist* (1911, 1912).

For the next 10 years, Mr. Wilson lectured throughout the country on "The Eugene Field I Knew"; "Humorous Side of an Actor's Life," and "Joseph Jefferson." In 1920 he returned to the stage in *Erminie* with De Wolf Hopper (q.v.), and thereafter played Bob Acres in *The Rivals* (1922); *The School for Scandal* (1923); *She Stoops to Conquer* (1924); *The Rivals* and *Rip Van Winkle* (1925). His last appearance on the stage was in the Players' Club production of *The Little Father of the Wilderness* in 1930.

Actively interested in every phase of his profession, Mr. Wilson was one of the organizers of the Actors Equity Association in 1915, formed to obtain better treatment for the members of the profession, and in the actors' strike of 1918 was a leading spirit. The first president of the organization, he retired in 1921. The work done by him in connection with this Association may well be called his monument. In recent years he had organized a Little Theatre at Clearwater, Fla., where he wintered, and in 1934 it was endowed by Mrs. Edward Bok and called the Francis Wilson Little Theatre.

Besides writing many of the plays in which he appeared, including *The Bachelor's Baby* and *The Spiritualist*, he was the author of *The Eugene Field I Knew* (1898); *Recollections of a Player*; *Joseph Jefferson*; *Francis Wilson's Life of Himself* (1924); *John Wilkes Booth* (1929), and *Edwin Booth*.

WINDWARD ISLANDS. A group of islands in the British West Indies, comprising Grenada, St. Lucia, St. Vincent, and the Grenadines. The seat of the government was at St. George's in Grenada. There was one governor for the three islands but each had its own legislative council. Governor and Commander-in-Chief in 1935, Sir Selwyn Grier. See GRENADA, ST. LUCIA, and ST. VINCENT.

WISCONSIN. Population. On Apr. 1, 1930 (Fifteenth Census), 2,939,006; July 1, 1934 (latest Federal estimate), 3,005,000; 1920 (Census), 2,632,067. Milwaukee (1930) had 578,249 inhabitants; Madison, the capital, 57,899.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame) . .	1935	2,687,000	5,182,000*	\$34,719,000
	1934	2,450,000	2,422,000*	42,385,000
Corn	1935	2,312,000	78,608,000	51,095,000
	1934	2,384,000	73,904,000	57,645,000
Oats	1935	2,637,000	85,702,000	25,711,000
	1934	2,334,000	65,352,000	30,715,000
Barley	1935	941,000	25,878,000	14,233,000
	1934	741,000	19,266,000	18,110,000
Potatoes	1935	253,000	20,746,000	10,373,000
	1934	261,000	31,320,000	10,336,000
Wheat	1935	139,000	2,254,000	2,137,000
	1934	108,000	1,647,000	1,596,000
Rye	1935	314,000	4,082,000	1,755,000
	1934	221,000	1,768,000	1,255,000

* Tons.

Education. The number of inhabitants of school age, in the academic year 1934-35, approximated 872,000; it was placed as some 10,000 below the number for the year before. The year's enrollments in the public schools, for which the totals had yet to be exactly determined, were estimated, for the high schools, as some 10 per cent above the 132,463 of the year before; for the elementary grades, as somewhat lower than the previous 419,849. The year's expenditures for public-school education again approximated \$42,000,000. The minimum of \$75 a month, which had formerly

applied to teachers' salaries but had been reduced, was restored.

Charities and Corrections. The State's central administrative authority over institutional care and custody of persons, under the laws in force in 1935, was the State Board of Control. It was composed of three members. In its charge were 18 State institutions, containing on October 31 an aggregate of 8415 inmates. These institutions and their respective populations of that date were: Mendota State Hospital (870), at Mendota; Winnebago State Hospital (775), at Winnebago; Central State Hospital (278), Waupun; Memorial Hospital (84), at Mendota; Northern Colony and Training School (1535), Chippewa Falls; Southern Wisconsin Colony and Training School (759), Union Grove; State Sanatorium (206), at State-san; Lake Tomahawk State Camp (39), Lake Tomahawk; State Prison (1727), Waupun; State Reformatory (465), Green Bay; Industrial Home for Women (77), Taycheedah; a prison for women, included in the Industrial Home, but having a separate population of 53; Industrial School for Boys (382), Waukesha; Industrial School for Girls (192), Milwaukee; State Public School (508), Sparta; School for the Deaf (226), Delavan; School for the Blind (147), Janesville; Workshop for the Blind (92), Milwaukee. Persons at liberty under parole from State institutions numbered 3718.

Legislation. The duration of the regular legislative session was protracted to 262 days. Its length was in some degree attributable to the consideration of the question whether to adopt Governor La Follette's recommendation of a programme of \$209,000,000 of State expenditure of the "work-relief" type, to be financed mainly with Federal loans and gifts. La Follette's political organization stirred up much popular fervor for the plan, which many alarmed taxpayers none the less opposed. It encountered strong opposition in the upper house of the Legislature as well, and was defeated by combined Republicans and Democrats.

A budget bill carrying appropriations of \$50,197,074 for the ensuing two years was passed; it increased the appropriations for the State's system of pensions to the elderly, for aid to mothers, and toward the support of public schools. Legislation was passed to improve the condition of employees in penal and charitable institutions. A maximum working day of eight hours was prescribed for such institutions. The Governor withheld his signature from a measure which had been passed, imposing an "excess-profits" tax on incomes, relatively small ones included, with a view to producing \$1,000,000 a year for State aid to high schools. Among many minor laws, one required hotels and restaurants to serve cheese with every meal.

Political and Other Events. Governor La Follette's campaign for the Legislative adoption of his scheme for the expenditure of \$209,000,000 on public works in the State was one of the striking occurrences of the year. The plan involved the creation of a Wisconsin Finance Authority, authorized to engage in many forms of business and to use a fund of \$100,000,000 to be obtained from the Federal Government, as well as great sums to come through the application of new taxes. This body was also to have had the power to issue notes, in denominations as low as \$1, redeemable in State banks. While nominally an independent body, it would have been under the virtual domination of the Governor.

The State's act to provide conformity with the

NRA was invalidated on March 5 by the State Supreme Court as making an unconstitutional delegation of legislative authority in giving industries power to make compulsory codes for the government of their members. The State's law for the establishment of pensions to the elderly needy inhabitants, which had been enacted some 10 years before, became compulsory for all the counties on July 1. It had previously been optional with the several counties, any of which might adopt it by vote of the county board. In 1931 the law had been amended to render the plan compulsory for all counties after July 1, 1935.

The University of Wisconsin was attacked in a report rendered on September 21 by an investigating committee of the State Senate, which charged it with encouraging Communistic teachings and making avowed Communists welcome. Dr. Glenn Frank, president of the University, was specifically mentioned as understood by "a large group" to have encouraged communistic meetings and ideas.

After protracted litigation a court granted in October, 1934, permission sought at the instance of the Izaak Walton League, to flood the 40,000-acre area of the old Horicon Marsh on the Rock River. This marsh, once a great breeding ground for ducks, had been drained some 30 years before, by a land company which later failed. After the issue of the court order a dam was built to flood the area, and ducks were released there in May.

Officers. The chief officers of the State, serving in 1935, were: Governor, Philip F. La Follette; Lieutenant-Governor, Thomas J. O'Malley; Secretary of State, Theodore Dammann; Treasurer, Robert K. Henry; Attorney-General, James E. Finnegan; State Superintendent of Schools, John Callahan.

Judiciary. Supreme Court: Chief Justice, Marvin B. Rosenberry; Justices, Chester A. Fowler, Oscar M. Fritz, Edward T. Fairchild, John D. Wickhem, George B. Nelson, Joseph Martin.

WISCONSIN, THE UNIVERSITY OF. A State institution of higher education in Madison, founded in 1848. The enrollment for the autumn term of 1935 was 9065, distributed as follows: Letters and science, 5437; engineering, 1058; agriculture (including home economics), 1022; education, 650; law, 409; medicine, 306; nursing, 144; and library school, 39. In the 1935 summer session the enrollment was 4212. The faculty numbered 1464. The endowment as of June 30, 1935, was \$1,409,098, while the net income for 1934-35 was \$6,765,227. Gifts received during the year were valued at \$352,765. The library contained 966,000 volumes and 460,000 pamphlets. President, Glenn Frank, M.A., Litt.D., L.H.D., LL.D.

WISCONSIN ACT. See UNEMPLOYMENT.

WITHERSPOON, WITH'er-spōon, HERBERT. An American basso, died in New York City, May 10, 1935. Born in Buffalo, N. Y., July 21, 1873, he graduated from Yale University in 1895, and later studied drawing and painting at the Yale Art School. His musical education was obtained in New York, London, Paris, and Berlin, under Horatio Parker, MacDowell, Treumann, Hall, Dubulle, Lamperti, and Henry J. Wood. He also studied acting with V. Capoul and Anton Fuchs in Munich.

His début was made in New Haven in 1895 as soloist with the Yale Glee Club, and in the following year he appeared as soloist with the New York Symphony Orchestra in a performance of *Parsifal*. From 1898 to 1900 he appeared in English grand opera under Henry W. Savage and his Castle

Square Opera Co., and first appeared as Ramfis in *Aida*. For many years he toured with the Thomas Orchestra and the Pittsburgh Orchestra.

In 1908, Mr. Witherspoon made his début with the Metropolitan Opera Company, New York, singing the off-stage music of Titirel in *Parsifal*. For eight years he remained with the Company, appearing in various Wagnerian rôles, including King Henry in *Lohengrin*, King Marke in *Tristan und Isolde*, Landgrave in *Tannhauser*, and Gurnemanz in *Parsifal*. He also sang Sarastro in *The Magic Flute*, and created the part of Arth in the world première of Parker's *Mona*, Nov. 14, 1912.

After leaving the Metropolitan, he devoted his time to concert work and teaching. He toured with the Chicago, Pittsburgh, Boston, and New York Symphony Orchestras, the New York Oratorio Society, the Mendelssohn Choir of Toronto; and appeared in festivals at Cincinnati, Worcester, Mass., Sheffield, Norfolk, and Norwich, England, and with the London Symphony and Queens' Hall Orchestras.

In 1925 he became president of the Chicago Musical College, which position he held until 1929, and during 1926 and 1927 he lectured on "Music as a Vital Factor in General Education." Appointed vice president and director of the Chicago Civic Opera Company, he held this position until the fall of the Insull interests in 1931, and the abandonment of plans for the future of the Opera Company. For a year, 1932-33, he was director of the Cincinnati Conservatory of Music, but in September, 1934, returned to New York to reopen his vocal studio. Early in 1935 he joined the faculty of the Juilliard Summer School, and in March announcement was made of his appointment as general manager of the Metropolitan Opera Company to succeed Giulio Gatti-Casazza. Although his connection with the Metropolitan as general manager was of short duration, he had made extensive plans and had tentatively engaged many new voices for the forthcoming operatic season. See MUSIC.

In 1922, Mr. Witherspoon was instrumental in the founding of the American Academy of Teachers of Singing, and until 1926 was its chairman. Also, he served as chairman of music at the Century of Progress Exposition in Chicago in 1933. His voice, which was rich and smooth, he used intelligently, and although not a remarkable or a brilliant artist, his work was dependable and agreeable.

WOMAN'S CHRISTIAN TEMPERANCE UNION, NATIONAL. An all-partisan and all-sectarian movement which has as its purpose the protection of the home through the abolition of the liquor traffic. It is comprised of 10,000 local unions with an approximate membership of 600,000, and is organized in every State, territory, and dependency of the United States. At the convention held in Atlantic City, New Jersey, Sept. 6-12, 1935, Mrs. Ida B. Wise Smith was reelected president and Mrs. Anna Marden De Yo, corresponding secretary. Great interest was manifested in the progress of the Five-year, Five-point Programme, majoring in alcohol education, to culminate in the observance of the Centenary celebration of the birth of Frances E. Willard in 1939. The organization maintains a legislative headquarters at 100 Maryland Ave., N.E., Washington, D. C. National headquarters are at 1730 Chicago Ave., Evanston, Ill.

WOMEN IN INDUSTRY. The codes established by the NRA did not, by and large, recognize the principle of equal pay for equal work, but continued to observe the traditional differential in

wages as between men and women, lower wages for women being characteristic. In April, 1930, 10,752,116 women told the census enumerators that they ordinarily worked for wages. This was a large increase over the number so reported in 1920. The depression came at a time when the rise in the number of working women had outstripped the growth of the female population in the United States. Women were chiefly employed, in 1930, in domestic service, clerical occupations, manufacturing, and mechanical industries, and professional service (60 per cent school teachers), the foregoing classification accounting for four-fifths of all women employed. Over half of the women do unskilled or semi-skilled work and the greater majority earn \$12 a week or less. Many of the occupations traditionally followed by women have been over-crowded for some time, including nursing, and secretarial and general office work. The limitation on opportunities for women seeking work was intensified by the depression. Their position was also made more difficult by the fact that when minimum wages were established in certain industries under the NRA, it ceased to be profitable to employ women workers in preference to men.

With the collapse of the NRA this competitive disadvantage was destroyed. Studies of wages earned made by the Women's Bureau, of the Department of Labor, from 1920 to 1934 yielded wage figures for about 180,000 women, almost all white, in 17 states. These figures indicate that the medians of the wage earnings—half of the women receiving more and half receiving less—were as follows: Under \$9, Alabama (1922) and Mississippi (1924); \$9 and under \$11, Kentucky (1921), South Carolina (1921), and Texas (1932); \$11 and under \$13, Arkansas (1922), (1932-33), Delaware (1924), Georgia (1920-21), Kansas (1920), Michigan (1934), Ohio (1922), Tennessee (1925); \$13 and under \$15, New Jersey (1922), Ohio (1922), and Oklahoma (1924); \$15 and under \$17, Florida (1928) and Rhode Island (1920).

Said the Women's Bureau report: "The responsibilities of the wage-earning woman and her contribution to the support of others, mother, father, sisters, brothers, husband, children, have not yet received full recognition from industry and the public." This statement clearly indicates the fact that the difficult competitive position of women in the modern industrial world will have profound influence on the general living standards of thousands of working class families in the next few years. With the removal of the bottom from the wage scales in the industries where the NRA prescribed minimum pay, it is likely that women will once more begin to replace men. On the other hand, there is evidence assembled by the Women's Bureau that shows a trend in the opposite direction in proportion as the number of unemployed men increases. Whichever tendency triumphs, according to the experts, the total effect is to reduce wages in the competitive occupations. Some indication of the effect of men and women competing is derivable from a study released by the Women's Bureau which states that "men working on punch presses get 45¢ an hour, women 25¢; on core making with the same size cores the men's rate was 52¢, the women's 35¢; on rivet the men get 60¢, the women 41¢." Another recent publication of the Women's Bureau entitled *Women and Work in Offices* reported that the medium earnings in this field were \$24.60, ranging from \$19.85 for cashiers or tellers to \$28.65 for secretaries. This is, of course, one of the fields in which women workers are found in large numbers.

In this field, also, the effect of mechanization is found, and it has been established by the Women's Bureau that shift from traditional to mechanized methods in, for example, the field of bookkeeping, has resulted in the lowering of earnings.

The women workers are also profoundly affected by industrial home work which was but partially outlawed by the NRA and which, according to studies lately released, has increased in volume since the collapse of the NRA. In a pamphlet entitled *The Commercialization of the Home Through Industrial Home Work* published by the Women's Bureau, it is pointed out that low priced home work tends to lower factory wages; that many families on the public relief rolls are found doing such work at home; that unemployment in the household tends to lead the homemakers to engage in such work; and that the difficulty experienced by married and unmarried women in finding employment in normal channels, leads them to resort to this type of labor. Under this system of production such products as artificial flowers, baseballs, dolls' dresses, fishing tackle, flags, greeting cards, lamp shades, domestic decorative linens, powder puffs, tobacco bags, cotton garments, lace, candlewick bedspreads, and art and needle work are produced. It is estimated that such work goes on in at least 77,000 homes scattered over 48 States (1930). While some types of home work have increased in recent years others have declined.

A special study of southern mountaineer handicrafts, which fall under the classification of home work, reveals that under the existing system of production control and distribution of work "it has not yielded over an average of a dollar a week per craftswoman and it has not guarded against working conditions that menace the health of the handicraft family." This situation is especially shocking when it is known that the market for the handicrafts is found chiefly among "the middle and upper income class" of the nation. The retail stores catering to the \$2000 and lower income classes carry imported handmade articles, but southern mountaineers, at a minimum of 30¢ an hour, could not offer goods in competition with these products. Therefore, while handicrafts in the southern mountains do not contribute to the economic well-being of the residents, they are to-day chiefly supported by the well-to-do in the nation at large.

Turning to the situation in Rhode Island, where one of the chief products of home work is lace, a special study leads to the conclusion that "practically three-fifths of the households had earnings for the previous week of less than \$6 and only about one-fourth had earned from \$6 to \$12." A Women's Bureau study entitled *Employment of Women in the Sewing Trade in Connecticut* reports that in the latter part of 1931 and the early part of 1932 women working in the necktie and cravat industry report medium earnings of \$16.15 while in the men's shirt industry the medium earnings were \$9.65. Analysis showed that one-third of the women in the sewing industry earned less than \$10 a week and that 513 women who were able to report, had medium earnings for a full year's labor of \$670. These earnings were for an average of 48 hours per week.

WOMEN'S CLUBS, GENERAL FEDERATION OF. An organization founded in 1889 for "the promotion of movements looking toward the betterment of life." In 1935 it was composed of approximately 14,500 clubs in the United States, having also a membership of 40,000 Juniors, and 84 clubs outside the mainland of the United States; affiliated

with it were 16 national and international organizations. The official publication is *The Clubwoman GFWC*. At the June, 1935, convention in Detroit, Mich., Mrs. Roberta Campbell Lawson was elected president for the ensuing triennial period. Headquarters are at 1734 N St., N. W., Washington, D. C.

WOODROW WILSON AWARD. See INTERNATIONALISM.

WOOL. Conditions in the wool textile industry of the United States and most foreign countries showed marked improvement in 1935 as compared with 1934. Wool prices improved steadily throughout much of the year with increased consumption stimulated by government contracts.

Preliminary estimates of the U. S. Bureau of Agricultural Economics indicated a total reduction of about 3 per cent in the wool production of most all of the more important producing countries. The five countries (Australia, New Zealand, Union of South Africa, Uruguay, and Argentina) furnish about 90 per cent of the world's wool exports. Wool production in these five countries was estimated at 1,899,000,000 lb., a decrease of about 4 per cent as compared with 1934. Wool carry-over was about 13 per cent smaller than in 1934. Production in 24 Northern and Southern Hemisphere countries furnishing about two-thirds of the world total supply outside of China and Russia was estimated at 2,751,000,000 lb., or 3 per cent less than in 1934.

Wool consumption in the United States increased especially during the latter part of the year. During 1935 domestic mill consumption of apparel wool totaled 303,893,000 lb. as compared with 167,600,000 lb during 1934.

The world's import trade in raw wool closely followed wool production in recent years, but there were important changes in the trade of individual countries. Imports of carpet wools into the United States during 1935, of 171,504,101 lb., doubled those of 1934. A downward trend in imports into France, Germany, and Belgium was offset by increased imports into the United Kingdom, Italy, and Japan.

The following articles relate to wool production and utilization: *Handling the Wool Clip*, by L. J. Horlacher (Ky. Ext. Circ., 72, 1935); *Wool Yield and Fleece Density Can be Measured by a Simplified Method*, by J. I. Hardy (U. S. Dept. Agr. Yearbook, 1934, pp. 378-80); *Studies of Wool and Other Fibers* (U. S. Dept. Agr., Bur. Anim. Indus. Rpt., 1934, p. 11); *The Influence of Various Kinds of Wool on Some of the Physical Properties of Flannel*, by E. Pierson (South Dakota Rpt., 1934, pp. 35-38); *The Tariff on Wool*, by H. R. Mohat (Tariff Res. Com., Agr. Tariff Ser. No. 5, Madison, Wis., 1935); *A Practical Laboratory Method of Making Thin Cross Sections of Fibers*, by J. I. Hardy (U. S. Dept. Agr. Circ., 378, 1935).

WORCESTER POLYTECHNIC INSTITUTE. A nonsectarian institution for the technical education of men in Worcester, Mass., founded in 1865. The enrollment for the fall semester of 1935 totaled 579. The faculty numbered 66. The productive funds amounted to \$3,425,634, and the income for the year was \$343,966. There were about 24,000 volumes in the library. President, Ralph Earle, D.Sc., D.Eng., LL.D., Rear Admiral, U.S.N., ret.

WORKMEN'S COMPENSATION. Accidents. The place of accidents in modern America was brought vividly to the fore at a conference called in Washington on Dec. 18, 1935, by Secretary of Commerce Roper. At that time it was brought out that no comprehensive and reliable statistics on the subject are available, but that a

tentative estimate is that 101,000 persons are killed in accidents each year, and 9,000,000 are injured. In order of the toll exacted, accidents take place on the highway (motor vehicle accidents), at home, in public places, and at work. In opening the conference Mr. Roper stated:

The national accident situation truly is an astonishing one. It is almost inconceivable that a condition could exist where so many lives were being lost, so little information about the real causes of these fatalities being gained and so little effort being made to prevent these tragic deaths and injuries.

In an effort to meet the situation, a comprehensive plan of study is to be worked out by a group of committees which will deal with the separate aspects of the problem. The committees and their chairmen were as follows:

Causes and Remedies—Henry H. Heimann, Niles, Mich.
Rural and Home Accidents—Senator Arthur Capper, Topeka, Kan.
Urban Street Safety—Thomas J. Watson, New York City.
Cooperation With Common Carriers—W. Averell Harrison, New York City.
Cooperation With the Automotive Industry—John L. Lovett, Detroit.
Uniform Traffic Regulations—Representative Emmet O'Neal, Louisville.
Driver Training and Law Enforcement—Dr. B. L. Corbett, Milwaukee.
Education—Barron G. Collier, New York City.
Cooperation With Safety Groups—Fred M. Rosseland, Newark.
Safety in the Air—Senator W. G. McAdoo, Los Angeles.
Safety at Sea—Walter Parker, New Orleans.

Accidents in Industry. Turning to the general problem of accidents in industry, a study made by the Public Health Service in 10 States revealed that the highest accident rate was to be found among unskilled laborers and the lowest among professional men. When these figures were considered in relation to the death rates of the different occupational groups, it was discovered that while unskilled laborers still had the highest rate, the lowest was to be found among agricultural laborers, the professional men being, however, below the "all class" average of 8.7 deaths per 1000 population. Consideration of specific diseases showed that the unskilled workers are especially subject to death from tuberculosis and pneumonia. These points are made clear in Tables I and II.

TABLE I

Occupation	Deaths per 1,000 population
Agricultural workers	6.2
Professional men	7.0
Proprietors, managers, and officials	7.4
Clerks and kindred workers	7.4
Skilled workers and foremen	8.1
Semi-skilled workers	9.9
Unskilled workers	13.1
All classes	8.7

TABLE II

Occupation	Deaths per 1,000 population		
	Tuberculosis	Pneumonia	Accidents
Agricultural workers	46.5	43.4	15.1
Professional men	26.2	38.8	14.5
Proprietors, managers, and officials	43.2	53.0	22.3
Clerks and kindred workers	65.8	50.5	18.7
Skilled workers and foremen	72.1	59.7	34.2
Semi-skilled workers	102.1	71.6	34.1
Unskilled workers	184.9	135.9	51.7
All classes	87.5	69.3	29.5

A conference of the International Association of Industrial Accident Boards and Commissions was held at Asheville, North Carolina, beginning Sept. 30, 1935, and continuing for four days. A wide range of topics was discussed, including types of

legislation already enacted, safety codes, rehabilitation after injury, medical problems, and costs, as well as industrial diseases, including lead poisoning, the determination of permanent disability, and accident prevention in general, a subject of especial interest to the Roper conference which met six weeks later. The conference was marked by the attendance of representatives of the new industrial commissions of Florida and South Carolina. The former State established a system of workmen's compensation which became effective on July 1, 1935, and which is to be administered by a commission of three members. The act covers non-elective public employees, all employees of public and quasi-public corporations, and all private industries having three or more employees. Exempted were workers in domestic service, agricultural and horticultural farm laborers, and workers in tractor and other sawmills with less than 10 employees. An employer must insure his risk either in a stock or mutual insurance company, or provide self insurance. Under the South Carolina act, which became effective on Sept. 1, 1935, all public employment other than elective officers, and all private employment in which there are 15 or more employees, are covered. Exempt are railroads, domestic service, sawmills, agriculture, steam laundries, rock quarries, sand mines, oil mills, logging operations, and Federal employees. An employer must insure his risk in an insurance company or furnish proof of his financial ability to satisfy his obligations under the act. There are now but two States which do not offer protection to workers in industry, Arkansas and Mississippi.

The rise in volume of employment has been accompanied by a rise in fatal accidental injuries arising out of or in the course of employment. This is illustrated by a report of the Metropolitan Life Insurance Company covering the situation for 1934. Basing the figures on the holders of policies in this company, it was discovered that there was an increase of 11.3 per cent over 1933. All causes but two showed marked rises, ranging from 11.1 in the case of steam-railroad accidents, to 100 in the case of street railways. The two causes showing a contrary trend were accidental burns which declined 30.8 per cent and traumatism in mines and quarries which declined 25 per cent. (See Table III.)

Workmen's Compensation. A number of interesting decisions in workmen's compensation cases were rendered during the period. A selection follows: (a) the Supreme Court of Colorado held that the murder of an employee on duty was a compensable accident; (b) the Supreme Court of Ohio held an injury suffered during a labor dispute was compensable; (c) the U.S. Supreme Court held

that an employee hired in one State for employment outside the State, and injured in the course of work, is compensable; (d) the Supreme Court of Tennessee held that the death of an employee killed while driving at excessive speed was a compensable accident; and (e) the Supreme Court of the United States denied that a seaman was entitled to extra compensation because of alleged violation of established working conditions on the part of the employer. See **INSURANCE**.

Recent figures on industrial accidents in Canada, and on industrial accidents and illness in the Soviet Union are presented in accompanying Tables IV and V.

TABLE IV—FATAL INDUSTRIAL ACCIDENTS IN CANADA, 1933 AND 1934

Industry	1934		1933 *	
	Num-ber	Per cent of total	Num-ber	Per cent of total
All industries	974	100.00	808	100.00
Agriculture	150	15.40	111	13.74

* Exclusive of deaths in collisions between automobiles and railroad trains or engines, and between automobiles and street cars.

WORKS PROGRESS ADMINISTRATION (WPA). See WELFARE WORK; UNITED STATES under *Administration*.

WORLD COURT. The World Court is at present composed of 15 judges and 4 deputy judges, and ordinarily sits as a full court. The number of judges normally required to constitute the full court is 11. This number may, if necessary, be made up by calling upon the deputy judges. If it is impossible to obtain the presence of 11 judges, the Court may sit with 10 or 9 members. The ordinary session of the Court opens on February 1 of each year. Extraordinary sessions are summoned, whenever desirable, for instance, when a case submitted to the Court is ready for hearing and adjudication.

The Court has jurisdiction to deal with disputes in two different sets of circumstances: 1. The jurisdiction is said to be voluntary where two States by a special agreement submit a certain dispute to the Court for judgment. 2. The jurisdiction is said to be compulsory, that is, a State can summon another State to appear before the Court with or without its consent.

The Court has jurisdiction over the interpretation of a treaty; any question of international law; over legal disputes concerning the existence of any fact which, if established, would constitute a breach of an international obligation; over the nature or extent of the reparation to be made for the breach of an international obligation.

Compulsory jurisdiction of the Court extends over a large field, including treaties of arbitration, any dispute arising out of the interpretation and application of any of the Articles dealing with ports, waterways, and matters of transportation; disputes relating to the Kiel Canal; disputes arising between Czechoslovakia and Austria over the telegraphic and telephonic systems of those countries; and over certain numbers of international agreements concerning special rivers.

Forty-nine states have ratified the Statute of 1920 under which the Court was organized. The various protocols adopted since 1920 have been ratified by a varying number. On Dec. 31, 1934, 41 states had ratified the protocol adopted to meet the views of the United States of America, but on January 29, by a vote of 52 in favor to 36 against (a two thirds majority being necessary), the Senate decided not to adhere to this international tribunal which sits in the Peace Palace at The Hague.

Presidents of the United States have advocated a World Court of some kind since 1899. Presidents Harding, Coolidge, and Hoover, advocated this specific World Court. President Roosevelt urged our adherence to it in a message to Congress in December, 1934, declaring that "the United States has an opportunity once more to throw its weight into the scale in favor of peace."

The Hearst press, it was generally agreed, had something to do with this latest rebellion. Before the vote on the Court was taken it thundered: "The way to keep America out of the League of Nations trap—and the only way—is to keep America out of the League Court! Telegraph your Senators at Washington today, and tell them this!" Quite as effective was a Sunday afternoon radio sermon delivered by the Rev. Charles E. Coughlin of Detroit. An analysis of the vote showed that on the basis of 1932 election figures they represented 28,306,300 voters, or 60.8 per cent, and 75,769,580, or 63.1 per cent of the total population (1930 census). The 36 Senators who voted against the

World Court represented 18,272,210 or 39.2 per cent of the 1932 popular vote, and 44,335,715, or 36.9 per cent of the population. This action of the Senate means delay, but not necessarily final defeat.

Prof. Manley O. Hudson was nominated by the American group to succeed Frank B. Kellogg as judge on the World Court. This, according to general practice, virtually assured his election by the League Assembly next fall. Judge Kellogg resigned in September because his health was not such as to make advisable the frequent trips across the Atlantic required by service on the Court. He had been a judge at The Hague for five years.

World Court judges do not represent the nations of which they are citizens, but are chosen because of their qualifications as international jurists. It has, however, been the practice to select a man of the essential background and qualities, when he is available, of the same nationality as the judge whose place is to be filled. On September 14th the Assembly and Council of the League of Nations elected Haruichi Nagaoka of Japan as a member of the Court to fill the seat left vacant by the death of Mineichiro Adachi.

The thirty-fourth (ordinary) session of the Court, which opened on Feb. 1, 1935, ended on April 10th. At a public sitting held on April 6th, the Court delivered an advisory opinion upon a question submitted to it by the Council of the League of Nations in January, 1935, and relating to the situation of minority schools in Albania. This question was as follows:

Whether, regard being had to the above-mentioned Declaration of Oct. 2, 1921, as a whole, the Albanian Government is justified in its plea that, as the abolition of the private schools in Albania constitutes a general measure applicable to the majority as well as to the minority, it is in conformity with the letter and the spirit of the stipulations laid down in Article 5, first paragraph, of that Declaration.

The Court answered the question in the negative by eight votes (M. Guerrero, Vice-President, Baron Rolin Jaquemyns, M. Fromageot, M. Altamira, M. Anzilotti, M. Urrutia, M. Schucking, Jonkheer van Eysinga) to three (Sir Cecil Hurst, President, Count Rostworowski, M. Negulesco). The three judges composing the minority attached to the Opinion a joint dissenting opinion.

The origin of the question and the reasoning of the Court may be briefly summarized as follows:

Albania was admitted to membership of the League of Nations in 1920, on the understanding that with regard to the protection of minorities in her territory she should assume obligations in accordance with the general principles laid down in the Minorities Treaties. Albania's undertaking was given in the form of a Declaration which she signed on Oct. 2, 1921, and which was officially transmitted to the Council. The clauses of the Declaration, although, generally speaking, they follow the corresponding clauses of the Minorities Treaties, differ from them in some respects.

Under the Declaration, Albania had to furnish the Council with information concerning the legal status of minorities. It appears from the information supplied that the latter had the right to maintain and establish private schools.

In 1923, the Albanian Government manifested the intention of abolishing the right to maintain and establish private schools; but this right was preserved in the Constitution of 1928. In 1930, however, Albania took steps with a view to the secularization of education, and, in 1933, the abolition of private schools was completed by means of an amendment to the Albanian Constitution.

Following upon these events, petitions were addressed to the League of Nations on behalf of the minorities; in accordance with the procedure in force, they were referred to a Committee of three members, who decided to have the question of the scope of the Albanian Declaration concerning minorities, in regard to certain points, placed on the

Council agenda. The Council then decided to consult the Court.

In its opinion, the Court observes that the two opposing standpoints are as follows: On the one hand, that the Declaration imposed on Albania no other obligation in educational matters than to grant to members of minorities a right equal to that possessed by other Albanian nationals; on the other hand, that the fundamental idea of the Declaration is to guarantee to members of minorities freedom of education by granting them the right to retain existing schools and to establish others. According to the first standpoint, any interpretation which would compel Albania to respect the minority schools, though other Albanian nationals were no longer entitled to have private schools, would create a privilege in favor of the minority and thus run counter to the essential idea of the law governing minorities; according to the other standpoint, equality of treatment cannot impede the purpose of the Albanian declaration which is to ensure full and effective liberty in matters of education.

In presence of these two conflicting contentions, the Court in construing the declaration adopted the point of view of the general principles laid down in the minorities treaties.

In this connection, it observes that the idea underlying the treaties is to ensure that the majority and minorities may "live peaceably" side by side and "cooperate amicably," whilst preserving the characteristics of the latter. In order to attain this object, they lay down the principles of equality and of granting minorities means for the preservation of their traditions and characteristics. The two principles are moreover interlocked, for there would be no true equality between a majority and a minority if the latter were deprived of its own institutions and were consequently compelled to renounce that which constitutes the very essence of its being as a minority.

The Court next observes that the Albanian declaration is also inspired by these principles: besides providing for equality of treatment, it specifies the rights that are to be enjoyed equally by all persons whom it covers, including particularly members of minorities.

To the latter the declaration ensures "the same treatment and security in law and in fact" as other Albanian nationals. The Court holds that this is a notion of equality which is peculiar to the relations between a majority and a minority, and the characteristic feature of which is equality *in fact*. Equality in fact supplements equality in law; it excludes a purely formal equality and may involve the necessity of different treatment in order to establish an equilibrium between different situations.

In the Court's view, this is precisely what the declaration does when it provides that minorities are to have the right to maintain and establish institutions such as schools. The requisite equality of treatment would be destroyed if these institutions were abolished or replaced by State institutions.

In this connection, the Court also observes that the expression *equal right* means that the right thus conferred on members of the minority cannot in any case be inferior to the corresponding right of other Albanian nationals: it is the minimum necessary to guarantee effective and genuine equality as between the majority and the minority. Far from creating a privilege in favor of the minority, it ensures that the majority shall not be given a privileged situation as compared with the minority. The Court finds, moreover, that the view taken by it is confirmed by the history of the relevant provisions and by their context.

On Dec. 4, 1935, the Court delivered the Advisory Opinion for which it had been asked by the Council of the League of Nations on the question whether two decrees issued by the Senate of Danzig on Sept. 5, 1935, and amending the criminal law and procedure of the Free City were "consistent with the Constitution of Danzig, or, on the contrary, violate any of the provisions or principles of that Constitution."

The Court, by nine votes to three gave the following answer: that the decrees in question are not consistent with the Constitution and that they violate certain provisions and certain principles thereof. See DANZIG under *History*.

In its Opinion, the Court observes in the first place that though, in order to give the opinion for which it is asked, it must examine the domestic legislation of the Free City, including the Constitution of Danzig, the problem submitted to it nevertheless contains an international element resulting from the fact that the Constitution is placed under the guarantee of the League of Nations. The question had been brought before the Council

by the High Commissioner of the League of Nations at Danzig, who had himself received a petition from three political parties at Danzig, other than the national socialist party which is in power. In the contention of the petitioners, the amendments made by the impugned decrees in the Danzig Criminal Law open the doors wide to arbitrary decisions and violate two articles of the Constitution of the Free City.

The Court pointed out that any inconsistency between the decrees—which have been issued by the Senate under a law empowering it to legislate by decree within certain very wide limits—may be due either to inconsistency between the terms of the decrees and the articles or principles of the Constitution, or to the fact that the decrees overstep the limits of the powers given to the Senate or to the fact that the law conferring these powers may itself be contrary to the Constitution.

Observing, in the first place, that what it has to examine is whether the decrees as they stand are necessarily in conflict with the Constitution so that they cannot be applied without violating it, and in the second place, that if any article or principle of the Constitution is violated by the decrees, that will suffice to show that the latter are not consistent with it, the Court proceeds to consider the question from the point of view of the contents of the decrees.

Examining the decrees, the Court found that they replace the rule previously in force at Danzig—to the effect that an act was punishable only if the penalty applicable to it were prescribed by a law in force before the commission of the act—by a rule to the effect that an act is also punishable, even if there is no particular penal law applicable to it, if it deserves punishment according to the fundamental idea of some penal law and according to sound popular feeling. The Court, analyzing this innovation, arrived at the conclusion that, under the system inaugurated by the decrees, what will be applied will not be the text of the law itself—which would be equally clear both to the judge and to the accused—but what the judge, in his own judgment, believes to be in accordance with the fundamental idea of the law and with sound popular feeling. Thus a system under which the criminal character of an act and the penalty attached to it are known to the judge alone replaces a system in which this knowledge was equally open to both the judge and the accused. Moreover, opinion as to what is condemned by sound popular feeling—a very elusive standard—will vary from man to man.

Proceeding next to analyze the Danzig Constitution, the Court lays stress on certain principles emerging from it. In the first place, according to its Constitution, the Free City is a *Rechtsstaat* (State governed by the rule of law); secondly, the Constitution provides for a series of fundamental rights the free enjoyment of which it guarantees within the bounds of the law; the Danzig Constitution even lays very special emphasis on the importance and inviolability of the individual liberties which ensue from these fundamental rights. These liberties are not all absolutely unrestricted; but they can only be restricted by law. This, in the view of the Court, involves the consequence that the law itself must define the conditions in which such restrictions of liberties are imposed; for if a law could simply give a judge power to deprive a person of his liberty, without defining the circumstances in which his liberty might be forfeited, it could render entirely nugatory

tory the guarantees provided in certain articles of the Constitution.

Lastly, comparing the results of its analysis of the decrees in question and of the Constitution, the Court finds that, so far from supplying the limitation required by the Constitution, the decrees empower a judge even to punish an act not prohibited by law, provided that he relies on the fundamental idea of a penal law and on sound popular feeling. They transfer to the judge, therefore, an important function which the Constitution intended to reserve to the law. The Court recognizes that a criminal law sometimes and within certain limits leaves the judge to determine how to apply it; but it considers that, in the present case, the discretionary power is too wide to allow of any doubt but that it exceeds these limits. The Constitution treats the problem of the repression of crime from the standpoint of the individual, whom it aims to protect against the State; the decrees, on the other hand, treat the problem from the standpoint of the community, their aim being to protect the latter against the criminal.

The Court therefore arrived at the conclusion that the decrees are not consistent with the guarantees provided by the Constitution for the fundamental rights of individuals.

WORLD LEAGUE AGAINST ALCOHOLISM. An international organization for education on the alcohol problem, established at Washington, D. C. in 1919, by representatives of national temperance organizations from 11 countries. Membership in this League is limited to temperance organizations that are national in the scope of their operations. In 1935 the membership consisted of 60 such national temperance organizations in 34 countries. The executive offices are at Westerville, Ohio, and Washington, D. C. The Scientific Temperance Federation, with headquarters at Boston, acts as the scientific research department for this League, and the Intercollegiate Association for Education on the Alcohol Problem, with headquarters at Washington, D. C., is the student department of this League. All the activities of the League are under the direction of the General Secretary, Ernest H. Cherrington.

WORMS. See ENTOMOLOGY, ECONOMIC.

WRESTLING. Danno O'Mahoney, an Irishman, took over the world's heavyweight wrestling championship, at least that championship viewed with approval and sanctioned by more ruling athletic commissions than any other, in 1935. The big Irish lad arrived in the United States late in December, 1934, and proceeded to mow down all opponents without a loss. O'Mahoney did most of his grappling in Boston and developed into a superior drawing card there and in mid-June tossed Jim Londos for the title. A month later he pinned Chief Little Wolf at the Yankee Stadium, New York, and back in Boston in the autumn he threw Ed Don George before 30,000 persons, to clamp down his claims to supremacy. Other "world's champions" recognized in outlying parts of the country were Vincent Lopez in California, and Everett Marshall in Colorado.

The wrestlers of Oklahoma A. and M. won both the N.C.A.A. and A.A.U. tournaments and Lehigh's grapplers were again victorious in the Eastern collegiate championships.

WÜRTEMBERG. See GERMANY.

WYOMING. Population. On Apr. 1, 1930 (Fifteenth Census), 225,565; July 1, 1934 (latest Federal estimate), 232,000; 1920 (Census), 194,-

402. Cheyenne, the capital, had (1930) 17,361 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops for 1935 and 1934:

Crop	Year	Acreage	Prod Bu	Value
Hay (tame)	1935	818,000	1,115,000*	\$8,028,000
	1934	665,000	670,000*	8,643,000
Sugar beets	1935	41,000	530,000*
	1934	42,000	434,000*	2,166,000
Potatoes	1935	27,000	2,430,000	1,701,000
	1934	25,000	1,000,000	790,000
Wheat	1935	222,000	2,385,000	2,159,000
	1934	130,000	1,041,000	907,000
Corn	1935	229,000	2,519,000	1,763,000
	1934	131,000	655,000	655,000
Oats	1935	137,000	3,562,000	1,354,000
	1934	83,000	1,743,000	959,000

* Tons.

Mineral Production. The mining of coal increased moderately, to a yearly total of some 5,150,000 net tons (1935) from 4,367,961 (1934). The production of petroleum recovered, to a yearly total of about 13,065,000 barrels for 1934, from 11,227,000 barrels for 1933. The decline in the yield of the main field, the Salt Creek, was more than offset by successful development in other fields. In spite of the scarcity of profitable outlets for natural gas, its annual production attained about 26,000,000 Mcu ft. for 1934. Some 34,900,000 gallons of gasoline were derived from natural gas in 1934.

Education. The number of the inhabitants of school age was reported for the academic year 1934-35 as 71,055. The enrollments of pupils in the public schools numbered 57,082. Of these, 42,448 were in common schools or elementary grades, and 14,634 were in high schools. Both the enrolled groups were greater than they had been the year before. The year's expenditures for public-school education exceeded those for the year previous and attained \$5,398,438. The pay of teachers for the year, averaged by groups, was \$600.47 for rural schools; for elementary graded schools, and for special teachers, \$1142.28; for high schools, \$1192.12.

The University of Wyoming continued to conduct courses by correspondence, for the further education of unemployed graduates of the high schools.

Charities and Corrections. Charge of the State-maintained institutions for the care and custody of persons rested, in 1935, in the Board of Charities and Reform. This body was composed of five ex-officio members, namely: the Governor, Secretary of State, Auditor, Treasurer, and Superintendent of Public Instruction. The institutions under the Board's control were: the State Penitentiary, State Penitentiary Farm, Wyoming General Hospital, State Hospital (for the insane), Training School (for the feeble-minded and epileptic), Tuberculosis Sanatorium, Wyoming Industrial Institute (boys), Girls' Industrial Institute, Soldiers' and Sailors' Home, and State Home for Dependent Children. The Board also handled applications for pardons and supervised the Hot Springs State Park and the Saratoga Hot Springs State Reserve.

Legislation. A system of control over the traffic in alcoholic liquor was created; a State Liquor Commission received broad powers, enabling it to exercise a monopoly of the wholesale traffic. The retailers were obliged to pay \$1500 a year each for a license to serve drinks; drug stores might sell by the bottle on prescription.

Death by lethal gas was made the State's form of capital punishment. Persons who had resided in the State for 60 days were allowed to bring action

for divorce; but another bill, permitting divorce to be granted in some cases without corroborative evidence, was vetoed. A tax on retail sales was enacted.

Political and Other Events. The State Liquor Commission put in effect on April 1 its monopoly of the wholesale liquor business in the State, becoming the sole lawful purveyor to the retailers. It hoped by its monopoly to prevent the sale of illicit liquor.

The State Prison's manufactory of shirts at Rawlins was forced to close after the passage of the Federal Cooper-Hawes Act forbidding interstate transportation of prison-made goods. Preparations were made for the prison manufacture of woolen material for use within the State. See DUST STORMS.

Officers. The chief officers of the State, serving in 1935, were: Governor, Leslie A. Miller; Secretary of State, Lester C. Hunt; Treasurer, Kirk Baldwin; Auditor, William Jack; Attorney-General, Ray E. Lee; Superintendent of Public Instruction, Jack R. Gage.

Judiciary. Supreme Court: Chief Justice, Ralph Kimball; Associate Judges, Fred H. Blume, W. A. Riner.

WYOMING, UNIVERSITY OF. A State institution of higher education at Laramie, founded in 1886. The enrollment for the autumn term of 1935 was 1500. The 1935 summer session had an attendance of 1203. The faculty numbered 118. The productive funds amounted to \$2,583,097. There were 82,514 volumes in the library. The Wyoming Individualized Programme Plan was introduced, and a new Liberal Arts Building was opened and a U.S. Petroleum Research Laboratory established. President, Arthur Griswold Crane, Ph.D.

YACHTING. Yachtsmen had a very successful season during 1935, more races being run with more yachts entered in them. Gerald B. Lambert took the *Yankee* to England and achieved considerable success, winning eight races.

The trans-oceanic race of 3050 miles, from Newport, R. I., to Bergen, Norway, was won by Philip Le Boutillier's *Stormy Weather*, skippered by Roderick Stephens, Jr., and although it was the second to arrive, with its time handicap, made the best time of 19 days, 5 hours, and 28 minutes (June 6-July 2). This yacht also won the Fastnet race of the Royal Ocean Racing Club. Stephens sailed the winning *Dorade* in 1933. During the ocean race, three members of the crew of the *Hamrah* were swept overboard in a storm, and the yacht put back to port.

Harold S. Vanderbilt's *Prestige* won both the Astor Cup Race, sloop division (August 21), and the King's Cup Race (August 22). R. B. Metcalf's *Sachem* won in the schooner division of the Astor Cup Race.

The Seawanhaka Cup was retained by the Seawanhaka-Corinthian Yacht Club, P. V. Shields piloting the winning boat. In a team match, however, the Scandinavian crew (Norway, Sweden, and Denmark) defeated the Americans.

Adrian Iselin's *Ace* acquired the Bacardi Trophy, the Cup of Cuba, the Bermuda Challenge Trophy, and the Royal Bermuda Yacht Club Trophy during the winter racing in Bermuda. The woman's national sailing championship was won for the Cohasset (Mass.) Yacht Club by the Misses Frances McElwain, Frances J. Williams, and Katherine Johnson. Princeton was intercollegiate title winner.

YAKUTSK S.S.R. See SIBERIA.

YALE UNIVERSITY. A nonsectarian institution for higher education in New Haven, Conn., founded in 1701. The enrollment for the autumn of 1935 was 5493. Of the candidates for degrees or certificates, 660 were in the Graduate School, 1519 in Yale College, 468 in the Sheffield Scientific School, 192 in the School of Engineering, 878 in Freshman Year, 218 in the School of Medicine, 221 in the Divinity School, 381 in the School of Law, 368 in the School of the Fine Arts, 86 in the School of Music, 37 in the School of Forestry and 140 in the School of Nursing. The faculty numbered 881, not counting 721 assistants in instruction and administration. Irving Fisher, Professor of Political Economy, and Frank E. Spaulding, Sterling Professor of Education, retired at the close of the year 1934-35. Dr. Stanhope Bayne-Jones was appointed Dean of the School of Medicine. Two new appointments to professorships were those of Frederick S. Dunn as Professor of International Relations and James Grafton Rogers, as Professor of Law. Professor Rogers was also appointed Master of Timothy Dwight College, the ninth of the undergraduate colleges to be completed. The total endowment of the University amounted to \$95,838,568, and the income for the year was \$7,479,211. The libraries contained more than 2,400,000 volumes. For description of the college plan, which was made possible through gifts from Edward Stephen Harkness, see the NEW INTERNATIONAL YEAR BOOK for 1933. President, James Rowland Angell, Ph.D.

YOUNG MEN'S CHRISTIAN ASSOCIATION. An educational, social, physical, and spiritual movement for men and boys, which originated in London in 1844 under the leadership of George Williams. In 1935 there were in 54 countries of the world 9852 local associations, unions, or fellowships with a membership of 1,642,876. These associations employed 5217 officers and owned and occupied 2065 buildings. The United States had the largest membership (1,030,395) and the largest number of Y.M.C.A. buildings, representing a net property value of \$186,987,400. Local associations numbered 1148, with 3461 employed officers and 171,384 directors and committee men.

The general board of the associations in the United States is the National Council of the Young Men's Christian Associations, with headquarters at 347 Madison Avenue, New York City. Beatty B. Williams, president; John E. Manley, general secretary. The National Council is one of 33 national movements of federated local associations which constitute the World Alliance of Young Men's Christian Associations, with headquarters at 2 Rue de Montchoisy, Geneva, Switzerland. The president in 1935 was Dr. John R. Mott, of New York City. Tracy Strong, of Geneva, was general secretary.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. An organization whose purpose is to advance the physical, social, intellectual, and spiritual interest of young women. The first Association was formed in New York City in 1858. By 1935 there were throughout the United States 1021 Associations, affiliated in a national organization whose active body is the National Board of the Young Women's Christian Associations. Of these, 427 were in cities, towns, and rural communities, and 594 on college and university campuses. There also were 69 branches and centres for colored girls and women, 28 International Institutes, and 88 other

Associations working with foreign girls. During the past year there have been more than 2,000,000 women and girls served by the Y.W.C.A. of this country or taking some part in its programmes. Of these 2,000,000 about 407,000 were members, of whom 30,000 were student members. Among the others were Girl Reserves, the 'teen-age members; girls and women in industry; and business and professional women.

The organization employed in 1935, 2522 professional workers, of whom 2400 were connected with local Associations, 96 were on the national staff, and 26 were American secretaries serving in foreign countries. Working as volunteers, as board and committee members, and as advisers in local Associations were 79,000 women. The next biennial convention will be held in Colorado Springs, Colo., April 29-May 5, 1936. Mrs. Harrie R. Chamberlin of Toledo, O., is the president of the national organization. Mrs. Frederic M. Paist of Wayne, Pa., is president of the National Board, to which is entrusted the work of the national body during the interim of conventions. Headquarters of the National Board are at 600 Lexington Avenue, New York City, with Miss Anna V. Rice as general secretary and Miss Emma P. Hirth as associate secretary.

YOUTH PROGRAMME. See CHILD WELFARE; UNIVERSITIES AND COLLEGES.

YUGOSLAVIA. A kingdom in the Balkans Capital, Belgrade (Beograd). Sovereign in 1935, Peter II, who succeeded to the throne under a regency upon the assassination of his father, King Alexander I, on Oct. 9, 1934.

Area and Population. With an area of 96,010 square miles, Yugoslavia had a population estimated in 1934 at 14,730,000 (13,930,918 at the 1931 census). About 80 per cent of the people live on farms or in rural communities. Living births in 1933 numbered 451,514; deaths, 243,518; marriages, 111,418. Populations of the chief cities at the 1931 census were: Belgrade (Beograd), 241,542; Zagreb (Agram), 185,581. Subotica, 100,058; Sarajevo, 78,182; Skoplje, 64,807; Ljubljana, 59,768; Novi Sad, 63,966. In 1931 48.7 per cent of the population belonged to the Serbian Orthodox faith, 37.45 per cent were Roman Catholics, 11.2 per cent Moslems, 1.66 per cent Protestants, and 0.49 per cent Jews.

Education. About 41 per cent of the population was estimated to be illiterate in 1934, compared with 45 per cent at the 1931 census. School attendance in 1933-34 was: Elementary, 1,306,700; secondary, 88,639; university, 14,881.

Production. About 85 per cent of the population is directly or indirectly dependent upon agriculture. In 1932, 17,549,000 acres, or 20 per cent of the total area, was suitable for cultivation, 1,501,000 acres were under orchards, vineyards, and gardens, 15,057,000 acres in meadow and pasture, and 19,222,000 acres under forest. Agricultural production was valued at 12,048,000,000 dinars in 1932. The chief crops in 1934 were (in thousands of units): Wheat, 68,328 bu.; rye, 7688 bu.; barley, 18,744 bu.; oats, 22,972 bu.; corn, 202,912 bu.; wine, 102,146 gal.; prunes (exports), 48,500 lb. The 1934 potato crop was 1,843,800 metric tons; tobacco, 6000 metric tons; beet sugar (1934-35), 56,000 metric tons. Livestock in 1934 included 3,990,000 cattle, 2,792,000 swine, 8,868,000 sheep, 1,344,000 horses, mules, and asses, and 39,000 buffaloes. The normal timber cut is about 530,000,000 cu. ft. annually.

Mineral production in 1933 was valued at 1,159,016,000 dinars. Output of the chief minerals in 1934 was (in 1000 metric tons): Coal, 387; lignite,

3926; bauxite, 86; iron ore, 179; copper, 44.4; lead, 10.1; zinc, 4.4; chrome ore (1933), 23. Gold output in 1934 was 2219 kilograms; silver, 129,310 kilograms. Flour milling, brewing, distilling, cotton spinning and weaving, and boot, carpet, and pottery making are the principal manufacturing industries.

Foreign Trade. Imports for consumption in 1934 were valued at 3,573,298,000 dinars (2,882,516,000 in 1933) and exports at 3,878,203,000 dinars (3,377,845,000 in 1933). Cotton yarn, iron and steel, raw cotton, cotton fabrics, machinery, chemicals, and wool fabrics were the leading imports in 1934. The principal exports were (in 1000 gold dollars): Wood for building, 9131; corn, 7649; crude copper, 4710; fruits and nuts, 2330; swine, 2231; meat, 1892. Of the 1934 imports, Italy supplied 15.5 per cent; Germany, 13.9; Austria, 12.4; Czechoslovakia, 11.7; United States, 6.4. Of the exports, Italy took 20.6 per cent by value; Austria, 16.3; Germany, 15.4; Czechoslovakia, 11.3; and the United States, 4 per cent.

Imports in 1935 totaled 3,699,774,000 dinars; exports, 4,030,360,000 dinars. United States statistics for 1935 showed imports from Yugoslavia of \$3,971,233 (\$2,203,865 in 1934) and exports to Yugoslavia of \$801,997 (\$590,742 in 1934).

Finance. Excluding financial operations of state monopolies, hospitals, and public undertakings, the closed budget accounts for the fiscal year ended Mar. 31, 1934, showed a deficit of 186,100,000 dinars on total receipts of 6,467,100,000 dinars. On the same basis, the budget estimates for 1934-35 balanced at 6,914,400,000 dinars; on the basis of total budget operations, the 1934-35 estimates balanced at 10,171,250,000 dinars and the estimates for 1935-36 balanced at 10,364,000,000 dinars.

The public debt on July 1, 1932, totaled 38,783,558,000 dinars (external debt, 32,763,243,000 dinars). The dinar (par value, \$0.0298 in 1935) exchanged at an average of \$0.0164 in 1932, \$0.0176 in 1933, and \$0.0227 in 1934.

Communications. With 6343 miles of line (4019 miles under state operation) the Yugoslav railways in 1933 carried 31,631,000 passengers and 14,608,000 metric tons of freight, earning gross receipts of 1,781,281,000 dinars. Highways of all descriptions totaled 25,158 miles in 1933; navigable waterways, 1182 miles. Airlines connected Belgrade with Skoplje, Paris, Sofia, Bucharest, and Istanbul. The merchant marine on June 30, 1935, comprised 167 vessels of 347,018 gross tons.

Government. The Constitution of Sept. 3, 1931, declared Yugoslavia a constitutional monarchy, in which legislative power is vested jointly in the King and Parliament and executive powers in the King, acting through a ministry responsible to Parliament. Parliament consisted of a Senate of 76 members (29 appointed by the Crown and 47 elected) who serve for six years and a Lower Chamber (Skupstina) of 305 members elected for four years. The Regency appointed to govern during the minority of King Peter was composed of Prince Paul of Yugoslavia, a cousin of King Alexander; Radenko Stankovitch, and Dr. Ivan Perovitch. Premier at the beginning of 1935, Bogoljub Yefitch, of the Yugoslav National Party.

HISTORY

Internal Affairs. The struggle of the Croats, Slovenes, and other minority groups to break the domination of the Serb military dictatorship and secure a large measure of regional autonomy continued unabated during 1935. The stubborn re-

sistance of the Croats was reinforced by the influential support of Prince Paul, one of the three regents, and of Serb liberal groups who joined in working for the restoration of representative government and reconciliation of the diverse nationalities in Yugoslavia. This support enabled the minority groups to make a partially successful assault upon the dictatorship. The result, however, was to strengthen the Fascist tendencies of the majority Serb group, and by the end of 1935 the conflict between opposing political and racial factions had assumed even greater intensity.

The Yefitich Cabinet, formed Dec. 21, 1934, had made a step toward reconciliation of the Croats by releasing from prison Dr. Vladimir Matchek, the Croat leader. This move was followed, on Feb. 5, 1935, by the dissolution of the Parliament and the calling of new elections for May 5. The old Parliament, elected under a system which prevented all Opposition elements from registering their wishes, had been boycotted by the Croats and Slovenes. It was hoped that its dissolution presaged a return to democratic government, but the actions of the Yefitich Government soon indicated that it had no intention of permitting the free expression of popular opinion. On February 28 the Premier declared that there could be no return to the party system in effect previous to the dictatorship.

Although refusing to permit the Socialists and National Dissidents to participate in the elections, the government permitted Dr. Matchek's Croat Peasant party and two smaller Opposition groups to present candidates. Nevertheless it made sure of a victory by widespread terrorism, intimidation, and manipulation of the electoral machinery. According to final official returns the government secured 1,700,000 votes against 1,076,000 for the opposition, but due to the electoral system it won 310 seats in Parliament to 67 captured by the Opposition. The Croat Peasant party polled 983,248 votes. In Croatia it obtained from 80 to 90 per cent of the total votes cast, despite official obstruction and police terrorism. It was reported that at least 11 persons were killed and scores wounded during the election.

On the ground that the government's repressive measures and falsification of the electoral returns had violated the regency's pledge of a fair and free poll, the entire Opposition bloc, including Croats and some Serbs, voted to boycott Parliament until a neutral government dissolved it and held fair elections. The Archbishop of Zagreb, speaking for the Roman Catholic Croats, warned Prince Paul that a repetition of the repressive methods used in the May 5 election would provoke a revolution. The Croat position aroused the extreme Serb nationalist members of the Yefitich Cabinet to such violent threats and attacks that the more moderate cabinet Ministers felt obliged to dissociate themselves from these sentiments. Accordingly five Ministers resigned on June 20, causing the downfall of the entire cabinet.

Immediately after the Yefitich Cabinet's fall, Prince Paul invited Dr. Matchek to consult with him. This procedure, in striking contrast to the dictatorial methods in vogue at Belgrade during the preceding years, aroused new hope for a modification of Serb policy. The Croat leader's trip to the capital was in the nature of a triumphal procession, with crowds shouting "Down with dictatorship." During two interviews with Prince Paul Dr. Matchek reiterated the Croats' refusal to enter Parliament until it was dissolved and

fair elections held. He indicated, however, that his party would not oppose a neutral government which would prepare the way for new elections and reestablish personal and political liberty.

As a result of these negotiations, a new ministry was formed on June 24 under Dr. Milan Stoyadinovitch, a former Finance Minister who had opposed the dictatorship. Gen. Pera Zivkovitch, Premier under King Alexander's dictatorship, became Minister of War and Father Anton Koroschetz, leader of the Slovene party which had voluntarily boycotted the May 5 elections, was chosen Minister of Interior. Two other parties formerly proscribed by the government—the Serbian Radicals and the Bosnian Moslems—also obtained representation on the cabinet.

In his statement of policy before Parliament on July 4 Dr. Stoyadinovitch declared that while the government desired to restore parliamentary government, it would proceed gradually toward this goal. The unitary form of government would be retained and the old party system would not be restored. However, the Opposition demand for a more equitable electoral law would be granted and restrictions on the press and free assembly would be relaxed. As to foreign policy, the Premier forecast no change in the existing system of alliances with France, the Little Entente, and the Balkan Entente. Soon afterward he obtained Parliamentary authority to withdraw the restrictions upon the press, public meetings, and political parties. There was a rapid revival of political activity, and the autonomist movement in Croatia was more openly promoted. On August 19 General Zhivkovitch reported to Prince Paul that the police and Serb authorities in Croatia were being openly flouted. He demanded a return to the strong-arm policy by which the Croat agitation had previously been suppressed.

About the same time Dr. Stoyadinovitch undertook to stabilize his government and consolidate its power through the organization of a new political party representing all of the groups opposed to the former Yefitich Government except the Croat Peasant party, which was excluded. It included the Premier's Serbian Radical party, the Bosnian Moslems under Dr. Mehmed Spaho, and the Slovene Clerical party under Father Koroschetz. Committed to the monarchy and parliamentary democracy, this so-called Yugoslav Radical Union favored larger autonomy for the banats or provinces but was unwilling to accept the Federal system of completely autonomous regions advocated by the Croats. On August 23, soon after the announcement of the new party, three Croatian members of the cabinet resigned. They considered the new party an effort to perpetuate the Stoyadinovitch régime indefinitely.

Formation of the Yugoslav Radical Union also provoked the open hostility of the Yugoslav National Union under former Premier Yefitich, which still controlled a majority in Parliament and had the support of two of the three regents—Dr. Radenko Stankovitch and Dr. Ivan Perovitch. This powerful group showed pronounced tendencies to defend Serb domination by resorting to fascism. On October 20 it demonstrated its control of Parliament by defeating the government candidate for the speakership, 171 to 138. It then called upon Premier Stoyadinovitch to resign. The latter bluntly refused, pointing out that under the Constitution the government was not dependent upon parliamentary support. In this stand the Premier enjoyed the support of the previously

hostile Croats and Serbian Democrats. On November 13 the government won control of the five parliamentary committees, but by such a narrow margin that its position remained highly precarious to the end of the year. Dissensions among the groups forming the government coalition was reflected in the resignation of the Ministers of Public Works and Physical Training on December 20. Leaders of Dr. Stoyadinovitch's own Serbian Radical party were demanding the Premier's resignation.

Meanwhile the difficulties of satisfying Croat demands was indicated by a "minimum programme" outlined by Dr. Matchek in November. Croatia, he said, must have its own parliament, army, and complete control of its internal affairs, including the collection of taxes. The only tie between Croatia and Serbia would be a common Foreign Office and diplomatic service, a common War Ministry in Belgrade, and a Ministry of Finance authorized to collect and administer customs revenues only. There would be a joint Parliament at Belgrade composed of delegations chosen by the Croat and Serb parliaments. The response in Belgrade from both the government and the Opposition demonstrated that there was small hope of these demands being granted.

The government's troubles were not confined to these quarters. The widespread corruption prevalent in public and private life was demonstrated by a six-months' trial at Osijek of more than 100 persons, many of whom were prominent officials and business men, on charges of bribery, tax evasion, the forging of documents, and other offenses. Forty-eight were acquitted and the remainder were sentenced to prison for terms ranging from two months to eight years. On December 27 police announced that they had broken up a widespread Communist plot with ramifications throughout Yugoslavia and arrested some 200 alleged members of the conspiracy.

Economic Developments. The deflationary economic and financial policy followed throughout the depression was abandoned early in March by the Yefitch Government. The Ministry of Finance was given control over the State Mortgage, Postal Savings, and Privileged Agricultural Banks and authorized to adopt an "easy money" policy by reducing the gold cover to 25 per cent of sight obligations. Interest rates on loans and deposits were lowered; publication of the actual value of the dinar on local exchanges was resumed; and a two-year public works programme costing 1,000,000,000 dinars was launched, funds for which were to be raised by issuance of special 5- to 10-year bonds. The public works programme, inaugurated in May, was immediately reflected in increased employment and large purchases of materials throughout the kingdom. The continued budget deficit forced the government on September 19 to announce new reductions in living allowances of its officials and employees, anticipated to produce savings of 400,000,000 dinars.

Foreign Relations. The conclusion of the Franco-Italian agreement of Jan. 7, 1935, designed to preserve Austria's independence against Germany and to afford Italy a field for expansion in Ethiopia, was followed by a marked relaxation of tension between Yugoslavia and Italy, whose relations had been strained for more than a decade. Mussolini now abandoned his threatening attitude toward Yugoslavia, withdrew his support of Croat and Macedonian terrorists seeking to overthrow the Yugoslav régime, and modified his sup-

port of Hungary's drive for restoration by force of former Hungarian territories absorbed by Yugoslavia after the World War. The Italian Minister to Yugoslavia early in 1935 put forward radical and attractive proposals for the liquidation of Italo-Yugoslav differences. It was reported in March that Premier Yefitch planned to sign a commercial treaty with Mussolini in Rome as the first step toward a political agreement.

Before further action could be taken the European crises produced by German rearmament and by Mussolini's preparations to sabotage the League in order to conquer Ethiopia called a halt to the Italo-Yugoslav rapprochement. As a member of the Little Entente and Balkan Entente, Yugoslavia took a strong stand in defense of the League and of the League system of collective security. She joined unreservedly in the application of League sanctions against Italy, although the latter country took 20 per cent of all Yugoslav exports. Toward the end of the year, Yugoslavia pledged herself to go to the military aid of Great Britain in case the British fleet was attacked in the Mediterranean as a result of the enforcement of League sanctions. The threat of a European war growing out of the Anglo-Italian conflict over Ethiopia was considered at the annual meeting of the chief of staffs of the Little Entente powers held at Belgrade on November 24.

The conferences of the Little Entente Foreign Ministers at Bucharest on May 10-11 and at Bled, Yugoslavia, on August 29-30 reaffirmed their opposition to revision of the peace treaties and to the restoration of the Hapsburgs in either Austria or Hungary. Yugoslavia, however, continued its refusal to recognize the Soviet Union, despite the urgings of the other members of the Balkan and Little Ententes. With the decline of Italian influence in Central Europe, the pressure upon the small countries of that region to choose sides between Germany and the Soviet Union in the expected European war brought signs of division within these two combinations. Yugoslavia at the end of 1935 appeared to be moving toward an alliance with Germany, while Czechoslovakia and Turkey were already committed to cooperation with Russia. Relations with Hungary became much more friendly than in 1934 (see HUNGARY under *History*). The rapprochement between Yugoslavia and Bulgaria, inaugurated under the Georgiev dictatorship in 1934, was imperiled in 1935 by the triumph of King Boris and the pro-Italian party over the pro-Yugoslav forces in Bulgaria (q.v.).

See AUSTRIA, FRANCE, GERMANY, GREAT BRITAIN, GREECE, ITALY, RUMANIA, and TURKEY under *History*.

YUKON, yōō'kōn. A territory of Canada. Area, 207,076 sq. miles; population (1931 census), 4230. Dawson (capital) had 828 inhabitants; Whitehorse, 540. In 1933 there were 5 schools with 10 teachers, and 180 pupils.

Production. The mining of coal, copper, silver, lead, and gold was the main occupation of the people. Mineral production for 1934 (including Northwest Territories) was valued at \$1,669,159 including gold (38,799 oz. fine), \$1,338,566; silver (553,587 oz. fine), \$262,738. Birch, black spruce, white spruce, balsam, and poplar were the principal forest trees. Fur production (1933-34): 43,803 pelts valued at \$122,999.

Government. For the year ended Mar. 31, 1934, revenue amounted to \$168,686; expenditure, \$168,437. The Yukon was governed by a comptroller

and a territorial council of three elected members, and was represented in the Dominion Parliament at Ottawa by a member in the House of Commons. Comptroller, George A. Jeckell. See EXPLORATION.

ZANZIBAR PROTECTORATE. A British protectorate in East Africa consisting of the islands of Zanzibar (640 sq. m.; pop., 137,741) and Pemba (380 sq. m.; pop., 97,687). Total population (Jan. 1, 1935 estimate), 244,104 compared with 235,428 (1931 census). The capital town, Zanzibar, had 45,276 inhabitants.

Production. The production of cloves approximates 82 per cent of the world's supply. There were 3,500,000 clove trees on 48,000 acres in Zanzibar and Pemba. Practically all cloves are exported. Coconut bearing palms were estimated at 3,850,000.

Trade. In 1934, including reexports of Rs2,003,000 and specie of Rs292,000, exports totaled Rs10,200,000 (rupee averaged \$0.3788 for 1934) of which the main items were cloves (Rs6,369,000), clove stems (Rs324,000), and copra (Rs953,000); imports, inclusive of bullion and specie of Rs795,000, totaled Rs10,227,000.

Government. Revised estimates (1935): revenue, £431,035; expenditure, £430,613. Budget estimates (1936): revenue, £465,402; expenditure, £457,480. The nominal ruler in 1935 was the Sultan, Seyyid Sir Khalif bin Harub but actual control rested with the British Resident (in 1935, Sir R. S. D. Rankine).

ZINC. The mine output of recoverable zinc in the United States in 1935 amounted to 517,020 tons, an increase of 18 per cent over the production of 438,726 tons in 1934, according to a preliminary report of the U.S. Bureau of Mines. The Joplin region, the largest producing district in the country, advanced from a total of 153,092 tons in 1934 to 190,350 tons in 1935. Production in New Jersey advanced from 76,553 tons in 1934 to 86,260 tons. Zinc concentrates were priced at Joplin at \$26 a ton for the first five months of the year, rising from the middle of June to \$32 a ton in October, remaining at that price through the close of the year.

The American Zinc Institute reported a total production of slab zinc in 1935 of 431,085 tons in the United States, about a 20 per cent increase over the production of 367,000 tons in 1934. Stocks on Dec. 31, 1934, were 118,000 tons, but there were only about 84,000 tons on Dec. 31, 1935. In the consumption of zinc, about 100,000 tons were used in galvanizing, and something over that amount in the making of brass. Increasing lines of new consumption were in the use of zinc alloy die casting in automobile parts—hardware, carburetors, radiator grilles, etc.—and in new compounds for pigments, and to the use of zinc and zinc salts in orchards.

Outside of the United States, the total production of the world by primary metallurgical works, including zinc derived from dross and ashes in Belgium, France, and Germany, amounted to 1,034,124 short tons, according to a report of the American Bureau of Metal Statistics. This figure added to the production of the United States gave a grand total of 1,465,209 short tons for the world (1,301,595 short tons in 1934). By countries the 1935 production was: Other North America, 191,594 short tons; Belgium and Netherlands, 217,244 short tons; France, 57,416 short tons; Germany, 136,806 short tons; Italy, 28,950 short tons; Rhodesia, 23,103 short tons; Spain, 8430 short tons; Australia, 142,881 short tons, and the combined totals of production, partially estimated, of Nor-

way, Poland, Japan, Indo-China, Czechoslovakia, Yugoslavia, and Russia, 227,700 short tons.

The Canadian production, according to the Dominion Bureau of Statistics, amounted to 158,125 short tons (149,290 short tons in 1934).

The United States imported 10,497 tons of zinc ore in 1935, all from Mexico, and also 4479 tons of blocks, pigs, etc. Total exports of slabs, plates, blocks, pigs, rolled zinc, dross, and zinc dust amounted to 8505 tons. The export of galvanized products accounted for an estimated 12,800 tons in addition. See CHEMISTRY, INDUSTRIAL AND APPLIED.

ZIONISM. See JEWS; PALESTINE.

ZONTA INTERNATIONAL. An organization established in 1919 to "work for the advancement of understanding, goodwill, and peace through a world fellowship of executive women in business and the professions, united in the Zonta ideal of service." In 1935 there were 125 clubs in the United States, Hawaii, Canada, Germany, Austria, Australia, Denmark, and Sweden, with a membership of approximately 3300. Membership is limited to one outstanding representative for each business or profession in the community, who pledges herself to cooperate with others in its civic, social, and commercial development. The official monthly publication is *The Zontian*. Headquarters are at 59 East Van Buren Street, Chicago, Ill.; Miss Dora E. Neun, president; Miss Harriet C. Richards, executive secretary.

ZOOLOGY. The American Society of Zoologists met at Princeton, N. J., in December, 1935, under the presidency of R. W. Hegner. At the meeting of the British Association for the Advancement of Science at Norwich in September, W. A. F. Balfour-Browne was chairman of the zoological section. The International Congress of Zoology met at Lisbon in September with Arthur Ricorda Jorge as President and was attended by some 500 members. An important part of the programme was a meeting of the Committee on Zoological Nomenclature which is attempting to establish some uniformity in the usage of taxonomic names. At the British Association meeting was celebrated the centenary of Darwin's visit to the Galapagos Islands in September, 1835. It was announced at this meeting that the Ecuadorian government has set aside certain of these islands as wild-life reservations in commemoration of Darwin's visit. In *Half Mile Down* Beebe recorded observations made in the bathysphere at a depth of 3028 feet off Bermuda.

Since 1920 the programme of the American Museum of Natural History has included a study of the bird fauna of the Pacific Ocean. The latest expedition was the Crocker (financed by Templeton Crocker of San Francisco) which left late in 1934 and returned in April of 1935. Islands visited included Tahiti, Marquesas, and Pitcairn. Collections were made of materials for the preparation of bird groups. Important anthropological data were also secured.

General. To the zoologist of the early 19th century a species represented a definite act of creation and ability to recognize and call by name a large number of species was the mark of a great naturalist. Darwin's *Origin of Species* overthrew this belief and with the development first of observational and later experimental morphology the study of species as such fell into disrepute. Evidence of renewed interest in the species problem is shown by the fact that symposia on this subject were held by the Zoology section of the British Association at

its meeting in September and by the American Society of Zoologists meeting at Princeton in December. With the recognition of the fact that the animal body has a complex chemical composition it seems certain that true specific differences are due to chemical differences in the composition of the respective groups. If this be the case it is important that an experimenter should be certain that he is working with individuals of a definitely determined species since otherwise he might be in the position of a chemist who is using impure reagents. Evidence that such chemical differences do occur between different races of white rats was given by Loeb and King (*Am. Nat.* 69, p. 5). They stated that multiple characters determine individual differences and lead to incompatibilities when transplants are introduced into different organismal differentials. Balfour-Browne (*Nature* 136, p. 382), stated that if it were possible to accept the Lamarckian explanation the question of the origin of species could easily be settled but this is not possible with our present information. Evolution, he thought, is an inherent quality of a species and this may be orthogenesis or may arise through the action of external influences acting on mutating genes. Most species-characters are not vital and hence could not have arisen through natural selection.

Many animals are able to change their coloration or the degree of their surface shading in accordance with the character of their backgrounds. Change from light to dark and vice versa is due to differences in the arrangement of pigment in certain cells known as melanophores. In some cases these cell changes are under control of the nervous system; in others they are due to the action of hormones derived from the pituitary or adrenal gland. Parker (*Quart. Rev. of Biology* 10, p. 251), gave reasons for thinking that where nerves seem to control melanophores movement the real agents are "neurohumors" set free from the ends of nerves. Thus some of these hormones are carried by the blood, others by nerves. Two sets of neurohumors are recognized, the first water-soluble and transmitted through the blood and lymph, the other oil-soluble and transferred much more slowly by diffusion from cell to cell.

In studying ecological problems ecologists have concentrated their attention on plants or on animals as if the two were unrelated. Taylor (*Quart. Rev. Biol.* 10, p. 291), indicated the error in this point of view for each "biotic" community is composed of both plants and animals who are intimately correlated in the life of the community. It is not possible to affect one without modifying the other.

Limnology is a fairly recent development of ecology and is a study of the correlation between the geology, physics, chemistry, and biology of fresh waters. A comprehensive text book *Limnology* by Welch appeared in 1935, being practically the first general publication on the subject.

Annelids. The breeding behavior of some polychaetous annelids is to leave their burrows in the sand or in rock crevices and to swarm at the surface of the water while discharging their sex products. This swarming occurs in definite relation to certain phases of the moon. One species of the genus *Odontosyllis* in Bermuda and another in the Bahamas has this habit and at the time of swarming give off a considerable amount of luminescent material so that their paths through the water are marked by bright lights. Crowshay (*Nature* 136, p. 559), suggested that the mysterious light which Columbus reported having seen on his first visit to the West Indian Islands may have been the swarming

lights of this *Odontosyllis*. According to the records the moon would have been at that time in the proper phase.

Birds. Sheffer and Cottam (*U.S. Dept. Ag. Bull.* No. 467), reported that the Crested Myna or Chinese starling was introduced into Canada in 1897 and by 1925 the Vancouver colony was estimated to contain 20,000 individuals. Climatic and other conditions would make difficult their spread into the United States but danger of such invasion was noted. Hicks (*Bird Lore* Sept.-Oct., p. 303) gave data gathered in Ohio indicating that contrary to the usual belief the small bird population of the country is not decreasing. The last Congress appropriated \$6,000,000 for the establishment of more bird refuges. Campbell (*Bird Lore* Sept.-Oct., p. 321) stated that in a bird refuge in Three Lakes, Wis., it had been found unwise to attempt to kill predators since this upsets the balance of nature. The results of five years of this policy were uniformly satisfactory. The American Wild Life Institute founded in August, 1935, is supposed to be interested in wild life preservation but since among the founders there are manufacturers of guns and ammunition there is some doubt in the minds of ornithologists as to whether it will act as a conservation agency. Two important books by Herrick are *The American Eagle and Wild Birds at Home*. From the top of a 90 foot tower some 38 feet away from the eyrie of the eagle Herrick was able to observe and photograph many of its activities.

Coloration, CONCEALING. A perennial question (see earlier YEAR BOOKS) is whether the cases where animals resemble their normal backgrounds so closely as to be concealed from human vision really are benefited in the struggle for existence by such resemblances or whether these are merely accidental conditions of no significance. At one extreme are those who think that every resemblance is useful and has arisen through natural selection and at the other are those who hold that most if not all of such resemblances are of no benefit to the animal. The latter argument is based on the belief for which there is much evidence, that what appear to human vision as resemblances might not be so to the natural enemies of the animals in question whose sense organs are very different from ours. Sumner (*Am. Nat.* 69, p. 245), kept fishes in the dark and in the light and as a consequence had animals of very different degrees of shading. These fish were then put into a tank with fish-eating birds. Sumner thought his results indicated that the fish were definitely protected by their resemblance to their background. In another paper (*Proc. Nat. Acad. Sci.* 21, p. 345) Sumner described experiments with the fish *Gambusia* in relation to sunfish. The conclusion was that relative conspicuousness in a given environment determines the survival or not of small fishes. In this case quiescence is a handicap rather than an aid. Reinig (*Jour. of Ecol.* 30, p. 321) reported on observations made on bumble bees and the parasitic bees *Psithyrus* which live in the bumble bee nest. These latter in some cases show marked resemblances to their hosts leading to the suggestion that these resemblances have a protective function. In some cases it would seem probable that this is the case but there were so many exceptions that Reinig concluded that the similarities are due to parallel development in the two cases and are not in any way the result of natural selection.

Crustacea. Many physiological activities are carried on in a rhythmic fashion, these rhythms having a definite correlation with external influ-

ences such as daylight and darkness, high and low tide, etc., and in many cases persist when the immediate stimulus is removed. Pigment in the crustacean eye regularly moves to one position in the light and to another in the dark, the result evidently being to more efficiently utilize the respective degrees of illumination. Welsh (*Biol. Bull.* 68, p. 247), found not only that this rhythmical movement persists under changed light-conditions but he was able to locate a definite hormone responsible for the activity. Carlson (*Proc. Nat. Acad. Sci.* 21, p. 549), found that a substance set free from the middle portion of the eye stalk of the fiddler crab regulates the chromatophore activities of the animal, which immediately grows lighter if the stalk is cut off but darkens if an extract from the eye stalk is injected. Clarke and Gellis (*Biol. Bull.* 68, p. 231), reported observations on the food of marine copepods. In the familiar "food chain" of marine animals these crustacea play an important part since they make up a large percentage of the food of higher animals. It is of interest therefore to determine what is their food. The problem was not easy to settle under laboratory conditions but the authors concluded that bacteria make up the greater part. According to these results diatoms are of subordinate importance. Brown and Banta (*Physiol. Zool.* 8, p. 138), stated that in the *Cladocera* or "water fleas" overcrowding as well as food dilution definitely increases the proportion of male individuals.

Evolution. Zirkle (*Am. Nat.* 69, p. 417), showed that the doctrine of the inheritance of acquired characters commonly known as Lamarckism did not originate with Lamarck but had been accepted for at least 2000 years before his time. Among a long list of these earlier writers Zirkle was able to find only two who denied such inheritance. One was the unknown editor of Aristotle's *Historia Animalium* and the other was Immanuel Kant. The immutability of species was first generally held in the late 18th and early 19th centuries. Earlier workers believed in something very like mutation but this belief did not interfere with a general acceptance of the special creation hypothesis, since it was thought that these mutational changes were not cumulative. The doctrine of pangenesis proposed by Darwin is in its essence as old as Hippocrates for even then it was thought that all parts of the body contribute particles to the sex cells, this being Darwin's explanation of the mechanism by which changes in the body organs produce changes in the sex cells and hence in the individuals of the next generation.

Fishes. Breder and Negrelli (*Ecology* 16, p. 33), found that the sunfish *Lepomis auritus* in an aquarium would if the temperature were sufficiently lowered go into a condition of aggregation similar to the one they assume in nature on the approach of winter. Aggregations are not due to any gregariousness but because each fish orients himself against the current by viewing some stationary object. In an aggregation each fish is such a stationary object to every other fish. If light is withdrawn the aggregation breaks up. Since the effect of the respiratory current is to move the animal forward, they lie headed into a slight current and thus retain a stationary position. Meierhaus (*Comptes Rendus* 200, p. 582), reported experiments on fishes to determine the function of the swim bladder. That they are hydrostatic organs was shown by the fact that if the air is exhausted above the water gas bubbles are given off from the mouths of the fishes in amount determined by the extent of the decompression.

This may go so far as to completely empty the swim bladder.

Heredity. Earlier YEAR BOOKS have reported advances made from year to year in the study of Genetics (the name commonly used to mean a study of heredity from an experimental point of view), especially in its application to Mendel's law. Research in Genetics is largely concentrated on the one hand on the composition and arrangement of genes and chromosomes and on the other in recording applications and modifications of Mendelism. In either case the problems are so technical that a popular summary of them is out of the question. All results point to the existence of a hypothetical entity called a "gene" which occupies in Genetics the importance of the atom in Chemistry. It is the definite something which is responsible for hereditary transmission and several attempts have been made to determine its probable composition and size. Dumerac (*Am. Nat.* 69, p. 125), decided that the gene is a single molecule possessing the power of reproduction. Mutations, he thought, are due to changes of arrangement going on in the molecular group of the gene material which changes must be slight in amount as otherwise they would destroy the reproductive power of the gene. A notable discovery was that of the giant chromosomes (see YEAR BOOK for 1934), on which the localization of genes on the chromosomes is much more definite and certain than is possible elsewhere. Painter (*Genetics* 20, p. 301), reported progress in locating genes on these chromosomes and made some corrections in his earlier maps. Machensen (*Jour. of Hered.* 26, p. 123), gave further details of the technique of this investigation. Flies irradiated with X-rays often show definite deletions of parts of chromosomes, which deletions can be observed microscopically. A comparison of such deletions with earlier determined gene locations often shows that the genes which theoretically lie on the deleted regions are actually absent from the individual flies.

Insects. Since 1927 swarms of the Southern buffalo gnat have caused considerable losses among farm animals in the lower Mississippi Valley. Similar losses had occurred some 40 years earlier but in the interim little was heard of these pests. Bradley (*Science* 82, p. 277), pointed out the precise relation of this insect to Spring freshets. During these times enormous numbers of the insects come from "cut offs," "bays," and lakes formed by river overflows in Mississippi and Arkansas. Laboratory experiments showed that the eggs of the insects have a long incubation period which may be either in quiet or moving water. Under ordinary conditions eggs laid in these cut offs do not find conditions favorable for larval development but the waters provided by overflows give just the conditions needed for a long enough time to allow of development. The long incubation period is an adaptation to the situation where for several months these favorable conditions may not be present. Most insect pests are not native to the country in which they do their worst damage, the usual explanation being that in their native habitat they are kept in check by natural enemies which are absent in their adopted home.

What is said to be the first case on record where a native animal has been suppressed by the activity of an introduced one is given by Van Volkenberg (*Science* 82, p. 278), in a communication from Puerto Rico where the larvae of several native species of beetles of the genus *Phyllophaga* (or *Lachnosterna*) closely related to the June bug of the United States had done enormous damage to the sugar cane by attacks on its roots. Mechanical pre-

ventives as well as the introduction of insect parasites proved entirely without effect and from 1920 to 1924 Surinam toads (*Bufo marinus*) were imported from Barbados with the result that in 1933 it was found difficult to find enough of the grubs for experimental tests. Examination of toad stomachs showed that in addition to the May beetles other pests of the sugar cane were eaten. For a long time the Mediterranean fruit fly has been present in Hawaii and while it does not attack either sugar cane or pineapples which are the leading crops of the islands, it does destroy other fruits which might otherwise be profitably raised. Financed by a grant from the AAA, expeditions from the islands to Africa and Brazil started in 1935 in the expectation of finding insect parasites that would control the fruit fly.

In a number of other cases in Honolulu introduced parasites have proved most successful in controlling pests (*Science* 82, suppl. p. 10). It is a familiar fact that insects will react more definitely to some spectral colors than to others and this trait has been utilized in California in combating the plum moth which has destroyed as much as 25 per cent of the artichoke crop. Experiment showed that these insects are attracted by light-blue and traps composed of a light-blue electric bulb surrounded by electrically charged wires were used. The insects coming to the light were killed by contact with the wires. It was reported that at a cost of about \$30 an acre the artichoke losses were reduced from 25 per cent to 3 per cent. The trap proved also useful in vineyards where it killed the grape leaf hoppers (*Science* 82, suppl. p. 9). In New Jersey it was found that a mixture of light petroleum oil with pyrethrin gave particularly good results in mosquito control.

Four to five gallons of this mixture would do as much execution on the insects (both larvae and adults) as 35 to 40 without the pyrethrin. Sprayed in the air this keeps mosquitoes away for from 4 to 5 hours. It is not poisonous to man and domestic animals (*Science* 82, suppl. p. 8). An Imperial Entomological Conference was held in London in September (*Nature* 136, p. 652). Discussions at this conference mostly dealt with the problems of termite and locust control. With reference to the latter insect and its injurious swarming outbreaks in Africa it was thought feasible to control the pests through prompt dealings with the centres of the outbreaks where the swarming phase of the insects originates. The sixth International Congress of Entomology was held at Madrid in September, with I. Bolívar Urrutia as President.

The mating behavior of the praying mantis (*Mantis religiosa*) was described by Roeder (*Biol. Bull.* 59, p. 203). In this insect the female is larger and stronger than the male and is very voracious so that the male is in great danger of being eaten if the female can catch him. The female has poorer vision than the male and both recognize other insects only if these are in motion. The male usually sees the female before she sees him and immediately "freezes" into a fixed rigid posture which may last for hours. This protects him from attack by the female and at the same time he is able to keep informed of her position by slight movements of her antennae, wings, etc. Guided by these movements he is able to approach her very slowly and if he comes near enough to touch her with his antennae he jumps on her back in which position he is safe from attack. Then follows a series of definite bending movements of the male abdomen to which the female eventually responds by movements of

the ovipositor and the final mating is accomplished by the transfer of a spermatophore to the female.

This clasping phase may last for four hours. Since the insects are usually upside down at this time the male escapes being later eaten by the female by simply dropping down from her back. The normal male carries on the mating movements of the abdomen only when on the back of the female but if the cerebral ganglion is removed these movements begin as soon as the shock of the operation is past. Experiment showed that the last abdominal ganglion governs these movements which are normally inhibited by the cerebral. If a decapitated male is put on the back of a female he will be accepted and a decapitated female will accept a male either normal or decapitated. In this case the mating goes on more rapidly than if the animals are normal. In the female the inhibiting centre is the subesophageal ganglion. The author calls attention to a possible advantage to the race in this condition in that if the male is caught by the female before he reaches her back he may in his subsequent struggles get into the mating posture and mating be accomplished even if he is killed.

Mammals. The aberrant mammal *Ornithorhynchus* has imperfect dentition, lacking upper incisors and canines. Broom (*Nature* 136, p. 219), recorded observations which indicate that it probably is descended from a form having full dentition. The imperfect condition would therefore be regarded as one secondarily acquired and not ancestral. Gresser and Noback (*Jour. Morph.* 58, p. 279), reported that in the eye of the monotreme *Echidna* the shape of the lens and the structure of the retina are of the mammalian type while the cup-shaped posterior portion, a cartilaginous cup imbedded in the sclerotic and the curved cornea, are more like those found in the fishes and birds. Simpson (*Quart. Rev. of Biol.* 10, p. 154), thought that while the Age of Mammals began some 60,000,000 years ago, the first mammals came into existence about 12,000,000 years earlier than that date.

Mollusca. Hopkins (*Jour. Exp. Zool.* 71, p. 195), reported on the cooperative action of adductor muscles and gill ciliation in regulating the current of water flowing through the oyster and the relation of temperature to these processes. Relaxation of the adductor muscles is greatest at 20° C. so that at that temperature the water flow is at a maximum but the gills work most efficiently at 27°-28° C. Since the adductor muscles partly close the shell at such a temperature the action of the muscles is to serve as a brake on the gills. Hopkins (*Ecology* 16, p. 82), found that the sprat of the Olympic oyster *Ostrea lurida*, swim upside down with the result that they come into contact with the lower surfaces of solid objects and hence characteristically are found on the under surfaces of whatever solid support they have. During the year concerted attack was made on the enemies of the oyster fisheries from Cape Cod to Texas. In the Gulf of Mexico a planarian worm known locally as a "leech" was the most destructive and because its life history is largely unknown methods of control are not understood. The subject was under investigation at a laboratory at Apalachicola Florida. Boring snails were studied at Beaufort, N. C., and the starfish problem in Long Island Sound. To secure data on the extent to which starfishes migrate the animals were stained with a blue dye and turned loose, other marking methods having proved useless.

Protozoa. Ivanić (*Biol. Zent.* 55, p. 225), described copulation in the protozoön *Cochliopodium digitatum*, in which the process consists of a com-

plete fusion of two individuals. If both are devoid of nutritive matter the resulting zygote dies. If one has much nutritive matter and the other not, the first goes into the shell of the second where there is a complete fusion of nuclei and cytoplasm. Later this mass divides into a number of daughter cells which move out and form shells of their own. Ivanič thought that this division is a reduction and as a consequence the single animal is haploid. Other writers have questioned whether this is really a sex process. Giese (*Phys. Zool.* 8, p. 116), stated that *Paramacium* would conjugate if food is lacking and cease if food is provided. In this experiment the food was a pure culture of bacteria. Metabolites of the food and of the *Paramacium* may be present in high concentration without leading to conjugation. The conjugating tendency, however, varies with different clones. De Garis (*Jour. Exp. Zool.* 71, p. 209), found that conjugation in *Paramacium* gives rise to lines similar to one another but which may or may not be like the parents. New lines produced in this fashion are hereditarily different from the old.

Reptiles. Mosauer (*Ecology* 16, p. 13), described the reptiles of a sandy desert region in Coachilla Valley, 130 miles from Los Angeles, Calif. Some showed a very complete adaptation to highly specialized desert conditions while those in less specialized environments were more generalized in their structures. Reptiles that live where the temperature may reach 130° F. will nevertheless die as quickly as any if put in an artificial temperature as high as this. The probable explanation is that when under natural conditions they have some special means of regulation. Allard (*Sci. Monthly* Oct., p. 325), described some details of the natural history of the Box Turtles which were kept in an artificial enclosure but under as nearly as possible natural conditions. These animals mate soon after coming from hibernation and the eggs are laid in pits dug by the hind legs of the female, the average number being 4.2. Eggs kept in a warm room in Washington hatched in from 50 to 55 days while

those in the soil took from 69 to 105 days. It was suggested that the rarity of this species north of Massachusetts may be due to the cooler soil which is unfavorable for incubation. The young hibernate without previous feeding but in the second year eat voraciously and become very fat. In the latitude of Washington the hibernation is completed by November. The turtles will eat almost anything, being very fond of table scraps, and become tame enough to eat out of the hand.

Sex Determination. An important biological problem is that of sex determination. What decides that one individual shall be male, another female? As stated in earlier YEAR BOOKS it has been shown in many cases that a particular chromosome has a sex-determining value though the final result seems to be due to the cooperation of this with other chromosomes. Balzer (*Collecting Net*, 10, p. 101), reported results of experiments on *Bonellia*, an aberrant animal probably related to the annelids. The female is free living and has the usual complement of organs. The male is small, degenerate in structure, and lives as a parasite in the intestine and uterus of the female. The larvæ are at first all alike in external appearance, sex differences appearing later. If they develop in clear water about 5 per cent will be males, the others females. If they are reared where they can attach themselves to the trunk of a female about 70 per cent will be male. Similar but less certain results follow if larvæ are kept in extract of the female body. It would seem that the larvæ are potentially capable of developing into either sex and Balzer decided that two factors are involved in the final determination—1. an hereditary factor and 2. the influence of the environment, in this case probably hormones given off from the female body.

ZULULAND, zōō'lōō-länd'. A territory of the Province of Natal in the Union of South Africa. Area, 10,427 sq. miles; population (1921 census), 258,356 (European, 3985; non-European, 254,371). The European population at the 1931 census was 5790. Capital, Eshowe.
